**Tumor Cells in Body Fluids**—Helwig searched for tumor cells in sixty-five peritoneal or pleural fluids obtained from 56 patients. Paraffin sections of the fluids were stained with hematoxylin and eosin. In most instances several consecutive sections were made and examined on a morphologic basis without knowledge of the patient's history or of the cavity from which the

fluid was obtained. Of eighteen fluids reported as positive, fifteen were proved or presumed correct by biopsy, by examining the cavity at operation or at necropsy, by roentgen study or by palpation of a mass in the cavity, one was proved incorrect and the exact nature of two was not established. Of forty-seven fluids reported as negative the diagnosis of fifteen was proved correct, of fifteen it was presumed to be correct, of three it was proved incorrect, of eleven it was presumed incorrect and of four it was not established. In 2 of the 3 cases in which the diagnosis of the fluid was "negative for tumor cells" but neoplastic disease was present, ascites was associated with the neoplasm but in neither instance was it a manifestation of metastasis to the peritoneum. Obviously the ascitic fluid could not show tumor cells when the neoplasm did not involve the peritoneum and therefore the diagnosis was actually correct for the specimen examined. In the other case the ascitic fluid failed to show identifiable tumor cells, although a neoplasm involving the peritoneum was present at necropsy. The eleven fluids, from patients with clinical evidence of a neoplasm but whose body cavities were not examined, that were "negative for tumor cells" might have been influenced by some mechanism other than the direct peritoneal involvement by the tumor. Thus in any analysis conducted to judge the accuracy of the test it is necessary not only to know whether a neoplasm was present in the patient but also whether the serous surface of the particular cavity from which the fluid is withdrawn is involved. Even though a patient has a neoplasm, tumor cells cannot possibly be identified in fluid obtained from an uninvolved cavity. Fragments of tissue composed of stroma and acini or papillae, atypical mitotic figures and bizarre multinuclear cells are indicative of malignant cells. Desquamated cells from the lining of the serous cavities may be confused with tumor cells. Cells arranged in clumps or acini should be accepted as tumor cells only when they exhibit pronounced pleomorphism. Both positive and negative fluid may contain cells in mitotic division, cells with vacuoles, erythrocytes and fibrin.

**Diethylstilbestrol for Essential Dysmenorrhea**—Nine teen consecutive patients complaining of dysmenorrhea every month but having no organic disease of the pelvis were given "control" injections of estradiol benzoate and one or more courses of 1 or 2 mg of diethylstilbestrol daily by mouth for various periods. Sturgis considered the result of the diethylstilbestrol courses satisfactory only when the patients were free from any cramps in the month that treatment was given. In each instance the control injections satisfactorily eliminated pain during the next flow. The 19 patients received seventy-nine courses of oral treatment, and cramps were satisfactorily eliminated fifty-nine times. In the twenty failures pain was present during the flow immediately following treatment. The twenty failures occurred in 11 cases. In seventeen of these twenty courses treatment was started too late in the cycle to prevent ovulation, as the menses in each instance occurred less than three weeks after treatment was begun. One of the three other failing courses was started twenty-two days before the next period, emphasizing the difficulty of attempting to establish an arbitrary time limit for a given medication to produce a biologic effect. The other two courses were started thirty-three and thirty-four days, respectively, before the next periods occurred. It is believed that in these cases ovulation was delayed but not prevented by the medication. Diethylstilbestrol primarily inhibits the follicle stimulating hormone fraction of the pituitary gland and secondarily suppresses the growth of ovarian follicles and hence ovulation during the time that treatment is given. After a course of treatment is concluded the normal ovarian cycle is reestablished, and invariably dysmenorrhea is

recurs in about one month if therapy is not resumed. In about 20 per cent of the cases treatment must be discontinued because of gastrointestinal complaints, therefore the therapy is of value for temporary, rather than for permanent, relief.

**Manifestations of Thyrotoxicosis**—Morgan discusses the constitutional disorders, osteoporosis, myopathy, exophthalmopathy and avitaminosis, that are intimately associated with hyperactivity of the thyroid and which may be so conspicuous as to alter the usual pattern of thyrotoxicosis and lead to mistakes in diagnosis and treatment. Illustrative cases of each disorder are presented, and the conclusion is reached that the concept, expressed by Means in 1941, that thyrotoxicosis is a constitutional disturbance involving a complicated hormonal imbalance having widespread effects in which the thyroid is but one item is both sound and useful.

**Staphylococcal Pneumonia**—Baker states that in the course of the relatively mild epidemic of influenza that reached North Carolina in January 1941 several cases of pneumonia

developed, some of which led to rapid death. The pneumonia presented unusual appearances at necropsy, was regularly associated with the hemolytic *Staphylococcus aureus* in cultures from the lungs and was reminiscent of pneumonia of the great influenza pandemic of the first world war. The 4 cases studied at necropsy at Durham were characterized by ulcerative and diphtheritic tracheobronchitis and massive fulminating, edematous and hemorrhagic pneumonia. In addition to hemolytic *Staph aureus* being cultivated from the lungs, it could be demonstrated in the sections of the larger air passages and lungs in luxuriant growth. Necrotizing foci were present in the early cases and clusters of abscesses in the older ones. *Staphylococcal pneumonia* with this distinctive morphologic appearance in the larger air passages and lungs scarcely occurs except in association with epidemic influenza. It seems highly probable that the pathologic changes observed represent the combined effect of virus and bacterium. Evidence in the literature suggests that influenza virus in itself is capable of producing pneumonia in man and experimental animals (ferrets and mice). In most cases of epidemic influenzal pneumonia the concept of a synergistic action between virus and bacteria appears to fit the various observations.

**Thrombocytopenic Purpura Following Administration of Sulfathiazole**—Werner reports a case of thrombocytopenic purpura which was due to idiosyncrasy to sulfathiazole. The patient was given 139 Gm of sulfathiazole over a period of five days, at which time a slight rash developed. Twenty days later he was given 1 Gm of the drug, and purpuric symptoms developed within twelve hours. A thrombocytopenia existed, as no platelets were present. Sulfathiazole is not a harmless drug. Daily studies of the blood are important, as special changes may suggest an impending blood dyscrasia.

**Sulfaguanidine in Cholera**—Of 613 patients with cholera that Chopra and his associates treated, 301 were given 0.5 Gm of sulfaguanidine as an initial and 0.25 Gm every six hours for seventy-two hours as a maintenance dose, 218 were given 1 Gm of the drug as an initial and 0.5 Gm as the maintenance dose, and 94 control patients were treated only with saline solution intravenously. Of the first group of patients 282 were cured and 19 died, of the second group 211 were cured and 6 died and of the last group 88 were cured and 6 died, making the respective mortality rate 6.31, 3.21 and 6.38 per cent. The patients given the larger doses of sulfaguanidine required less saline solution than the two other groups. All the patients receiving chemotherapy had fewer stools per day. Larger doses than those used may be still more efficacious.

\*Infectious Diseases in Semiclosed Community S Thomson and A J Glazebrook—p 570

**Infectious Diseases in Semiclosed Community**—In the course of a year Thomson and Glazebrook observed 1,902 cases of tonsillitis and 115 cases of rheumatic fever in a training center with an average population of 1,200. The center had dormitories, classrooms, recreation rooms and hospital accom-

modations. All the recruits were passed as fit before entry. A quota from every batch of entrants was received at fortnightly intervals at this center. This probably played an important part in continuing the epidemic. The incidence of tonsillitis fell as the ages of the entrants rose. As the ages rose the incidence of tonsillitis among those not previously attacked fell in a geometric progression. Violent exposure to streptococcal tonsillitis in the absence of a clinical attack raised the resistance to a high level in a short time. Acute rheumatism did not appear among those who had been in the institution for a long time and had experienced several attacks of tonsillitis. There was no real difference in the incidence of the two diseases in boys drawn from different parts of the country. An epidemic of common cold did not occur in an institution in which conditions were favorable to its spread, but a severe epidemic of tonsillitis occurred during the period of investigation. In this institution the incidence of the common cold was related to the seasons, yet the conditions of living were the same all the year round. The attack of common cold left little or no resistance. There was no "silent" immunization against the common cold.

Effect of Electrotherapy on Denervated Muscles in Rabbits E Gutmann and L Gutmann—p 169

**Peritoneoscopy**—Walker and Playfair performed peritoneoscopy under local anesthesia in 95 cases, under general in 29 and under spinal in 1. General anesthesia was employed when it was probable that open operation would follow. Peritoneoscopy is usually called for as an alternative to an exploratory laparotomy and should be employed only when definitely indicated. It will save many patients the risk and discomfort of an open abdominal exploration. The authors have not encountered any serious complications, the only minor one being surgical emphysema of the abdominal wall in a few cases. Peritoneoscopy was found particularly useful in gastric and hepatic conditions. Of 32 patients with gastric carcinoma examined 9 showed metastasis and were considered inoperable. In 20 no metastasis was seen and laparotomy was undertaken, 11 had a subsequent gastrectomy, while at operation 9 were found inoperable because of an extension of the growth not seen through the peritoneoscope. In 2, no growth was seen with the peritoneoscope, but operation revealed a carcinoma, 1 patient without metastasis was not operated on because of a poor general condition. Of 18 patients with either palpable enlarged livers or ascites 10 showed malignant nodules, 4 cirrhosis, 2 hepatitis and 2 fatty degeneration. Of 8 with suspected cholecystitis or gallstones 6 showed a pathologic gallbladder, confirmed at operation, while in 2 the gallbladder appeared to be normal but at operation it was found to contain a single stone. The ovaries of 16 were examined, 8 because of menstrual irregularities, in 6 of whom multiple unruptured graafian follicles were revealed and in 2 polycystic ovaries, and 8 for ovarian cysts, 3 of which were malignant with peritoneal metastasis while in 5 the diagnosis was confirmed and the cyst subsequently removed. In 2 other patients who had had malignant ovarian cysts removed previously metastasis was found and confirmed at necropsy in 1. Of 8 patients with cervical or uterine carcinoma 3 had peritoneal metastasis, 1 hepatic metastasis and evidence of invasion of the broad ligament. Other conditions which have been diagnosed were ectopic pregnancy, metastatic retroperitoneal melanotic sarcoma, tuberculous peritonitis, tuberculous salpingitis, endometrioma and splenomegaly.

**Incidence of Acne in Men**—Cohen states that among 59 soldiers that he examined 59 had obvious acne vulgaris. The ages of the last 207 varied from 20 to 39 years. It seems that most authorities have put the upper age limit too low and that acne is relatively common in men more than 30, 8 of 51 between 30 and 39 had acne.

**Coarctation of the Aorta**—Salá-Panissello and González-Peña point out that coarctation of the aorta was as a rule detected accidentally in the course of a necropsy until modern methods of examination made its detection during life possible. They present a review of the literature on stenosis of the aortic isthmus and a classification of congenital anomalies of the heart. The prognosis is somewhat unfavorable because of the possibility of a bacterial endocarditis. As prophylaxis removal of all foci of infection is indicated. Digitalization may be required in some cases in order to maintain the hemodynamic equilibrium. The authors present the clinical history of a man aged 20 in whose shoulder a collateral circulation was discovered.

## Boletín de la Soc de Obst y Ginec, Buenos Aires

20 699 878 (Dec 30) 1941 Partial Index

- \*Placental Blood Transfusion Indications in Tocologic and Gynecologic Diseases G. Ricci and M. Balaguer—p. 830

**Placental Blood Transfusion**—Ricci and Balaguer believe that placental blood because of its high hormone content is of therapeutic value in obstetric and gynecologic diseases. The blood is aseptically collected from the placenta immediately after delivery. It is preserved in a solution of 5 Gm of sodium citrate, 9 Gm of sodium chloride and sufficient amount of twice distilled water to make 1 liter. The mixture of blood for transfusion contains the same amount of blood and of the sodium citrate-sodium chloride solution. It can be preserved for five days. Placental blood of the same group or from universal donors is used. Blood serum is obtained from centrifugated blood of the groups A, B and AB. It can be used without regard for blood grouping. Blood or blood serum is transfused in amounts of 20 cc every other day up to a total of six to ten transfusions. The treatment was given to ambulant patients with chronic and subacute adnexal disease, and disorders of menstruation. The patients exhibited transient local and general reactions of malaise, fever, aggravation of local pain and local inflammation which lasted for a few hours. The reactions diminished in severity as the treatment progressed. By the end of the treatment local pain, inflammation, vaginal discharge and swellings disappeared. Menstruation became regular and the patients were able to lead a normal active life. Recurrences were observed in 2 of 32 cases and were due to insufficient treatment. A new series of six transfusions completed the cure. In cases of juvenile and menopausal metropathies previous treatment and blood transfusion had failed. Placental blood transfusion controlled the hemorrhages and regulated menstruation. Good results were also obtained in grave puerperal pyelitis after failure of the usual treatments, including sulfanilamide.

Surgically Treated Subdural Hematomas Four Cases I. Alessandrini and H. Lea Plaza—p. 24  
\*Sulfadiazine in Treatment of Meningococcic Meningitis A. Horwitz J. Perroni R. Kraljevic and J. García Huidobro—p. 31

**Diagnosis and Treatment of Peripheral Arterial Disorders**—Zúñiga Latorre discusses the treatment of acrocyanosis, erythromelalgia (Weir Mitchell), Raynaud's disease, thromboangitis obliterans, localized obliterating arteriosclerosis, generalized obliterating arteriosclerosis, syphilitic arteritis and diabetic arteritis. Although these disorders represent distinct clinical entities from the point of view of pathologic anatomy

they are gradations of an arteritis which is functional in the beginning, spasmatic in its later course, obstructive and causing in the end stages, grave lesions in the arterial coats. The etiology of the syphilitic and diabetic arteritis is known, the cause of the others has not been determined. The author has treated surgically since 1927 107 cases. In his experience ganglionectomy gives the maximum assurance of cure in thromboangitis obliterans while the operative risk is small. Medical treatment must complement the surgical but by itself cannot cure the thromboangitis. There exist two causes of vascular spasm in thromboangitis obliterans: a general, endocrine, adrenal, which maintains the hypertony of the sympathetic, and a local arterial, which originates in the nervous fibers of the wall and is brought on by an obstruction of an artery, which in turn provokes a spasm in the entire collateral network. The effect of the surgical treatment on the latter is so certain and permanent that it counteracts to a large extent the primary cause and prevents grave alterations. Moreover, ganglionectomy seems to exert a direct influence on the general cause. The author tried to induce both effects in some patients by performing a paravertebral ganglionectomy to eliminate the second cause of spasm and splanchnicectomy, freeing or extirpating the semilunar ganglion to attenuate the first. The results obtained have been optimal but the majority of cases demonstrated that ganglion extirpation to the customary extent is sufficient to obtain definite clinical improvement. The operation is indicated in all cases in which the collateral network still reacts. It is contraindicated in generalized arteriosclerosis and in diabetic gangrene. Medical treatment should complement the surgical therapy. Early diagnosis is important in order that surgical treatment may be performed in time to avoid mutilating amputations.

**Sulfadiazine in Treatment of Meningococcic Meningitis**—Horwitz and his collaborators administered sulfadiazine in 38 cases of meningococcic meningitis. The mortality so far has been zero. This is noteworthy when it is considered that with the use of other sulfonamides the mortality fluctuates between 8 and 10 per cent. The initial dose was 4 Gm and was followed by 1 Gm given every three hours. The average duration of the treatment was 8.5 days. The average total dose was 60 Gm but many cases were cured with 30 Gm. Because of the low toxicity and the favorable results sulfadiazine may eventually replace nearly all of similar drugs.

\*Atropine and Iron in Treatment of Gastric Ulcer A. Henszelmann—p. 684

**Atropine and Iron in Treatment of Gastric Ulcer**—It is not generally appreciated that in large doses atropine exerts a therapeutic effect by way of the sympathetic. It has a paralytic effect on the parasympathetic nerve terminations. In this way a spasmolytic effect is exerted on the smooth muscles and the secretion of the digestive glands is inhibited. The spasms of the smooth musculature, irritation of the antrum, hypertonia, insufficient opening of the pyloric sphincter and the contraction of the antrum are the result of nervous hyperirritability. By counteracting these spasmodic contractions with atropine rest is secured, which is necessary for the healing of the ulcer. The customary doses of atropine do not have this effect. Henszelmann found that intravenous administration of atropine sulfate solves this problem. Depending on the nature of the case, he administers daily for ten or twenty successive days from 0.33 to 0.66 mg of a 1:1,000 solution of atropine sulfate. Reduced iron is given three times daily in doses of from 0.1 to 0.2 Gm. Intravenously administered atropine heals the peptic ulcer more rapidly than does protein treatment, amino acid or any other treatment. In the presence of hemorrhages the atropine treatment is combined with the administration of reduced iron. The ferrous chloride formed by the metallic iron and the hydrochloric acid exerts a local hemostatic, astringent and coating effect, it promotes granulations and has an acid neutralizing effect. Its strengthening and hemopoietic action counteracts the predisposition to hemorrhage.

## Book Notices

**Encephalitis A Clinical Study** By Josephine B. Neal, A.B., M.D., Sc.D., Associate Director, Bureau of Laboratories, Department of Health, New York et al. Foreword by Hubert S. Howe, A.M., M.D., Clinical Professor of Neurology, College of Physicians and Surgeons, Columbia University, New York. Cloth. Price, \$6.75. Pp. 563, with 16 illustrations. New York: Grune & Stratton, Incorporated, 1942.

The common worldwide and devastating disease encephalitis has become familiar to every physician. This book satisfies a present need. The difficulty in seeking information on encephalitis has not been that so little but that so much has been written on the subject. To have the accumulated information and the relevant world literature brought up to date is an accomplishment of merit.

Since 1918 Dr. Neal has been actively and prominently interested in this field. In the spring of 1927 Mr. William J. Matheson, himself a sufferer from encephalitis, gave generously to make possible exhaustive study of this disease. As executive secretary of the commission established by his grant, Dr. Neal and her associates could give their entire attention to the care of more than 700 patients afflicted with the disease. In addition, her experience with more than 200 patients who had acute infections of the central nervous system as diagnosed by the members of the Division of Acute Infections of the Central Nervous System of the Bureau of Laboratories, Department of Health, New York City, of which Dr. Neal is in charge, gave her the background necessary for an appraisal of the problem. No other person has had such wide experience in this field. The presentation in a single volume of such a wealth of experience in itself reflects thoughtful preparation of the work.

The book is introduced by historical and clinical orientation of encephalitis. Dr. Ralph S. Muckenfuss next considers the epidemiology of the various types of epidemic encephalitis. Chapter III, written by Dr. Neal and Dr. Helen Harrington, deals with the neurologic complications that may follow measles, German measles, vaccination, smallpox, antirabic treatment, whooping cough, scarlet fever, pneumonia and other bacterial infections. In chapters IV and V Dr. Neal covers the clinical course and the medical treatment admirably and includes the results of a vast amount of long, difficult and original work. The salient features of the surgical treatment of postencephalitic symptoms are briefly but, for the medical reader, adequately presented by Dr. Tracy J. Putnam. In chapter VII Dr. Albert A. Rosner deals with the psychiatric sequelae of epidemic encephalitis, and in the next chapter Dr. Lauretta Bender provides the reader with an informative survey of the postencephalitic disorders in behavior of childhood.

In the last chapter Dr. Lewis D. Stevenson describes clearly and well, with the help of illustrations, the pathology of encephalitis lethargica, congenital and infantile encephalitis, hemorrhagic encephalitis, St. Louis encephalitis, Japanese encephalitis, influenza encephalitis, acute disseminated encephalomyelitis and neuromyelitis optica, multiple sclerosis, the encephalitis of measles and German measles, postvaccinal (cowpox) encephalitis, the encephalitis of smallpox, chickenpox, mumps, scarlet fever, choriomeningitis, typhus fever, Rocky Mountain spotted fever, rheumatic fever and chorea, equine and other animal types of fever transmissible to man, rabies, louping ill, psittacosis, virus myelitis, tularemia encephalitis, animal encephalitis not transmissible to man, encephalitis of malaria, trichinosis and cysticercosis, toxoplasmic encephalomyelitis, trypanosomiasis, purulent encephalitis, the North Dakota epidemic, the Guillain-Barré syndrome, some less usual forms of encephalopathy and botulism.

It will be seen that the book covers much territory, but it does this well and with evidence of authoritative acquaintance with most of the material. The more recent views concerning the place of nutritional deficiencies in the brief reference to Wernicke's syndrome are omitted. This condition, however, belongs to a group that is not related primarily to infections. The book is well indexed. It is widely useful, and most physicians will find in it the information they are likely to seek expressed in words they will understand.

**Anquilostomiasis y paludismo en Venezuela** Por el Dr. R. B. Hill y Dr. E. I. Benarroch. Paper. Pp. 204, with illustrations. Caracas: Editorial Elite, 1940.

This book contains a general outline of conditions affecting health in Venezuela, including topography, climate, living conditions, population in general and the activities of the public health department followed by reports of hookworm and malarial surveys carried out in 1927-1928 in Venezuela by the International Health Division of the Rockefeller Foundation in collaboration with the Venezuelan National Health Department. Following the introductory statement there appears a bibliography of articles published separately by the authors in various journals in South America and the United States during the period 1928-1934 inclusive. Four of these articles are reproduced in an appendix.

The first three chapters of the book, setting forth acknowledgments, discussing general conditions and dealing with the activities of the Venezuelan Health Department, are a frank discussion of public health in Venezuela, the failure of administration of public health measures by the Public Health Department, and of the developments necessary to improve the public health in that country. Chapter IV is a report of findings of an extensive hookworm survey in the northern coastal and plain states, the mountainous areas of Lake Maracaibo northward to the Caribbean Sea, and the state of Bolívar lying south of the Orinoco River. The high incidence of hookworm infection found throughout most of these areas, making up an average of 69 per cent infection of the 11,235 individuals examined, is astounding. Chapter V is the report of the study of malaria carried out for the same general area and is an excellent presentation of the malaria situation in Venezuela, including the prevalence of malaria as based on more than four thousand spleen examinations and more than three thousand three hundred blood studies, the species and the distribution of species of anophelines and a discussion of the agricultural and industrial practices producing large breeding areas for anopheline mosquitoes. Chapter VI is a more detailed report of general health conditions and especially of malaria and anopheline mosquitoes in the general area of the city of Maracay. An appendix in chapter VII deals with various notes of interest, such as a report of the necropsy in a case of cerebral malaria, an experiment with epinephrine for the reactivation of malaria parasites and the use of gumme. The articles reproduced in this appendix discuss the various anopheline mosquitoes found in Venezuela, the feeding habits of Venezuelan anophelines, notes on the frequency with which various malarial parasites are encountered and a study of the various malarial parasites and notes on their frequency.

This book is recommended as presenting a comprehensive picture of general health conditions in Venezuela with detailed information on hookworm, malaria and the anopheline mosquitoes. The binding and paper are poor, and the photography, while adequately giving an impression of the great health problems to be encountered in Venezuela, is of inferior quality. Numerous tables and charts summarize the surveys. Vital statistics based on official reports of the Venezuelan Health Department are obviously inadequate.

**Anatomy of the Nervous System. A Textbook from the Developmental and Functional Point of View and Atlas of the Nervous System of Man** By Olof Larsell, M.A., Ph.D., Sc.D., Professor of Anatomy, University of Oregon Medical School, Portland. Cloth. Price \$6.00. Pp. 411, with 341 illustrations. New York & London: D. Appleton-Century Company, Inc., 1942.

This is a revision and enlargement of a previous book by Larsell, "Textbook of Neuro-Anatomy and the Sense Organs," reviewed in THE JOURNAL, May 20, 1939. Although the present volume is an improvement over the previous one, a number of the confusing statements pointed out in the first review persist in this volume. On page 103 is the statement "injury to the [spinal] cord which affects this tract [the anterior spinothalamic] results in failure of tactile and pressure sense to reach the brain," while on page 116 it is stated that "destruction of the anterior spinothalamic tract, 'touch and pressure sensibility remain virtually intact' because 'the fine touch fibers' sensibility, however, is also served by fibers in the posterior funiculus." And on pages 104 and 105 Stopford is quoted as

approval to the effect that the fasciculus gracilis and fasciculus cuneatus, the principal tracts of the posterior funiculus, have to do only with position senses and two point discrimination. The reviewer is aware that these apparently contradictory statements are, at least in some measures, susceptible of explanation, but does the first year medical student for whom this book was written know it? Neuroanatomy is one of the most difficult subjects that the young student encounters. Every effort should be made to have this intriguing and important subject as interesting and as free from confusion as possible.

Although the important lateral spinothalamic tract has been added to figure 112, it is still not indicated on most of the diagrammatic figures of the brain stem (figs 110, 114, 116, 119, 123). The erroneous implication that Walker and Le Gros Clark found evidence that some of the fibers of the optic radiation to the cerebellum cortex arise in the pulvinar has also been allowed to persist (p. 292).

These points are particularly annoying in that they persist in spite of having been called to the author's attention. They are not serious perhaps but they are not the only inconsistencies. For example, on page 254 is the erroneous statement that the posterior lobe and pars nervosa of the hypophysis are synonymous, on page 260 that the basal ganglia are found in the floor and ventrolateral wall of the cerebral hemisphere, on page 268 that the external capsule lies between the thalamus and the claustrum, to mention a few.

On the whole the book is carefully written. The illustrations are well chosen and well reproduced. There is a good bibliography and a useful index. The volume will prove to be a useful textbook for students in neuroanatomy.

Atti del Convegno sulla silicosi Torino 22-23 febbraio 1941. Edizione dell'Ente nazionale di propaganda per la prevenzione degli infortuni. Cloth. Price 60 lire. 1 p. 236 with illustrations. Turin: S. A. N. Stamperia Artistica Nazionale [n. d.]

The convention reported in this publication represents an attempt to bring together physicians, engineers, chemists, physicists, jurists, sociologists and economists for a discussion of the problem of silicosis in industry.

The collection of papers presented cannot readily be construed as an extension of the already existing knowledge of the disease; rather, it is an affirmation of its vital and ever increasing significance and a recognition of the varied sources from which must come contributions toward its ultimate solution.

The papers possess a commendable degree of homogeneity, consecutiveness and readability despite their multiplicity of authorship. They are in essence a compilation of basic information—a summary of the salient issues presented by the disease. Among the phases specifically considered are the pathology of silicosis, roentgenologic diagnosis, clinical diagnosis, prevention, medicolegal evaluation and insurance and employer liability.

It is obviously difficult to abstract from the reports items of preeminent general interest. The individual reader with individual interests will naturally find points of value on the basis of his own relation to the problem and his own predilections. References to the context are therefore of more or less arbitrary selection and are offered not with the implied suggestion that they are the primary contributions of the work but with the view of merely indicating the range and character of the material the reports cover.

In the paper on pathologic considerations, Professor Mottura of the Royal University of Turin refers to the slight compromise of pulmonary function attributable to the silicotic nodule *per se*. He makes mention of the alveolar compression and final obliteration consequent to massive sclerotic changes. Reference is also made to the possible difficulty of detecting slight tuberculous disease in the silicotic lung.

The need of supporting the roentgenologic findings by an adequate anamnesis before a definite diagnosis of silicosis can be made is mentioned by Professor Lupo of the Maggiore Hospital of Novara.

Concerning the removal of the affected subject from his work, Professor Vigliani of the University of Turin urges the reminder that such removal does not guarantee arrest of the process nor does it obviate the danger of tuberculosis. The psychic dangers to the worker, the possibility of seeking employment by concerns less meticulous in their examination and the danger of

doubling the number of the silicotic through replacement of affected workers by others are discussed.

Professor Baader of the University of Berlin states that the number of grave cases of silicosis in the old reich reported during the first nine years following the legal institution of compensation for such cases was 38,500 and that up to January 1938 the benefits paid to the silicotic and their heirs amounted to 65,000,000 marks. He avers that "the fight against dust is impossible without good organization and without methodical instruction of the workmen."

The reports of the Turin convention are of primary interest to the industrial physician and others directly concerned with the ever important question of silicosis. However, the papers could be read with profit by the internist and the student of pulmonary disease.

Clinical and Experimental Histological Studies on Effects of Salicylate and Quinine on the Ear. By Jørgen Falbe Hansen. Translated from Danish by Hans Andersen M.D. Denne Afhandling er af det lægevidenskabelige Fakultet antaget til offentlig al forsvares for den medicinske Doktorgrad. København 1941. Paper. Price 10 Danish kroner. Pp. 216 with 12 illustrations. Copenhagen: Einar Munksgaard 1941.

The war apparently has not been able, even in Europe, to smother entirely the type of detailed clinical study represented by this monograph, which evidences a great deal of work and is in the true continental style with full preliminary remarks on the pharmacology of the drugs investigated, namely salicylic acid and quinine, and it includes an extensive critical survey of all available pertinent preexisting contributions on the subject of the author's studies. He then relates the manner in which he tested hearing and labyrinthine functions in order to establish normal criteria. Under proper controls both tuning forks and the audiometer were used, healthy volunteers were examined after ingestion of sodium salicylate and quinine sulfate, patients with abnormal hearing were similarly tested and there were a number of instances in which individuals with acute quinine poisoning and protracted salicylate ingestion were observed. There were, in addition, controlled animal experiments with microscopic examinations of the internal ear after lethal doses of quinine sulfate and sodium salicylate. The author's conclusions were that in the main, 0.6 to 1.5 Gm. of quinine sulfate as a single dose or fractionated over a period of six hours produced deafness of the conduction type which, as a rule, cleared up in twenty-four hours. The same was true of single or fractionated doses of sodium salicylates to the amount of 3 Gm. or over. No permanent aural changes were noted. The microscopic studies show changes in the cells of the spiral ganglion, in the organ of Corti and in the position of the membranes. Hypothetically this may be due to an increase in secretion of the labyrinthine fluids, especially the perilymph induced by the drugs used. The increased endolabyrinthine pressure acts on the fenestra and explains the aural findings. Those interested in the effects of quinine and salicylates on the ear should read this work. It seems carefully done and differs in its conclusions from commonly accepted opinion to date, which appears to feel that quinine and the salicylates, when they adversely affect the hearing mechanism, produce a perception type of deafness which is often more or less permanent.

From Infancy Through Childhood. By Louis W. Sauer M.D. Ph.D. Assistant Professor of Pediatrics, Northwestern University Medical School, Chicago. Cloth. Price \$2. Pp. 200 with 17 illustrations. New York & London: Harper & Brothers 1942.

This book was written for mothers who are intelligent enough and well educated enough to use a book of advice in connection with the rearing of a child. It is not planned to replace the physician but to aid him. The discussion takes up the care of the mother through pregnancy and the nursing period, the care of the child in infancy and through various stages of development. There are special sections dealing with the prematurely born infant and the adopted child. In the appendix are a glossary, charts concerning immunization and record of weight and height, also some information on first aid. The reputation of the author gives assurance of the authoritative character of the advice given. Some sections of the book are technical so that the mother may require a dictionary or supplementary information from her own doctor in addition to the material in the book itself.

## Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

### EFFECT OF SMOKING ON APPETITE AND ON PERIPHERAL VASCULAR DISEASE

**To the Editor**—It is claimed that smoking lessens the appetite, many women who are anxious to reduce take up smoking. How does it bring about this result? What is the effect of tobacco on metabolism, especially the metabolism of carbohydrates? Does smoking cause hyperglycemia (temporary)? Why is smoking considered harmful in peripheral vascular disease?

M D, Michigan

**ANSWER**—That smoking lessens appetite and interferes with weight gain is one of the few claims in cigaret advertisements which have been substantiated by clinical and experimental observations. The ill effects of the induced anorexia were discussed in an editorial in *THE JOURNAL* many years ago as follows: "The human appetite is a delicate mechanism, and the attempt to urge that it be aborted or destroyed by the regular use of tobacco is essentially vicious." Temporary elevation of the blood sugar following smoking—reported by several, but not all, observers—varies with the dose and the subject and seems too small to account for the effect observed. Local effects on taste buds, the mucous membranes of the mouth and the upper portion of the alimentary tract in general and on gastric secretion and motility appear more plausible. The central effect of nicotine, inducing nausea in novices, may also play a part. Some of the effect, however, may be due to psychologic mechanisms, such as preoccupation of attention on smoking diminishing the tendency to nibble or eat for psychic reasons and conditioned reflexes set up by after dinner smoking leading to the cessation of hunger pains.

The effect of smoking on peripheral vascular disease is ascribed to the peripheral vasoconstriction caused by nicotine. This is shown by pallor, reduced temperature and lowered volume of the extremities after smoking. It is best exemplified in the unanimous condemnation of smoking in cases of thromboangitis obliterans but may be noted also in other disease states and in normal persons.

### INGROWING HAIRS

**To the Editor**—A man has been troubled for the past year with a condition involving the roots of the hair of the face. He shaves every day but never seems to get a clean shave because some of the hairs have a tendency to curl on themselves and turn into the skin. They seem to become encysted and when pulled out always have a hyaline-like sack involving the root and most of the lower portion of the hair. This condition has spread. I should like to know (1) the name of the condition, (2) what can be done to prevent the hairs from growing inward and (3) what can be applied to the skin to prevent further formation of the hyaline-like sacks?

M D, Massachusetts

**ANSWER**—1 The condition is a common one, but there are very few articles on it in the literature. It is known as *pili incarnati* and commonly called ingrowing hairs.

2 The only way to prevent the hairs from growing inward is to keep them pulled out or to have them permanently removed by electrolysis.

3 There is no medication which applied to the skin will prevent the formation of the cysts, which are more often pustules. They result from the irritation caused by the penetration of the skin by the hairs, without emerging from the follicle on the skin surface the hairs often bore along in the superficial corneum, through which they can be seen as though through ground glass, or emerge from the follicle and then reenter the epidermis, forming an arch or bridge. From this point the

course of the hair may be seen as it passes superficially, or it may go deeper and disappear from sight. The resulting papules, cysts or pustules are oftenest between the follicle mouths, because the hairs that emerge and then reenter the skin are more common than those that remain in the follicle or begin boring without emerging. Sometimes, however, as Weninger (*Sur les poils incarnés, Ann de dermat et syph* 9 687 [Aug] 1928) reported, the inflammatory reaction occurs at the follicle mouth and the hair can be fished out of the center, where it has lain curled up. As mentioned by the Suttons (*Diseases of the Skin*, ed 10, St Louis, C V Mosby Company, 1939, p 1394) this suggests keratosis pilaris, the horny skin-colored papules resembling goose flesh seen often on the arms about the elbows or on the outer side of the legs, sometimes elsewhere and occasionally on the cheeks and submaxillary regions, the favorite location of *pili incarnati*. Sofoteroff (*Das Harr als Ursache von Neuralgien, Zentralbl f Chir* 55 841 [April 7] 1928) reported on 4 patients, 2 of whom had painful nodules, the largest the size of a cherry, in the axillas, the other 2 had similar nodules in the pubic region. In these nodules, which showed no outward sign of inflammation, he found curled up hairs the removal of which relieved the tenderness and pain. This suggests an unusual form of keratosis pilaris. The lesions of *pili incarnati* are usually inflamed, partly because of a foreign body reaction to the presence of hair in the skin outside the follicle and partly because of external irritation from shaving and attempts to get rid of the hair. Most writers on this subject have thought of a possible relation to dystrophies of the teeth and nails and have recorded the absence of these but have not mentioned the presence or absence of keratosis pilaris in its common locations.

The reason for the localization of ingrowing hair at the side of the neck just below the jaw is that this is the meeting place of two opposing streams of hair, well depicted by Danforth (*Studies on Hair, Arch Dermat & Syph* 11 804 [June] 1925), who writes in explanation (p 820) "The natural direction of the hair in the submaxillary region is downward, while in the lower part of the neck it is upward, the two streams meeting in a line well within the beard covered area of most men. Despite the frequent irritation that comes from shaving against the natural direction of the hair on the part of a considerable proportion of men for many generations, this peculiar arrangement, apparently not shared by apes, still persists as a characteristic human trait."

Added to the confusion of hair direction is the fact that the hair in this region emerges from the follicles at an acute angle to the surface of the skin, favoring penetration of the skin by any crooked hairs. Keratosis pilaris might cause crookedness of the hairs. Both it and *pili incarnati* are familial in occurrence, and the association of these two and mild forms of ichthyosis should be investigated.

### SENSITIVITY TO EGG

**To the Editor**—For the past four years I have had during certain summer months a dermatitis of the hands. This varies in intensity. Not until a few months ago did I find by elimination diet that the dermatitis is due to egg in any form. Now the taking of egg in the slightest amount brings on this reaction without any seasonal relation. How can I desensitize myself, and where can I obtain the egg extract? What prognosis has the condition?

M D, Indiana

**ANSWER**—The diagnosis should first be confirmed beyond any doubt by eliminating egg in all forms, either as used alone or as employed in the preparation of other foods (such as cake, certain candies and ice cream). If egg is the sole cause for the dermatitis the condition should clear completely within a few days to several weeks, depending on the severity and chronicity of the cutaneous lesion. When the diagnosis is definitely established, one of two procedures may be followed. First there should be continuation of complete avoidance of egg in any form for several months to several years. In many cases considerable tolerance to a food develops after this type of avoidance. The length of time necessary is, unfortunately, not predictable. One might try a small amount of egg after six months of avoidance. If this is tolerated, egg may be used in the minimum amount necessary for a comfortable diet. It is inadvisable to attempt to approach the threshold of symptoms if tolerance is gained.

The second method is oral desensitization. It is not so easy to give a definite dose schedule that can apply to the individual case. The slower the immunization the more likely it is to be effective. For the extremely sensitive person one might start with a drop of raw fresh egg white added to a quart of water and a teaspoon of this dilution taken on an empty stomach once a day. If no symptoms occur the dose is doubled the next day by adding 2 drops of egg white to a quart of water.

increase is continued in this manner until symptoms appear. With the first appearance of redness or itching of the hands the taking of egg white is discontinued until the lesions clear. A dose about two thirds to one-half the one producing symptoms may then be taken daily, with occasional attempts to increase it. It after a number of trials the threshold of tolerance is found to be the same as in the original experience no attempt should be made to increase tolerance. The maintenance dose should then be about 50 per cent of the threshold dose. This is replaced by egg as used in the preparation of foods rather than a daily intake of raw egg white. Parenteral injection of egg white or other foods in an attempt to gain tolerance not only is usually unsuccessful but is often dangerous.

#### BITE OF A SHEEP TICK AND PROBABLE ERYSPELOID

To the Editor—While shearing sheep about three months ago a young man felt an insect bite him on the right hip. As soon as he was through he examined the spot and found a tick with its head buried in the skin. He pulled the tick off but the insect's head broke off and remained embedded in his skin. He attempted to remove the head but was unsuccessful. A small ulcer developed at the site of the bite and has not yet healed. About a week later he began to feel sick and a little feverish and has continued to feel that way although he has been well enough to do most of his work. A few days before he came to see me he noticed a rash on the thighs. The past history was noncontributory. Examination showed no abnormalities except a slight elevation of the oral temperature (99.6 F) a macular eruption on the thighs the lower part of the abdomen and the arms and the unhealed ulcer. There was no adenopathy. Blood was sent to the state laboratory in Hartford for Wassermann and agglutination tests. The Wassermann reaction was negative and reactions for typhoid O and H negative for paratyphoid A and B negative for brucellosis negative and for tularemia negative. The Weil-Felix test gave in a dilution of 20 a 4 plus reaction in a dilution of 40 a 3 plus reaction in a dilution of 80 a reaction of 2 plus and in a dilution of 160 a  $\pm$  reaction. The Weil-Felix test was performed on the X19 strain of *Proteus vulgaris*. I feel that the patient must have a rickettsial infection of some sort. I do not believe it can be typhus fever because he has not been sick enough. Have you any suggestions as to further diagnostic procedures diagnosis or treatment? Would it be worth while to try giving him sulfathiazole?

Norman P. Rindge M.D. Clinton Conn.

ANSWER—It is not certain whether the insect in question was a tick. Tick bites ordinarily do not hurt and many hours are required before the head is buried in the skin. It is possible that the insect was a sheep tick which resembles a tick but is actually a wingless fly. Its bite is painful, like that of the horsefly, and its head does become embedded.

The brief clinical description of the case does not resemble that of any known rickettsial disease either in its characteristics or in its long duration. The low titer of the Weil-Felix reaction is not conclusive. Incidentally typhus fever, like any other infection, varies greatly in severity and may indeed be so mild as to pass unrecognized.

In diagnosis several diseases may be considered. First of all is erysipelas, or swine erysipelas, which is commonly found among fish handlers and abattoir workers (Klauder, J. V. Erysipelas as an Occupational Disease, *THE JOURNAL* Oct 8 1938 p 1345). The causative organism has been found in sheep (Prausnitz, quoted by Pick, E. *Dermat. Wchnschr.* 35 292 1927) but no reports of actual infection from sheep are available.

Undulant fever is a possibility but not a very likely one. The ulcer may be secondarily infected with a fungus or kept open by the abrasive action of clothing. The possibility of a "new" disease is also to be considered.

Further diagnostic procedures would be attempts to culture the causative organism from the lesion. Sulfonamide therapy would be purely empirical if the cause was not discovered and experimental if it was discovered.

#### VACCINE IMMUNIZATION

To the Editor—What diseases do we prevent by immunization in vaccination?  
M.D. New York

ANSWER—The procedures generally regarded as the most reliable for active immunization are those used for the prevention of smallpox, scarlet fever, diphtheria, whooping cough, tetanus, cholera, typhoid and the paratyphoids, typhus fever and rabies. There are also preventative vaccines which are less commonly used and which are not generally available commercially. In this group is the vaccine provided by the United States government for protection against Rocky Mountain spotted fever and also one for the prevention of yellow fever. Vaccine for immunization against typhus fever has only recently become available on a large scale.

#### HEMOGLOBIN ESTIMATION

To the Editor—I have in my office the colorimeter the Sahli and the Dore instruments along with the Hellige type which used the ordinary colored standards of solid glass. Could you give me information as to which of these instruments is the most desirable for use for the average practitioner not especially trained in the use of the colorimeters but who wishes one that is rapid and reasonably accurate? M.D., Idaho

ANSWER—Satisfactory hemoglobin estimations for all clinical work can be made with any accurately standardized hemoglobinometer. The instrument used should be adjusted so the hemoglobin value of a normal subject with a red cell count of 5,000,000 reads 100 per cent. A hemoglobinometer can be standardized in any laboratory by making a correct erythrocyte count and hemoglobin estimation in grams on at least ten normal persons as illustrated in the following example.

| Patient No | Erythrocyte Count in Millions | Hemoglobin in Grams per 100 Cc of Blood |
|------------|-------------------------------|---|
| 1          | 4.92                          | 15.1                                    |
| 2          | 5.80                          | 16.9                                    |
| 3          | 5.02                          | 15.5                                    |
| 4          | 5.31                          | 16.5                                    |
| 5          | 4.57                          | 14.2                                    |
| 6          | 4.25                          | 13.5                                    |
| 7          | 4.78                          | 15.0                                    |
| 8          | 5.50                          | 16.8                                    |
| 9          | 4.65                          | 14.9                                    |
| 10         | 4.00                          | 12.6                                    |
| Mean       | 4.88                          | 15.1                                    |

The hemoglobin in grams per hundred cubic centimeters in the example cited is thus 15.4 Gm corresponding to 5,000,000 erythrocytes. If a colorimeter is employed for the determination a disk or standard with a color value corresponding to 15.4 Gm per hundred cubic centimeters could be utilized. A Dare instrument is difficult to standardize, but the same principle may be used.

The Sahli type instrument should have a glass standard. A square tube preferably marked in grams should be used to insure a uniform internal diameter. The calibration of the tube should be checked as described.

The Sahli hemoglobinometer if correctly made and standardized is probably the method of choice in most small laboratories. The principal difficulty with the original Sahli type is in telling when the match is correct as the specimen is diluted. This objection is overcome in the Sahli-Haden hemoglobinometer by the use of three color standards corresponding to 105, 100 and 95 per cent. The Haden-Hausser hemoglobinometer utilizes the Sahli principle of reading the hemoglobin as acid hematin but employs a fixed dilution of the unknown blood and a wedge of colored glass corresponding to varying hemoglobin values.

Some of the photoelectric colorimeters are satisfactory but expensive. The calibration has to be done as with any other color comparison method.

Hemoglobin readings with all methods will be satisfactory if the instrument is technically correct and properly calibrated.

#### RESPIRATORY DISINFECTANTS FOR BRONCHITIS OF CHILDREN

To the Editor—Why is it that children in certain European and Latin American countries apparently cannot recover from bronchitis without numerous injections of the so called respiratory disinfectants such as oil of eucalyptus, guaiacol and camphor while in the United States there is not a medical school that teaches the parenteral administration of such drugs in cases of bronchitis? Have they not proved to be valueless? I should appreciate references to any such study.

A. Rodriguez Macedo M.D. Mexico City Mexico

ANSWER—The literature on the value of the parenteral administration of the so-called respiratory disinfectants is meager and not conclusive. Nammack and Tiber in a paper on the treatment of lung abscess by means of intravenously administered guaiacol (*THE JOURNAL*, July 31, 1937 p 330), concluded that this therapy caused symptoms to subside and pathologic conditions to regress without unfavorable reactions. Most of the published studies deal with guaiacol or its esters. There is little evidence to show that when such preparations are administered orally they reach the respiratory system in any effective concentration. This was demonstrated by Bufalini as early as 1904 and the entire evidence for the use of such preparations was reviewed by the Council in *THE JOURNAL* Jan 15 1938 page 209. The parenteral use of guaiacol dates from observations like those of Hofbauer, who found that when guaiacol was injected hypodermically a small amount of it could be found in the lungs (*Therap. Monatsh.* 29 237 1915).

There is some evidence that guaiacol, if given intravenously in the proper form (free guaiacol rather than its soluble esters) and dosage, may be excreted by the lungs and appear in the sputum. However, controlled clinical studies on this phase of the problem are few. The evidence for the parenteral use of camphor and eucalyptus is negligible. It is doubted whether these drugs have any appreciable systemic action in therapeutic doses apart from reflex stimulation of the central nervous system. As a result of these meager data the parenteral use of the so-called respiratory disinfectants has not enjoyed much popularity in this country.

### SENSITIVITY TO ETHYL ALCOHOL

*To the Editor*—What would be the best method of desensitizing an adult person to ethyl alcohol? Sensitivity was apparently acquired by the use of a 70 per cent solution of ethyl alcohol dressings applied to compounded fracture wounds over a period of two weeks. Local applications cause a rather severe cutaneous reaction at the site of application. No reaction occurs from the use of other forms of rubbing alcohols. There is no previous history of allergy of any type. Fear of reaction has enforced total abstinence from all forms of alcoholic beverages, which were previously only rarely indulged in.

M D, Illinois

*ANSWER*—Search of the literature reveals no report of sensitivity of ethyl alcohol per se. Ethyl alcohol is made from various foods, especially wheat, corn, rye, barley, potato and fruits. Most likely the patient, if sensitive at all, is allergic to the food from which the alcohol is made rather than to the alcohol itself. If this is true the patient should be able to consume small amounts of ethyl alcohol made from foods other than the one shown to be the cause. Cutaneous and intracutaneous tests should be done with these various foods to determine if possible the source of the allergic reaction. If all tests are negative, trials with ethyl alcohol derived from various sources should be made, using small quantities. Desensitization to ethyl alcohol has never been done, as far as is known, but it could be tried by the oral method, the alcohol could be diluted with 1,000 parts of distilled water, the first dose would be 1 drop of this dilution, followed by 2, 3, 4, 6, 9, 13 and 20 drops, then give 1 drop of 1/100 dilution and increase to 20, then the 1/10 dilution, and finally the full strength ethyl alcohol could be tried, beginning with 1 drop and increasing 1 drop each time as far as expedient. The doses could be given every other day.

Local reactions to pure ethyl alcohol are also rare but can be tested for by the usual patch test, full strength of 70 per cent alcohol can be applied to a piece of gauze and laid against the skin for forty-eight hours. Contact dermatitis to ingredients mixed with alcohol to make rubbing alcohols is not uncommon.

### MIRROR WRITING

*To the Editor*—I have recently had referred to me a girl aged 8 who writes backward. She is of good general health and physique. She has moderate hyperopia, of +2.50 D in the right eye and +3.00 D in the left eye, with slight esotropia of the left eye. She uses the left hand in writing. She obviously has some mental deficiency. Will you kindly give me some information about this condition—diagnosis, cause and treatment?

I V Berney, M D, West Frankfort, Ill

*ANSWER*—There are two current theories of the cause of mirror writing. One of them has to do with cerebral dominance, i.e., the child is learning to use the left hand when she is really right handed by virtue of a left side speech center in the cerebrum, or vice versa. The other is interpreted in accordance with what the psychologist knows of eye and hand dominance, in that she is learning to use one hand, whereas to use the other one would be easier for her because of training and specialization factors. The visual defect would not be particularly important, except that a secondary reaction might develop from the child's mild anisokonia. The nature of the mental deficiency would be of some importance in determination of the cause, particularly if it was due to a birth injury, but it is obviously not correctable. The usual treatment for a condition of this sort is careful diagnosis in a psychologic clinic having among its personnel both speech and reading diagnosticians and therapists, followed by consistent retraining pointed at overcompensation for the special malaptitude. The assistance of a neurologist who has seen similar patients is sometimes of avail but is primarily useful only when the physician works with the reading expert.

The inquirer can get in touch with the Institute for Juvenile Research, 907 South Wolcott Street, Chicago, which has throughout the state branch clinics dealing with the type of treatment mentioned, to learn the date of the clinic nearest to West Frankfort to which he can send the patient. The institute works with the referring physician.

### "NORMOCHROMIC" ANEMIA

*To the Editor*—Occasionally difficulty is encountered in increasing the hemoglobin and the red blood cell count in hypochromic anemia in spite of ample dosage of thoroughly potent preparations, generally on exhibition of ferrous salts. All questions of blood loss, nutritional disturbances and the like have been satisfactorily eliminated. Recently certain authors have taken the stand that some individuals normally have a lowered hemoglobin and red cell count and apparently no amount of therapy will change this finding. I refer particularly to the work of the University of Iowa Medical School workers Fowler and Barer (*Am J M Sc* 201:642 [May] 1941). I should appreciate some opinion as to the worthiness of the above contention.

M D, Illinois

*ANSWER*—There is unquestionably a group of patients who have an iron deficiency anemia and who do not respond to iron therapy by an elevation of the hemoglobin content of their blood above a certain subnormal limit. If the color index or mean corpuscular hemoglobin concentration is low, one may usually attribute the lack of improvement to continued loss of blood or to defective absorption or utilization of iron or other substances necessary for hemoglobin formation. There may be abnormal hemoglobin loss or an inhibiting factor (e.g. infection). The most common cause of lowering of both red blood cells and hemoglobin so that a "normochromic" anemia exists is a chronic kidney lesion, often without albuminuria or hypertension. This condition does not improve with iron therapy. Some individuals have a low hemoglobin content of their blood over long periods of time and they are apparently in normal health. Under the circumstances this condition appears to be "normal" for these people, although it is pathologic in that it is beyond physiologic limits. It probably represents an equilibrium between the requirements of the body and its defective ability to make hemoglobin. All such cases are entitled to a thorough study to determine the cause of the abnormality. In some individuals of this type, correction of a lesion which was followed by an improvement in the hemoglobin content of the blood (lessening a tendency to bleed, removal of a chronic infection) the patients have volunteered the information that their present feeling of well being makes them believe that they had previously never known real health.

### PROSTITUTION AND PREGNANCY

*To the Editor*—In carrying out a program for the prevention of venereal disease, one encounters opposition to certain methods employed. In certain groups there is opposition to the use of the condom on the basis that this method prevents conception. It is my impression that, because of the high gonorrheal rate among prostitutes and the concomitant sterility pregnancy among this group of women is rare. Can you furnish any information on the relative frequency with which pregnancy has been observed in the prostitute? Of course, I am aware that it is difficult to draw a line between the professional and the "loose woman," who is also a prolific source of venereal disease.

M D, Mississippi

*ANSWER*—Pregnancy among professional prostitutes, especially those who have followed the vocation for some time, is not common. Percentage incidence figures are not available, for obvious reasons. If pregnancy does occur, usually an abortion, intentional or unintentional, is apt to occur. This is commonly followed by salpingitis, which bars future pregnancy. In this group there is apt to be either complete sterility or one pregnancy, sterility as the result of infections which cause tubal occlusion. In a series of more than 1,000 cases of gonorrhea in the female there were thirty-one pregnancies. There were no means of knowing how many of these were prostitutes. It would seem to be a rather low incidence of pregnancy in a rather large series of exposures.

### CHIGGER INFESTATION

*To the Editor*—In *Queries and Minor Notes* in *The Journal* (Aug 2, 1941, p 406) recommendations were printed for prevention and treatment of chigger infestation. While the suggestions possess some merit where only a small number of bites are concerned, they fall short of meeting the situations arising from children on vacation and soldiers on maneuvers. The submitted suggestion deals only with the relief of itching. Plain gasoline is the greatest factor in making a person hors de combat. Plain gasoline or carbon tetrachloride is applied with gauze or cotton by frassage to each local itching area, as if effort were made to dry clean the spot. In a minute a pleasant counterirritant effect is induced. Sleep seems to follow readily and will last three to four hours, when a second treatment is necessary, and is likely to be followed by a third application at the same time interval. New areas of itching are not infrequent as early as thirty-six to forty-eight hours and are dealt with in similar manner. Since clothing at exposure may continue to harbor the infestation, a change or rapid dry cleaning in gasoline is indicated. For availability and particularly for mass application it will be difficult to extract gasoline. (I have hesitated advocating leaded gasoline for safety—caution only.) Carbon tetrachloride is nearly as efficacious and is inflammable but should be used under well ventilated conditions. It may be of some interest to note that a drying and puckering of the lesions appear more rapidly than with other remedies suggested.

## THE RESPONSIBILITIES OF MEDICINE IN WARTIME

PRESIDENT'S ADDRESS

FRED W. RANKIN, M.D.  
LEXINGTON, KY

It is now a quarter of a century since the American Medical Association met during wartime to install a President. In 1917 its annual session was held in New York two months after the opening of World War I. Again we find ourselves involved in a global conflict the magnitude and implications of which are unpredictable and the ferocity, savagery and barbarity of its technic in comparison with wars of the past, unbelievable.

Since the armistice of 1918 the world has moved in a fluid cycle. Obvious currents of universal unrest and revolution have continued to accelerate their tempo to the final culmination in strife which is shaking the planet with furious frenzy. When European democracy and totalitarianism joined battle in September 1939, following the brutal subjugation of numerous small individual nations, with ruthless sacrifice of life and unbelievable destruction of property, it was evident to many that this revolutionary tide would sooner or later sweep us into its embrace. We applauded the gallant Anglo-Saxon spirit of the heroes of Dunkirk and the British Isles and aided their cause with monies and materiel, as we surely and inexorably approached active participation in the maelstrom of war. Throughout this period the vast majority of our citizens, with clear vision and resolution, followed enthusiastically all steps in the assistance of the allied defenders of freedom. They clearly envisioned that America could not live apart and that the destinies of the two hemispheres were inextricably intertwined.

Came Dec 7, 1941, and in the dawn of that Sunday morning a treacherous, characteristically foul attack on our defenses in the Pacific hurled this nation into an unsought war, which now engages our full effort. Unbelievable as this episode was, unthinkable to civilized man as it is that any enemy, without warning, should precipitate such an attack, the bitter losses of that battle, the bloodshed and wounds inflicted on our gallant forces at Pearl Harbor, were a worthy sacrifice in the cause of national unity. It is difficult to believe that the firm, unyielding unity which now is ours could have come so quickly, even after such an episode of infamy. Factionalism was forgotten, groups abandoned their hostile antipathy to one another, self-seeking units of our population laid down their quarrels, and one hundred and thirty million people became

true Americans within the hour. Today, at long last, the issue is joined and our position is clear. The inescapable struggle of our generation has begun, the ultimate test between the powers of a free world and a slave world is at hand, appeasement has failed, since it could only postpone the inevitable. Our test in the defense of democracy is beginning.

As one passes in review world events, it is clear that ideological casualties have been numerous and that processes of expediency, now as always, have dictated strange alliances. This is a war of unpredictable mutations and unprecedented paradoxes from which have arisen the strangest ironies of contemporary history. This war no longer masquerades under the guise of a struggle between ideologies, its hideous face has been unmasked as a conflict to destroy western civilization and gain world domination.

Our task both now and in the days and weeks to come, as each succeeding phase of the conflict develops, is a staggering one. Production of materiel, mobilization of manpower, the direction of war strategy and the administration of the vast economic problems which confront us are in the capable hands of our national leaders. To them the medical profession offers its all. Our part is the mobilization and utilization of all our facilities in the most efficient and helpful manner to the end that this struggle may be terminated successfully.

### MEDICAL MOBILIZATION

The mobilization of the medical profession actually began in June 1940, when the Surgeon General of the Army, with wise forethought and understanding of the situation, sought cooperation from the American Medical Association at its meeting in New York. Immediately thereafter work was begun on a plan, and the entire personnel of the medical profession has been mobilized and classified to implement the forces of the government in waging this war.

The initial step in this enterprise was the circularization by the medical profession itself of its entire personnel to determine the willingness of each individual to serve, his personal estimate of his own physical condition, and his professional capability. A second evaluation of every physician of the United States was carried out by fact-finding committees of his colleagues to arrive at a definite estimate of his professional capability in the eyes of his peers, as measured by experience and training. The result of these efforts was the accumulation of an enormous amount of data which were available to the medical departments of the armed forces and which would permit them to employ men in their proper numbers and in their proper professional niches under wartime conditions, thus avoiding much of the confusion, irritation and error which are inevitable under conditions of rapid expansion and mobilization.

President's address before the American Medical Association at the Ninety-Third Annual Session, Atlantic City, N. J., June 9, 1942.

A selective service act was enacted which, with its subsequent modification requiring the registration of all male citizens of the United States between the ages of 18 and 64, was of particular importance to the medical profession, affecting as it did all elements from premedical students to veteran practitioners. It was immediately recognized by all the authorities that the production of physicians up to the present output of the medical schools must be maintained. Consequently provisions were made to secure deferment of premedical students, medical students and first year interns under properly recognized conditions. These conditions assured the admission of graduates of all approved medical schools, who could pass the physical examinations, into the service of the armed forces after the internship year had elapsed.

The sympathetic understanding and farsightedness of the selective service officials, from the heads of the service down through the local draft boards, have been of inestimable advantage in handling these particular problems of medical men. It is one of the foundations on which the future successful distribution of professional services is based.

During the period of training there was but slight dislocation of the profession from its civil duties because of the availability of medical reserve corps officers, volunteers and men within the draft age limits of 21 to 36 years. With the opening of hostilities the immediate demand for large numbers of medical men necessitated another rapid expansion of the available professional forces, and with the elevation of the selective service age to a maximum of 45 years for combat duty it became immediately apparent that additional organizational steps were indicated. In consequence the Procurement and Assignment Service, under the Office of Defense Health and Welfare Services, was formed. This agency, representing the medical, dental and veterinary professions, is functioning to meet the immediate demands of the Army and Navy for additional men and to provide for future needs as the combat forces increase their personnel.

The additional circularizations by this agency have resulted in medical men volunteering for service in a capacity in which they themselves deem their services most useful. By the transference of these data from the roster of the American Medical Association's office in Chicago (a duplicate of which is kept in Washington) to a punch card system, the agency has been able to function wisely and effectively. The fact should be emphasized that there are available in this country only some one hundred and fifty to one hundred and sixty thousand practicing physicians of all ages, sex, color, creeds and physical states. It is reasonable to expect that, as the Army increases, more and more of the arduous military duties will fall on physicians in the lower age groups. The medical reserve corps has been exhausted. The entire personnel of the medical profession may be distributed efficiently through the Procurement and Assignment Service to meet military and civilian needs.

A greater and greater strain will undoubtedly be placed on medical resources in this country. There is no question that the demands on us will become greater, and unavoidably so in the ensuing months. Indeed, it is calculated that approximately twenty-five thousand physicians will be serving with the colors by the end of 1942.

The task of handling medical mobilization has been given to the medical profession by the Chief Executive

The job is ours. The complex and searching problems associated with its execution are our responsibilities. That these problems have been met courageously and with a minimum amount of confusion to the present time may not be gainsaid, nor is it too much to predict that the medical profession will continue its patriotic service in a manner consonant with its performances in the past under emergency conditions.

#### MEDICAL EDUCATION

The needs of both the military and the civilian population for adequate medical care emphasize the danger of reduction of either the present day standards of medical practice or the number of physicians. At present approximately five thousand physicians are graduating yearly from the seventy-six accredited medical schools of the country. When one considers, however, that the loss due to death, retirement and other causes is approximately three thousand a year, it becomes apparent that it is impossible to build a reserve pool of any size in a short period.

The standards of medical education in this country today undoubtedly are superior to those found in any other country in the world. Our public has available to it a quality of medical service elsewhere unsurpassed. One of the main problems in medical care is and has been for many years a distribution of talent, for admittedly the concentration of physicians in urban areas has been too great, whereas the dilution among rural populations has been a major and perplexing affair. However, this question of distribution of more physicians and of maintaining present medical standards is one which we can hardly expect to be satisfactorily solved during the present period. The method of production of more physicians and of maintaining present medical standards is one which demands untrusting scrutiny and should not be decided in a hurried manner under pressure of emergency.

#### POSTGRADUATE EDUCATION

Postgraduate education, as it is carried out at present, must inevitably suffer from wartime circumstances. Continuing education as it is applied to general practitioners and specialists differs materially because of the very nature of the essential instruction. The education of a specialist has been largely influenced by the wide spread adoption of the residency system of training. Within the past three decades this system of apprentice teaching in the wards, plus a long term service in the hospital after graduation, has spread to most parts of the country. It is definitely recognized, although somewhat belatedly in hospitals in many larger cities, that residencies are the most useful method of teaching young men surgical diagnosis, surgical judgment and handicraftsmanship under controlled conditions. The length of time devoted to specialized training in the various fields naturally differs but, measured by what ever yardstick one may use, ranges from three years upward, following a year's rotating internship.

That this type of training successfully answers the professional requirements of all specialized groups is beyond cavil, that it is practicable in wartime and under the stress of emergency is distinctly debatable. Younger physicians who have just completed or are in the process of completing a relatively long term of specialized instructions obviously comprise the group which can furnish most useful professional services in specialized fields to the armed forces, for the tempo of modern warfare is so exhausting even to those of superb physique.

cal statement that it is the policy of the War Department to utilize younger officers with troops if they can be found available. Because of these circumstances in which men in residencies and entering the age group for residencies find themselves, it is distinctly probable that much dislocation will be inevitable in postgraduate instruction in specialized fields. Nevertheless, the principles of continuing education along specialized lines must be recognized and adhered to with whatever flexibility allows its most advantageous adjustment in the mosaic of wartime medical education.

It is worth while to note here that an opportunity to continue their professional apprenticeship will be given, wherever possible, to those men who are in the midst of their specialty training and have been called into service. Some of the specialty boards have already agreed to apply the time spent in acceptable army hospitals on the training time required by that board. Only a small number of men can enjoy this privilege because of the exigencies of the times, but the principle of postgraduate education is so fundamental that it must be maintained in wartime in every available institution.

Basic principles in medical education must not be jettisoned, they may be held in abeyance, but the enormous damage which becomes unavoidable in the wake of war may be mitigated by every endeavor to maintain as high a level of both practice and education as is humanly possible.

#### RESEARCH

Research is a part of a planned postgraduate medical education, which languishes under the exigencies of catastrophe. To date the effect of the present day war on research has been to direct its attention mostly in channels of military medicine, and from these efforts unquestionably many advantageous developments in special research regarding useful drugs and other substances in the treatment of wounds, shock, infections and burns have resulted. The inevitable letdown in experimental investigation in postgraduate medical education may properly be bridged over but feebly during this period, yet a comprehensive view of the situation suggests that all efforts at maintenance of as many opportunities for scientific research as possible, within the emergency program, are necessary.

It happens that not infrequently science is exposed to programs and tendencies which, because of political considerations, may justifiably be viewed with little enthusiasm and often with forebodings. Obviously, scientific bodies must remain independent, their work should never be influenced by either political expediency or legislation. While it is easy to argue the thesis that such organizations remain within the framework of government, of necessity the hazards of governmental subsidization must ever be kept in mind because of "the danger that he who pays the piper may call the tune and that research may be required to be devoted primarily to objects which the politician, or the civil servant, regard for the moment as of national importance."

Research is a part of scientific development which no longer need be carried on in the sabbatical solitude of a laboratory but may be indulged in by all who wish. Every clinician, every practicing physician, is a research worker in a true and practical sense. Observation of symptoms, observation and recording of the action of therapeutic agents as applied to disease, and the correlation of clinical data are obviously of comparable

importance in the general scheme of application of medical knowledge. We clinical men of medicine must recognize the necessity of a proper balance between scientific research and clinical investigation and remember the urgent necessity of this dual approach to all problems of healing the sick. Tolerance should temper the interchange of views between the group of academic teachers habituated to investigation and that part of our profession inclined solely to clinical practice.

#### TRENDS IN MEDICAL PRACTICE

Among the interesting developments of the first questionnaire which was sent out to the medical profession was the surprising fact that only 41 per cent of the physicians classified themselves as general practitioners. Of the remainder, 25 per cent were classified as full time specialists and 34 per cent as part time specialists, the latter group indicating that they paid particular attention to some special line of work while at the same time carrying on a general practice. Thus it becomes apparent that approximately one medical man in three is devoting his entire time to a specialty. That these specialists are of varying degrees of proficiency and training is beside the point, for their numbers indicate definitely a trend in the practice of medicine which is apparently most satisfactory to both the public and the profession, and therefore the number of specialists is likely to increase rather than otherwise. Such a trend has been quite apparent to the most casual observer over the last two decades, and the profession itself, as is its wont, has taken steps to evaluate the capabilities of specialists through the establishment of authoritative examining bodies in fifteen special fields.

This development of specialty boards is a milestone on the road of medical progress which represents self-imposed restrictions and standards of training on physicians who elect to practice in limited fields. It is a part of the scientific discipline of medical men which began in the nineteenth century and has been maintained until today. These boards are like licensing boards, which were established primarily for the protection of the public except that they interest themselves only in standards of training, ethics and proficiency. They do not seek to interfere with any freedom of action of medical schools or licensing bodies or hospitals, and certainly their usefulness would be decidedly impaired should they undertake to arrogate to themselves such prerogatives. It should be emphasized here and now that these boards were formed by groups of specialists with the approval and consent of the Council on Medical Education and Hospitals of the American Medical Association and the Advisory Board of Medical Specialties. In no sense was pressure applied in their birth, and operation under the auspices of national authoritative bodies has been one of their basic principles. That they were formed in the spirit of idealism and that the members of the boards have performed a monumental service which has demanded sacrifice of huge amounts of effort and time from their various other duties is, I think, worth pointing out. As a member of one of these original boards, I can testify to the conscientious fairness and undeviating sense of duty with which each candidate, not only for certification by examination, but in the Founders' Group, has been scrutinized. It is with considerable pride that I assure you that in no instance as far as the Board of Surgery, with which I am most familiar, is concerned, has any decision been arrived at save on merit.

That there are two dangers from which specialty boards are not entirely free must be admitted first, that there be too many specialty boards and, second, that the boards, because of their very independence, make certain decisions affecting medical education or hospital staffs which could be adjudged either as arrogant or dogmatic and therefore harmful.

Relative to the number of boards, it may be pointed out that the Board of Internal Medicine, for example, has appointed a Committee on Medical Specialties in the fields of allergy, cardiovascular disease, gastroenterology and tuberculosis. Each candidate in these specialties must first pass the general examination of the parent board, and members of the board of examiners will sit in with the subspecialties in evaluating all candidates. This seems a wise provision if subspecialties are to be recognized by special certification, since it presupposes that the candidate is adjudged a competent physician in general internal medicine before he undertakes a more confined field of specialization. Too many boards for minor specialties can add confusion and destroy much of the usefulness of the general plan, but, as long as parent boards supervise examinations and give certificates only after the basic requirements of a major specialty have been satisfied, there is small likelihood of this development occurring.

Enthusiasm for service should continue to be one of the outstanding characteristics of specialty boards, but this enthusiasm should be tempered with common sense, practicality and freedom from any savor of applying pressure. That their programs must be flexible enough to meet changing demands is a truism, and that their decisions must be of an elastic form albeit tempered with resolution and foresight is essential to their continued usefulness. These boards have performed a service to the profession and the public by identifying the well trained and competent specialists, and for this accomplishment they deserve tolerant cooperation, thoughtful scrutiny and helpful constructive criticism.

#### OUR OBJECTIVES AND OBLIGATIONS

Our nation has now passed from a stage of prebeligerancy into a phase of mobilization and active participation in warfare. We have emerged from a stage of preliminary training to take station in battle lines. Our forces are already fighting on many battle fronts and in foreign seas. War is now our principal business, all national efforts are ancillary to its successful termination in a permanent peace by decisive victory. In this struggle the entire nation is mobilized and, as an integral part of its citizenry, the medical profession cheerfully and enthusiastically offers its all. Our profession is the trustee of the nation's health, and as such its obligations are to furnish adequate medical care to the armed forces while at the same time maintaining faithful service to the civilian population and productive war industry installations. It further demands that public health programs be cheerfully guarded, maintained or even increased as the need grows larger and larger. We are committed to the decision that provision for graduate education and for special education to develop specialists be continued at their present high level of efficiency. These and other essential duties which unfold continually in our daily duties must, and will be, accepted and accomplished to the extent of our capacity. In the inescapably somber times ahead, often our fortitude will be challenged, often our ideals will appear frustrated by circumstance, but the true mettle of a profession emerges only when tried in the fires of adversity.

Changes, unavoidable and unpleasant, face us in our daily and professional lives, we do not speak of the inevitable essential sacrifices, we speak rather of the glories of service. To serve is our destiny, to serve freely, faithfully and effectively is our wish and ambition.

Our duty is plain to see we shall go forward to our task, and we shall not fail.

271 West Short Street

## AIR RAID MEDICAL ADMINISTRATION IN ENGLAND

HUNTINGTON WILLIAMS, M.D., D.R.P.H.

Commissioner of Health

BALTIMORE

Air raid medical administration in England is merely one part of the general ARP services, Air Raid Precautions services, under the Ministry of Home Security or the Home Office, but the medical services are split between two ministries, the other half being the Emergency Medical Services which are under the Ministry of Health at Whitehall, just next door to the Home Office.

The three major subdivisions of blitz medical administration are the first aid services, the ambulance services and the hospital services. I would have you picture these as integrated most closely in the field or at the site of what the British call the "incident." This is a carefully selected word because of its minimum of panic producing power. At the site of a bombing the medical services are closely tied with all the other civil defense services—those of the air raid wardens, fire and police workers and the like.

The matter of "digging them out" is extremely important, one cannot do much first aid until the debris has been picked off mostly by hand. Let me recommend the phenomenally well written book called "Digging for Mrs. Miller." If you want a bad dream it will take you about an hour to get one, but at least you will know what the medical man, the rescue man, the digger, the stretcher bearer and all the others, firemen and policemen and allied workers, have as joint tasks. And this in London was not just occasionally—not for half an hour or an hour or two, not just for one or two nights in a week or a month, but twelve hours on end and ninety nights in a row. That was the blitz at its worst in London. This book was written by John Strachey, an air raid warden who went through these incidents in London, and he describes verbatim what the people say to one another as they are digging them out, what was said at the "incident" and at the hospital and as the families tried to find their kin or friends the next day.

The other best text is Colonel Prentiss's superior book entitled "Civil Air Defense," published by the McGraw-Hill Book Company. This gives a clear picture of the whole civil defense program as set up in England.

#### FIRST AID WORK

The English language is not the same on the two sides of the Atlantic Ocean. That is always a surprise and means that occasional key words have to be more or less translated. Here and there in this study of the administration of blitz medicine we had to translate English words into American English. For instance, in first aid

Read as a part of the Symposium on War Medicine in the Annual Postgraduate Clinic of the School of Medicine of the Washington University in Washington, D. C. Feb. 21, 1942.

work the first term you come to is "first aid party." That means a group of four trained workers and a leader and an automobile, what we would call a "squad." Then next is a "first aid post." That we would call a casualty station. It is a place in the neighborhood that has been set up in a protected basement and that word "protected" itself in a technical sense means that the ceilings and the walls have been so strutted and supported that if the whole building above is blitzed off the work can go on without disturbance. The word comes up in its technical sense in hospitals and ambulance depots and wherever any essential work is going on during a blitz.

The term "first aid depot" indicates protected sleeping quarters where the first aid workers sleep and rest because with ninety nights in a row of this kind of work naturally fatigue comes on. Here are double decker beds and strutted ceilings and walls so that there can be an opportunity to rest.

Another technical word in first aid is the "first aid point." I spent nearly a month trying to find one, and the explanation was simple—you couldn't find it in London because it is a rural first aid post that you would only find at a four corners in a county somewhere. Here there is a trained worker, man or woman, there are some bandages and splints and a stretcher and a telephone so that if there should be an incident in the neighborhood a wounded person could be cared for and then taken to a hospital or a mortuary. I mention mortuary with purposeful emphasis. This is a type of casualty service different from anything before, I believe. About one half of the casualties are fatal. You can imagine, with the buildings tumbling in all directions, that it would be so.

The first aid workers in parties or squads like all the other ARP or civil defense workers in England (and it is being developed similarly here) are specially trained for their work. They must enroll often as volunteer unpaid people and take courses of instruction, and then they are given insignia which they wear proudly, and those who have been through the blitz have developed the most superb morale and team spirit for mutual aid. The victims themselves in England have done likewise, so that things don't count any more, the matter in England that counts is to win the war, property damage doesn't seem to bother anybody so much, but it's "What can I do to help the person who is being blitzed down the street?" There is a really phenomenally spiritual element that has come in after the terrible blitz winter of a year ago. The officials in charge of the ARP service in the Home Office, and especially Wing Commander John Hodson, who is the Inspector General under Mr. Herbert Morrison, the Minister, were most gracious and helpful in the studies we were making. The Home Office gave us the latest reports of how improvements had been brought into their various services, and I can give you only a few examples because the time is short.

They discovered that an Incident Doctor, as he is called, was one of the most helpful in later developments. In other words, when a series of bombs have dropped—and they don't drop just one at a time, but they drop any number of explosives, not to mention these little incendiaries—all the services are called out, the fire, the engineering, the police and the medical services, first aid, ambulance and so on. There will be trapped casualties and there will be nontrapped casualties in different areas around perhaps ten or fifteen city blocks. Lately they have had what is known as an Incident Doctor, a resi-

dent usually of the neighborhood, called from a roster. He will have a corps of nurses and will visit one spot after another in this group of stricken street corners or residential or industrial areas. He will size up the situation, give morphine where needed, assign a nurse to watch and encourage persons who have not yet been liberated, and go on and do likewise at the second or third or fourth subdivision of the greater incident. They had not planned that at first, and they were pleased with the good effect this had on the morale of the wounded persons as well as of the workers to have a doctor there with his morphine as soon as they could dig in horizontally to reach the person they wanted to extricate maybe an hour or six hours or twelve hours later. That is the type of administrative development that they stressed for our consideration.

Of course all the medical men, like the other ARP workers, are in various categories, as to whether they are volunteers or paid service workers, and, if paid, whether on a full time salary or a part time salary. For the most part the medical men are paid either an annual salary or a retainer fee, or they are on a fee basis for the time that they spend doing blitz medical work.

#### THE AMBULANCE SERVICE

The ambulance service is the next step in the removal of casualties and a most important one. First they showed us that this was under the administrative control of a transportation or ambulance officer. By telephone he could call out a fleet of ambulances from an ambulance depot in the neighborhood if it was a small incident. If it was a greater incident the responsibility would rest on the chief transportation officer. Let us say for Greater London, when more than one area or borough needed aid the telephone would call on an adjacent administrative unit, and it would send in ambulance services or medical or first aid services to aid the more stricken area. This goes by the technical term of "mutual aid," which is nationwide in these services and is quite remarkable and helpful in all fields of civil defense.

Among the ambulances they have, first, the straight automobile for what they call the sitting cases, then the motor truck, which is reconditioned for 4 stretcher cases, 2 above and 2 below with a passageway between. They showed us in one borough a new device, developed locally, where the upper stretcher by a simple little metal release lock could be folded down against the wall so the lower stretcher could be used for sitting cases, if there were 2 stretcher cases and 2 sitting cases, by this simple little mechanism the 4 could be taken in the same car, which would be inconvenient otherwise. That device has since been approved by the Home Office and has been standardized and printed up and sent out for the use of the entire country.

The whole matter of stretchers is planned with extreme care in England, and one practically never sees more than one type of stretcher anywhere in that country. It is important to have metal holders with little legs on them, but they are identical all over the nation, which means that, if a big or little ambulance service drives up to a hospital and has 4 or 14 or 40 or 140 patients to evacuate, the patients aren't taken off the stretchers. The stretchers are deposited on horses, and there is a stack of identical stretchers over against the wall in a pile maybe 6 feet high, and 40 stretchers, or the equivalent number, are taken down and go out with the ambulances. That exchangeability is one of the things they stress as most important for the rapid handling of many wounded.

Next, for evacuating big city hospitals out to rural areas, the Green Line bus was used, reconditioned for ambulance use. The Green Line bus, translated into American language, is nothing more than a Greyhound bus, and they have large fleets of these. These are reconditioned for stretcher use, two tiers, upper and lower, so that after a bad blitz a central downtown hospital can send from 50 to 100 patients out to a rural evacuation hospital and have the beds available for the casualties of the next night. That was done during the winter of the 1940-1941 blitz all over England whenever there was necessity. That is the third item, the Green Line or Greyhound bus turned into an ambulance that could handle perhaps 20 or 30 casualties lying down.

Fourth, the ambulance or hospital train, which might have nine or ten coaches set up and reconditioned for ambulance service, and by this I mean what would in this country be similar to our open baggage car with stretchers on both sides in two tiers. These are always standing by on the railway siding in readiness in case of invasion or a severe blitz. They were used mostly when the army from Dunkerque was evacuated back from Dover and have been used only occasionally since that time.

A series of specific questions which Dr. Baehni wished answered by Prof. F. R. Fraser, who is the Director General of Emergency Medical Services in the Ministry of Health, are illuminating. Dr. Fraser in every regard has the same position in England that Dr. Baehni has in this country as Chief Medical Officer of the Office of Civilian Defense. He and Hodson and Sir Wilson Jameson, the Chief Medical Officer of the Ministry of Health, were most kind and patient in helping us get our information together.

Dr. Fraser said "It is essential that there should be elasticity in planning and rendering medical services in order to meet the actual blitz needs at any given time. The expected and the unexpected occur and create needs in entirely unpredictable proportions. The medical and dispensary squads are needed in the hospitals and probably should stay there during periods of blitz. The so-called incident doctors from the neighborhood of an incident are better to have on call to go to the place of a bombing. Mobile teams are not used very much." That means mobile surgical units in specially equipped motor trucks, but this opinion on their usefulness varies in different parts of the country and with the different feelings of the local medical chiefs in charge. "The hospital would do well to call for needed assistance to aid its own staff when overworked in an emergency. This is not done very much, for the following reasons: first, local hospital pride, second, the hospital medical staff is very busy and does not realize that it is being pushed, but it could do better work if it asked for help from another hospital at a distance where there was not a rush of cases at the moment, third, communications break down, the telephone may be blitzed out and the messenger services inadequate, fourth, the hospital called to render the assistance may be too busy to send it. The loan of medical and other teams from hospitals works well where you have an isolated incident or bombing, not so well if there are several incidents at the same time, which is quite usual.

"First aid party workers have a doctor and a nurse as a rule, and an auxiliary nursing force, or nurses' aides or stretcher bearers, with morphine and strychnine and surgical dressings. Each doctor is more or less in charge of his own equipment, and if he needs more than

he has he asks for aid by telephone from the control center, which will send a mobile unit if requested."

Another matter was stressed not only by Professor Fraser but by many other workers, and it is a point of great difference of opinion both in England and in this country. I was repeatedly told that the latest experience indicates the wisdom of trying to do as little first aid work at the incident or in the field as possible but to get the patient to a hospital unless the trouble seems to be trivial, in which case the first aid post or casualty station in the neighborhood can do the work.

No heat and a minimum of light was used at the first aid posts or at an incident. There is a great dread of any light, for fear of attracting more bombs from above. The mobile unit, however, and the ambulance unit would have a hot water bottle and a primus stove for warmth, filling hot water bags and making hot tea. The latter is of the utmost help in resuscitation and assisting morale, and for the British ranks alongside the cigaret.

"The rescue party, that is the digging party, which is a group that hand picks the masonry and debris off the victims with or without mechanical aid, has as its first job to get out the trapped casualties and to make the casualties accessible to the stretcher parties, but to know first aid is essential for them as well as for the first aid parties themselves. The rescue party man, while he generally is lifting off the debris, must also be able to give first aid and must know how to do so in order to guard against his hurting the casualty.

"Tetanus serum is never given at the incident or bombing but is always given whenever the skin is broken, either at a first aid post or at a hospital, and is recorded. You know of the kind of baggage tag or casualty card that is attached to each casualty. On that is recorded identification and other information and  $M\frac{1}{4}$  or  $M\frac{1}{2}$  to show the dosage of morphine given. This is also marked on the forehead of the victim so that a second dose will not be given." Professor Fraser recommended a half grain of morphine as a minimum dose for blitz casualties. He said we should give plenty, although he said probably a quarter grain is given as routine in the field in most English ARP work.

The best way to black out a first aid station, he said, is to brick up each window and bond the brickwork into the wall, that is by using steel, if one can. Electric light is used indoors day and night. The door coming out must be a light lock which will show no light from the outside. A brick baffle wall  $13\frac{1}{2}$  inches thick is used.

#### HOSPITAL ADMINISTRATIVE SERVICES

The British have evolved a regional hospital administrative setup for the entire nation which they hope to carry over into the peacetime future. In London there are nine medical schools, and the teaching hospital for the medical school is the central sector hospital for an area extending about 50 miles out into the rural country on a pie shaped sector basis, some broad and some narrow. All the hospitals in a given sector are commanded by the hospital chief at the sector or apex hospital in London. Every day he gets telephone messages of how many beds are available in each of the twenty or thirty hospitals in his sector. Picture this during ninety consecutive nights of blitz, as they had during that terrible winter. He picks up his telephone and he says to a hospital here or there "I am sending you a hundred patients." There are no questions raised as to who will pay the bill or "We will take it up with the board of trustees" or "This is a private hospital." "We will call you back in a half hour" or "We have

got the beds." This is blitz war medical administration and it works to perfection. I am sure you know that they planned for many more casualties than actually developed.

I would share with you a few of the things reported to me by Sir Girdling Ball who is the sector chief for the hospitals in sector III, radiating from St Bartholomew's in London. St Bart's as it is known, has about five hundred nurses, either registered or student. Peacetime nurses were sent out as a rule to the sector peripheral hospitals. Oddly enough they call a base hospital something that is out of the city, we might call it an evacuation hospital.

The peacetime nurses were sent to these peripheral hospitals to the extent of about four hundred, which left just a little over one hundred at St Bart's. Even this was not enough for the peripheral hospitals. To meet the needs the Ministry of Health organized the Civilian Nursing Reserve and these have been added at St Bart's and elsewhere as needed. In other words, the nurses are aided by trained assistants and auxiliaries or volunteers. If the hospitals in the outlying areas are not large enough to take care of the patients evacuated to them they build one story cottage huts adjacent to the hospitals. This they call "upgrading" the hospital by adding one hundred or two hundred or five hundred more beds. It means anything up to doubling the size of the hospital by the building of "hatted annexes."

The sector out of St Bart's had about two thousand five hundred nurses, including student nurses and reserve personnel. About two thousand of them were peacetime hospital staff nurses, and the other five hundred came from the group that had been trained, just as we are training extra nurses now in America.

Sir Girdling was asked what were the main problems in hospital administration under the blitz, and these were his replies:

First, personnel. The great difficulty is staffing the base hospital, that means the outlying hospital, with medical, nursing and lay personnel, including cooks, orderlies, masseurs and other such workers. There is a shortage of physicians, of nurses, of workers, of every one and certainly hospital administration is not made any the easier by that.

Another problem, again under personnel, has to do with the billeting of nurses and others transferred out to the rural hospitals. The latter might be a mental hospital or a communicable disease hospital or a private hospital or a county or poor law or welfare hospital. In the country there is no housing available to care for the added personnel of the upgraded hospitals. These would need three hundred extra beds in the St Bart's sector, and south of the Thames River the situation is even worse. The first planning was to meet the needs of the patients expected, but the needs of the hospital personnel were not anticipated, so it was necessary actually to use ward beds for sleeping the professional and other hospital workers who were sent out to do the nursing and other extra work.

Second, equipment. There is great difficulty in securing adequate equipment such as operating tables, x-ray and laboratory supplies, and kitchen equipment for upgraded hospitals. In London in peacetime there were just over twenty-one thousand voluntary hospital beds, that means private hospital beds, not government hospital beds, and seventeen thousand London County Council beds, these are public beds. In general the national government pays practically all the blitz hospital costs.

Sir Girdling said "We greatly overestimated the number of casualties that we would have in London. Up to a figure of 30,000 casualties a day was forecast, when we actually had somewhere around 300." They overestimated by one hundred fold, but they never regretted it for a moment and they continually said that to have had the opposite situation occur would have been tragic, even criminal. I think we have a big lesson to learn in this country from that.

Then, transportation of patients. The manner of transporting the patients was not a great difficulty, but it was hard to secure the proper equipment in this matter. Lorries or trucks were needed, and there was a great need for more x-ray and pathology and surgical equipment, as well as beds and equipment for kitchens.

Each hospital in the sector retains its own autonomy, and this is true I believe in a general way throughout England. Each hospital has a medical officer, a lay superintendent and a matron, and each of these has a deputy. The hospitals in London channel through the London County Council to the Ministry of Health. In other parts of England the administrative channel is through a local and a regional hospital office.

Sir Girdling then discussed blitz hospital financing. He said that the Ministry of Health pays for the casualty beds used. The hospital pays for the civilian sick. The Ministry of Health pays for all transfer of patients from the central to the outlying hospitals. If there is a crowding from the blitz, the civilian patients are sent out of the hospital to their homes or are crowded to make room to meet the need. In order to avoid delays in meeting the expenses in the hospitals, the Ministry of Health authorizes the lay sector official to pay for personnel and equipment. It may be a matter of purchasing twelve pillows or hiring an extra cook. Each quarter or semiannually an expense account is sent to the Ministry of Health for repayment. In other words, the hospital goes ahead and pays the bills out of its own pocket, knowing that it will be repaid by the central government.

We paid a visit to a part of St Bart's and to some of the other hospitals in sector III. Great emphasis was placed on the need for a one way ambulance route, incoming and outgoing, the swapping of stretchers, such as I have mentioned, and the careful keeping of records, which is not unusual in any hospital. Our host said the clerks who make the entry records when the blitz patients first come in to be admitted need to be tough, because these patients look mighty bad when they arrive and the clerk must be able to stand the sight of blood. I imagine he remembered instances in which the clerks had not been tough enough to take it.

At the receiving end of the hospital there must be a subdistributing office with wall charts and spot maps pins indicating the beds which are full and which are available, and what operating room facilities are available at the moment. This brought up the question of the operating room being underground and protected, in that technical sense that I mentioned, where you could go on operating if the rest of the hospital was blitzed away. In Liverpool I saw such a hospital, a thousand bed hospital, where there remained hardly anything that was less flat than this table top. All this happened one night in May 1940, when the city was heavily hit and the hospital was made just a shambles.

Often the operating room must be on an improvised basis because the main one, or the *protected one even*, may have gone. Then there must be a provision for transferring the patients upstairs by elevator if that is

*Care in the Delivery Room*—Immediately after delivery the baby is placed in the Trendelenburg position in a warmed premature infant jacket and covered with warmed blankets. After the pharynx has been cleared of mucus by gentle suction with an ear bulb syringe, 100 per cent oxygen inhalations are started. Although the intratracheal catheter is rarely necessary, it is kept ready for immediate use. Because of their potential danger, respiratory stimulants such as caffeine, nikethamide or metiazol are seldom used but are available if needed. As a last resort in establishing respiratory action they may be used in doses which we feel should be no larger than 1 to 2 minims (0.06 to 0.12 cc).

Silver nitrate is instilled into the eyes, but no attempt is made to replace the clamp on the cord with a tie and dressing. The baby is transferred to the nursery in its incubator or crib to minimize handling.

*Bathing, Weighing and Diaper Care*—It is of utmost importance that the child be handled as little as possible. Weighing and bathing are postponed until these procedures will not jeopardize the life of the baby. In some instances this has been as long as three or four weeks after delivery. The baby may be removed from the incubator or crib only after it appears able to maintain its body temperature. Whenever the infant is moved it should be well wrapped in blankets as a precaution against loss of heat.

After the initial weighing and oil bath, both of which have been delayed until the baby is in good condition, the premature infant is bathed and weighed only on written order. Until a weight of 1,800 Gm is reached, bathing and weighing at weekly intervals are usually sufficient. This interval is gradually decreased, until the baby is weighed and bathed daily when it has reached a weight of about 2,500 Gm. All baths are given with oil until the weight is 2,500 Gm, when soap and water may be used.

A diaper is placed under the buttocks inside the premature jacket on admittance to the nursery, but no effort is made to pin it. The diapers are changed and the buttocks and perineum oiled after each feeding. During this procedure gentle handling is imperative.

*Incubator Care*—The final criterion for the proper control of incubator heat is the temperature of the baby. Axillary temperatures are taken every one to two hours until the infant's thermal regulating mechanism is stabilized, and thereafter the temperature is taken every six hours. Regardless of the reading of the incubator thermometer, the indication for the increase or decrease of external heat rests exclusively with the baby's reaction. As an aid in conserving body heat, all premature infants are kept in premature jackets even while in the incubator. The incubator humidity is usually maintained at 50 to 60 per cent, but again these limitations may be altered to aid in controlling the temperature of the individual baby.

*Oxygen*—An infant whose estimated weight is less than 1,800 Gm is placed in a tent or closed incubator into which 100 per cent oxygen is administered at a rate of from 2 to 4 liters per minute. This procedure is followed regardless of the presence or absence of cyanosis, its principal purpose being to reduce the respiratory effort and to conserve energy. Many of the larger premature babies also are placed in oxygen tents until the respiratory mechanism has demonstrated its ability to function normally.

Inhalations of a mixture of 5 per cent carbon dioxide and 95 per cent oxygen are used at frequent intervals during the first few days of life to stimulate respiration and to aid in expanding the lungs. The administration of this mixture is of particular value before and after feedings. In giving such inhalations the mask is held at least 1 to 2 inches from the face, and the infant is allowed to breathe the gas for a period of about one minute.

*Feeding*—While few premature infants have starved to death, many have died as a result of aspiration of the formula. Feedings are withheld for twelve to twenty-four hours after birth, or until the swallowing reflex is present and the infant is strong enough to expend the energy required for eating. During the first day of feeding only 5 per cent dextrose is given to assist in washing swallowed mucus through the stomach and to supply fluid, thereafter breast milk is given if available, or a dilute evaporated milk formula may be used. The initial feedings may be as little as  $\frac{1}{8}$  ounce (3 cc) and are given at one to two hour intervals, depending on the size and strength of the baby. The amount offered and the time interval between feedings both are increased as the infant grows stronger and is able to take more food. Each baby is fed in its crib in a semi-Fowler position and is removed for feeding only after a weight of approximately 2,200 Gm has been attained. After each feeding the baby is "bubbled" by raising its head and gently patting its back without removing it from its crib. The position is then changed and the head is turned to one side to prevent aspiration in case the food is regurgitated. Crib feedings are continued until the infant becomes accustomed to the handling necessitated by daily bathing and weighing.

The small initial feedings may be given from an eye dropper, the tip of which is covered with soft rubber tubing. As the sucking reflex develops and strength is gained, the infant may be graduated to a Breck feeder and finally to a nursing bottle with a small nipple. If during a feeding any sign of respiratory distress appears nothing more is offered at that time, and it is often wise to omit the next scheduled feeding.

Isotonic solution of three chlorides or isotonic solution of sodium chloride may be given subcutaneously to supplement the fluid taken in the formula. The amount that may be given at one time, however, may be limited by the lack of subcutaneous fat in the premature infant, and all parenteral administration of fluids should be made with care because resistance to infection is relatively low. In general, subcutaneous administration of fluids is preferred to gavage feedings because of the dangers associated with the latter procedure, especially when it is carried out by inexperienced persons.

With the exception of vitamin K, which is usually given during the first two to three days of life, no other supplementary feedings are added until about eight to ten days after birth. At this time vitamin B, usually in the form of an elixir of thiamine or concentrated whole yeast extract, may be started. One drop is added to the formula and increased by 1 drop daily until 8 drops are being given. Iron, in the form of iron and ammonium citrates, is added in the same manner after the baby has become accustomed to the vitamin B. A total of 10 drops of the iron solution is used daily until diarrhea develops, in which case the dose is reduced. A concentrated vitamin D preparation is added next and is increased 1 drop daily until the therapeutic dose is reached. Ascorbic acid, usually in the form of d h . . .

orange juice, is the fourth addition to the supplementary medications and usually is incorporated in the feeding program by the time the baby is 1 month old.

Protein milk may be added to the formula after two to three weeks to increase the caloric and protein contents without increasing the bulk, and lactic acid is often added to the evaporated milk formulas in a concentration of 3 to 5 drops per ounce of milk. An attempt is made to maintain the caloric intake at about 75 to 100 calories per pound of body weight.

**General Procedures.**—Every precaution is observed to protect the infant from infection. Separate gowns and masks are worn when caring for the baby, and no one with an infection of any type is allowed to come in contact with it. The infant is shown only to its parents, and then only when its condition is such that it can be taken to the window in its crib. Until it weighs 2,500 Gm it is shown no oftener than once weekly. Premature babies are discharged when the weight is between 2,500 and 3,000 Gm, depending on home conditions and the baby's general health.

#### SUMMARY

A program of premature baby nursing care applicable to any newborn infant nursery has resulted in the University of Michigan Maternity Hospital in a 23 per cent increase in survival rate of all premature babies born alive during the past five years. The survival rate during this period was 90.5 per cent for all viable infants whose weight was between 1,000 and 2,499 Gm. This figure, as well as the corrected survival rate of 95 per cent for those premature infants who lived longer than twenty-four hours, justifies continuation and improvement of this regimen.

## THE INCIDENCE OF ACUTE LEUKEMIA IN CHILDREN

JEAN V. COOKE, M.D.  
ST. LOUIS

It has long been recognized that the acute forms of leukemia are far more common in children than in adults and that younger children are more frequently affected than older ones. In the third decade acute leukemia occurs far less than in the second, and, after the age of 30 years, it is relatively rare as compared with earlier ages. In the acute forms of the disease as well as the chronic types seen in adults, males are more commonly affected than females, the figures showing from 60 to 79 per cent of males in various groups reported. There are no statistics available which warrant more than the foregoing general statements, since all reports have dealt with relatively small groups of 100 cases or less. The only series of sufficient size to allow an age incidence analysis was that reported by Ward,<sup>1</sup> who collected 729 cases of all varieties of leukemia, in 398 of which the condition was classed as acute. His figures have been widely cited as showing the age incidence. He gave no actual figures but expressed the age incidence in acute leukemia as a histogram curve of semi-decades, showing a peak at 0 to 5 years and a second lower peak at 16 to 20 years. His only statement about the source of the cases is that "the series includes cases described in many countries but the majority are British." It is likely that they may have been taken

largely from published literature. Since the age incidence in his report varies considerably from that to be reported in this paper, it may be mentioned that, as far as acute leukemia is concerned, there are several features in Ward's series which suggest the possibility that the cases were selected in such a manner as to misrepresent the true age incidence. For example, apparently only 163, or 41 per cent, of the 398 patients were under 15 years of age, which is quite unexpected in a disease notoriously much more common in childhood, while almost 40 per cent more patients in his series were between the ages of 16 and 25 than between the ages of 5 and 15, which would also be very unusual.

#### MATERIAL

In an analysis of 126 cases of acute leukemia in children observed in the St. Louis Children's Hospital, certain features in the incidence of the disease were observed which suggested a similar examination of a large series of cases. This report is based on the analysis of the age and sex incidence in 1,500 cases of acute leukemia in children admitted to thirty-three children's hospitals or pediatric services in the United States and Canada during a period of years. In some of the institutions the older diagnosis files were not always considered trustworthy as to accuracy of diagnosis or did not permit the easy tabulation of cases, so that the series reported includes only the admissions in a recent period of years and may appear smaller than is expected from some clinics. In every instance, however, the figures represent successive admissions for the disease over consecutive years and can, therefore, be considered as representative of an unselected group so far as age and sex incidence is concerned. All forms of acute leukemia were included. Most of them were called lymphatic, although some were classified as acute myeloblastic, acute monocytic or acute myelogenous. The few cases of chronic myelogenous leukemia were omitted. Four of the hospitals (furnishing 15 per cent of the total cases) did not admit children over the age of 12 or 13 years.

#### RESULTS

The data from thirty-three children's services are shown in detail in table 1, in which the location of the clinics is given together with the name of the physician who collaborated by collecting the data. These data have been condensed in table 2, in which the age and sex incidence is summarized. The following features are to be noted.

**SEX.**—Of the entire group of children, 59.3 per cent were males although there is a definite tendency in younger children to less disproportion in sex incidence than in the older ones. For example, in the first year of life more girls were found than boys and in the first five years, in which more than half of all cases occurred, the percentage of boys was only 55.8, while in the second semidecade the percentage of boys had increased to 62.5 and in the third to 65. There appears to be a definite rise in the proportion of males starting with the age of 6 years. While the fluctuation in percentage in yearly age groups is such as to make a somewhat irregular curve the differences between the larger groups of younger and older children and the progressive increase in proportion of boys with the disease appear of sufficient degree to be statistically significant. The explanation for this difference is at present obscure although one might speculate as to whether it is to be interpreted as a progressive decrease

From the Department of Pediatrics, Washington University School of Medicine, and the St. Louis Children's Hospital.

in susceptibility in girls or a gradual increase in susceptibility in boys. Also the possibility of some relation of sex hormones to the variation in incidence suggests itself but present knowledge of the distribution and effect of these substances before sexual maturity is vague.

*Fig. 1*—The yearly age incidence from table 2 has been plotted in a curve in chart 1. The regularity of this curve is rather striking. From a moderate elevation in the first two years it rises abruptly and shows the highest incidence in the third and fourth years, with a sharp decline in the next three years and a progressive fall throughout the latter half of childhood. It is of interest that 40 per cent of all cases were in the period from 3 to 5 years and that almost half (48 per cent) occurred in the period from 3 to 6 years. The slight lowering of the curve after the age of 12 may be related to the fact that a few of the clinics did not admit children in these later years of childhood.

## COMMENT

It is of some interest to examine the age incidence curve of acute leukemia for features on which some deductions with regard to the etiology or nature of the

Chart 1—Age incidence of acute leukemia in 1 500 cases

disease might be made. Two of the most widely held hypotheses concerning acute leukemia regard the disease as of (a) neoplastic or (b) infectious origin.

So far as a comparison with malignant neoplasms is concerned, Warthin<sup>2</sup> states that "malignant tumors are relatively rare before puberty, but there is a steady ascending line of occurrence from childhood onward to middle life, both sarcoma and carcinoma showing a parallelism of occurrence." No collection of cases of malignant tumor in children exists of sufficient size to give accurate information about age incidence. Of other neoplasms in children the most frequently observed are those of the nervous system and of the kidney, although neither of these can be considered common. The majority of the latter are of embryonic origin (Wilms's tumor) and consequently develop only in the early years of life. Brain tumors are less frequent in childhood than in adult life, but Cushing<sup>3</sup> observed 148 verified cases (excluding tuberculomas) in children under 15 years of age. Most of these were gliomas. A comparison of the age incidence of these with the cases of

acute leukemia (table 3) shows a wide discrepancy, since there are a progressive increase in incidence of brain tumors in older children and a progressive decrease in the incidence of acute leukemia. No statistical evidence is available to suggest a relationship in the incidence of acute leukemia to that of other neoplastic growths.

TABLE 2—Age and Sex Incidence in 1,500 Cases of Acute Leukemia in Children

| Age Years | Boys | Girls | Total Cases | Yearly Per Cent of All Cases | Per Cent of Males |
|-----------|------|-------|-------------|------------------------------|-------------------|
| 0 1       | 54   | 59    | 113         | 7.5                          | 47.8              |
| 1 2       | 63   | 46    | 113         | 7.5                          | 60.0              |
| 2 3       | 120  | 89    | 209         | 13.9                         | 57.4              |

| 9 10      | 53   | 23    | 76          | 5.0                          | 69.7              |
| 10 11     | 43   | 30    | 73          | 4.9                          | 59.0              |
| 11 12     |      |       |             | 29.4                         | 62.5              |
| 12 13     | 38   | 24    | 62          | 4.1                          | 61.3              |
| 13 14     | 39   | 18    | 57          | 3.8                          | 68.4              |
| 14 15     | 23   | 13    | 38          | 2.5                          | 65.8              |
| 15 16     | 25   | 11    | 36          | 2.4                          | 69.5              |
| 16 17     | 20   | 13    | 33          | 2.2                          | 60.6              |
| Totals    | 889  | 611   | 1 500       | 15.0                         | 65.0              |

The theories of the infectious origin of acute leukemia may be divided into two types. The first considers that the disease is due to a specific acute infectious agent as yet unidentified and is based chiefly on similarity of certain clinical manifestations in acute leukemia and acute infection, the chief symptoms common to the two being fever, prostration, asthenia and evident toxicity. The irregular occurrence of acute leukemia, its lack of communicability and the failure to identify any infectious agent have placed some doubt on its specific infectious origin. The second hypothesis assumes that the relation to acute infections is of a less specific character and that many types of infection may initiate the changes which result in acute leukemia. Since this complication is relatively unusual after infections, it is

TABLE 3—Comparison of Age Incidence of Acute Leukemia and Brain Tumors in Children

| Age Yr | Acute Leukemia |          | Brain Tumors (Cushing Series) |          |

necessary to assume that it occurs only in certain persons in whom a constitutional inferiority of the hemopoietic system makes it vulnerable to injury by infections and possibly by other types of trauma.

That antecedent acute infection is directly concerned with the development of acute leukemia in a considerable number of cases is supported by many observations. It is relatively common to obtain the history that immediately preceding the development of symptoms of acute leukemia the child suffered from some acute infectious

illness, from which he had apparently recovered  
Pierce,<sup>4</sup> for example, noted that this was true in 48.7  
per cent of her series of 41 cases. In 126 cases from  
the St. Louis Children's Hospital such a history was  
given in 56, or 44.4 per cent, although no special inquiry  
about preceding infection was made. These antecedent

\* An additional child had acute leukemia soon after scarlet fever  
immunization, with unusually severe febrile reaction after each injection.

acute infections varied, although most of them were of  
the respiratory tract. They were classified as shown in  
table 4. The relatively high incidence of such antecedent  
acute infections gives support to the view that they  
may play an important role in the development of  
acute leukemia.

In considering the relation of acute infections to the  
etiology of acute leukemia in children, additional infor-  
mation may be obtained from comparing the relative  
age incidence of the two conditions. By far the com-  
monest infections during childhood are those related  
to the respiratory tract. Although no statistics are  
available as to the age incidence of such infections, all  
pediatricians will agree with Brennemann,<sup>5</sup> who said  
"These [respiratory] infections have their greatest inci-  
dence and severity both as to the primary infections and  
the complications and sequelae in infancy and earliest  
childhood." In certain of the acute readily communi-  
cable childhood infections, however, morbidity figures  
as related to age incidence are available for comparison.  
In table 5 are given the age distribution of 7,379 cases  
of measles and 3,311 cases of diphtheria representing  
admissions to the Willard Parker Hospital during the  
five year period of 1919 to 1923, from the data reported

the department of health. These values are shown  
graphically in chart 2, in which will be noted the strik-  
ing similarity in the age distribution curve of acute  
leukemia and those of diphtheria and measles in the  
Willard Parker Hospital series, each showing a rapid  
rise after infancy and a high proportion of cases in  
the early years of life. The cases from the Willard  
Parker Hospital include those of the more serious forms  
of the disease, and many of them were complicated by  
secondary infection. It is believed that these hospital  
cases illustrate the tendency of younger children to  
suffer more severely from acute infections in increasing  
numbers and, therefore, that this age distribution may  
be of value for comparison with the age incidence of  
acute leukemia. The figures are not cited to illustrate  
the true age incidence of these communicable diseases,  
since it is well known that such infections tend to show  
a second striking increase in the early school years.  
This is well illustrated in the distribution of the larger  
series of cases of measles in Detroit, although here  
also is seen the rapid primary rise in early childhood.  
It appears reasonable to conclude that the age inci-  
dence curve of acute leukemia tends to follow closely

Chart 2—Age incidence curves of acute leukemia, diphtheria and measles

that of acute infections and that a rather high percentage  
of cases of acute leukemia develop shortly after an acute  
infection.

SUMMARY

An analysis of the sex and age incidence of 1,500  
cases of acute leukemia in children showed the following  
trends:

- 1 During childhood there is a gradual increase in  
the proportion of males over females who have acute  
leukemia, the predominance of boys being greater in  
later childhood than during infancy. In the first year  
of life more cases were observed in girls than in boys.
- 2 The age incidence follows a regular curve, which  
rises from a moderate elevation in the first two years  
of life to a peak of highest incidence in the third and  
fourth years, with a sharp decline in the next three years  
and a more gradual progressive fall throughout the  
latter half of childhood.

It is concluded that acute infections form one of  
the factors in the production of the disease and there-  
fore play an important part in its causation, since (1) the  
highest incidence in acute leukemia occurs in early  
childhood, (2) the type of its age incidence curve tends  
to follow the frequency of acute infections in childhood,  
and (3) some acute infection frequently precedes the  
development of acute leukemia.

HYPERTENSION DUE TO RENAL  
EMBOLISMARTHUR M. FISHBERG, M.D.  
NEW YORK

Since 1938 I<sup>1</sup> have observed 4 cases in which embolization of one or both renal arteries was followed by a pronounced rise in arterial pressure. Prinzmetal<sup>2</sup> has studied a similar case in detail. Since the 4 cases observed in the span of four years were detected without special search in the course of routine ward work it would appear that hypertension is more than a rare manifestation of renal embolism. For this reason, and because of the theoretical and practical connotations of the elevation of blood pressure occasioned by embolic plugging of a renal artery the cases seem worthy of publication.

CASE 1—T. H., a man aged 42, was admitted on Oct. 22, 1938. He had felt entirely well until three weeks before admission, when he suddenly had severe constricting substernal pain which radiated down the right arm. Accompanying the pain were extreme apprehension and moderate shortness of breath. He sweated profusely. The attack lasted about ten minutes and subsided spontaneously. He had similar seizures about every other day for two weeks. Most of the attacks occurred while he was walking but others came on while he was in bed. He was then free of symptoms until the morning of admission, when he was awakened from sleep by an attack similar to the others.

Physical examination on admission disclosed no abnormalities other than moist rales audible at the base of the left lung. The electrocardiogram showed changes indicative of anterior infarction of the heart. The diagnosis of myocardial infarction was later confirmed by a roentgen kymogram.

Apart from occasional substernal discomfort the patient felt well during his first days in the hospital. The rales at the base of the left lung disappeared. The temperature, pulse rate, urine and leukocyte count were normal. However, on November 2 the picture suddenly changed. The patient complained of malaise, the temperature rose to 101 F and the leukocyte

count increased to 13,000 per cubic millimeter. The temperature rose November 3 to 102 F and the next day to 103 F, with the heart rate up to 100 per minute. He complained of pain in the left costovertebral region and the left upper quadrant. There was exquisite tenderness and muscular rigidity in the left costovertebral region. In the urine which had previously contained only occasional white blood cells there appeared a considerable amount of protein, and the sediment contained a few red blood cells and granular casts. These conditions lasted for about a week. After this the temperature, pulse

and urine returned to normal and the pain and tenderness in the left costovertebral region disappeared. The blood pressure readings are shown in table 1.

Summary—In a patient with myocardial infarction there developed an infarct of the left kidney due doubtless to embolization of an intraventricular thrombus. The renal embolization was accompanied by a definite rise in the systolic and the diastolic arterial pressure. The blood pressure returned to its previous level *pari passu* with the disappearance of the symptoms of renal infarction.

TABLE 2—Blood Pressure in Case 2 After Renal Embolism

| Date | Blood Pressure |            |
|------|----------------|------------|
|      | Systolic       | Diastolic  |
| 3/16 | 118            | 60         |
| 3/17 | 120            | 70         |
| 3/18 | 142            | 90         |
| 4/1  | 170            | 100        |
| 4/2  | 148            | 90         |
| 4/3  | 156            | 95         |
| 4/5  | 170            | 100        |
| 4/6  | 175            | 100        |
| 4/7  | 165            | 98         |
| 4/8  | 178            | 88         |
| 4/8  | 150            | 88 (death) |

CASE 2—I. B., a woman aged 26, was admitted March 15, 1939, complaining of pain in the right loin of four days' duration. She had had rheumatic fever at the age of 4 years and had been hospitalized several times in the past eight years because of heart disease.

Four days before entering, when feeling unusually well, she suddenly suffered excruciating pain in the right loin. The pain radiated anteriorly and to the right groin and lasted unabated for about ten hours. A physician then summoned diagnosed embolism from the heart to the right kidney. Slight pain in the right groin persisted until admission and the patient vomited occasionally. For two days before entering the hospital she was febrile, with a temperature as high as 103.6 F. She did not observe bloody urine.

Physical examination disclosed mitral stenosis with auricular fibrillation. There was tenderness in the right upper quadrant and the right flank. In the right side of the abdomen, below and behind the slightly enlarged liver a tender rather poorly defined mass was felt which was thought to be the right kidney. The urine was of specific gravity 1.026 and had a 1 plus reaction for protein but no red cells were observed.

Intravenous urography on March 18 disclosed no abnormality in the left side of the urinary tract but the right upper part of the tract did not visualize. Cystoscopy was performed on March 23. Both ureters were catheterized the full distance. There was a prompt flow from the left side with a good concentration of indigo carmine in three minutes. Though there was no flow of urine on the right side a retrograde pyelogram showed no abnormality of the upper part of the urinary tract on this side.

Severe pulmonary engorgement and then bronchopneumonia gradually developed. Tachycardia was more pronounced, and the patient became edematous. The venous pressure rose to 19.5 cm. of water and the saccharin circulation time to twenty-five seconds. Because of the likelihood that the hypertension due to embolism of the left renal artery contributed to the cardiac strain Dr. George Bachr considered the possibility of performing a nephrectomy on the left side but decided that the patient's poor general condition precluded operation.

Of interest is the fact that red blood cells were only rare in the sediment on many examinations.

The patient did not suffer from renal excretory failure, two days before death the urea nitrogen content of the blood was 23 mg. per hundred cubic centimeters.

Necropsy was limited to the kidneys. It revealed embolic occlusion of the trunk of the right renal artery with massive, though not total, infarction of the right kidney.

Summary—In a woman with mitral stenosis embolic occlusion of the right main renal artery with massive infarction of the right kidney was followed by a rise in arterial pressure.

CASE 3—S B, a woman aged 45, was admitted April 22, 1940 to the orthopedic service of the Mount Sinai Hospital

Six weeks before admission the patient fell from a street car and sustained a fracture of the left femur. There was no head injury. May 1 auricular fibrillation was detected. Operative reduction was performed, with insertion of a pin through the condyles. After the operation bronchopneumonia developed. May 22 the patient had a tonic followed by a clonic convulsion, which were repeated. There were three subsequent convulsive episodes. Numerous retinal hemorrhages appeared. The composition and dynamics of the cerebrospinal fluid were normal. The neurologic and electroencephalographic examinations suggested lesions in the right temporal lobe and the left hemisphere. There was no renal insufficiency. The day before death the urea nitrogen content of the blood was 13 mg per hundred cubic centimeters.

Necropsy showed mitral stenosis with a large thrombus in the left auricle. The right renal artery was completely occluded by a massive embolus. The right kidney was extensively but not completely infarcted. There were multiple areas of softening in the brain apparently due to embolization and also embolic infarcts in the spleen.

Summary—A woman with mitral stenosis and auricular fibrillation was admitted to the hospital for treatment of a fracture of the femur. While she was under observation, the blood pressure rose and proteinuria appeared. Necropsy showed embolic occlusion of the right main renal artery with infarction of the right kidney.

CASE 4—F J, a woman aged 36, was first admitted to the gynecologic service of Dr I C Rubin Dec 15, 1941 for interruption of a seven week pregnancy. She had had rheumatic heart disease with mitral stenosis since childhood. In recent years there had been repeated bouts of heart failure. On admission she had auricular fibrillation with signs of failure of both the right and the left side of the heart. She was given radiation in a dose calculated to produce abortion and castration and then discharged.

She was readmitted Jan 10, 1942 because of vaginal bleeding and cramps in the lower part of the abdomen of eight hours' duration. With the onset of labor, dyspnea and orthopnea had been accentuated. There were physical signs of mitral stenosis and regurgitation with auricular fibrillation and evidences of pulmonic and systemic venous engorgement. The lower part of the abdomen was diffusely tender.

TABLE 3—Data on the Blood Pressure and Urine After Renal Embolism in Case 3

| Date | Blood Pressure |                  | Urine   |
|------|----------------|------------------|---|
|      | Systolic       | Diastolic        |   |
| 4/27 | 160            | 90               | No protein, normal microscopically  |
| 5/1  |                |                  |   |
| 5/20 |                |                  | No protein, normal microscopically  |
| 5/28 |                |                  | 4 plus reaction for protein, few red blood cells                                  |
| 5/29 | 210            | 90               | 3 plus reaction for protein, few red blood cells and hyaline casts                |
| 5/31 | 210            | 110              |   |
| 6/1  | 260            | 95               | 3 plus reaction for protein many red blood cells, many hyaline and granular casts |
| 6/2  | 190            | 100              |   |
| 6/2  | 120            | 60 (ante mortem) |   |

The patient's intake of fluid and of salt were restricted, and she was digitalized. Solution of posterior pituitary was administered. January 10 the uterus was curetted during anesthesia.

January 11 severe pain and tenderness in the left costovertebral region developed. The temperature rose to 103.2 F. The urinary output fell to 350 cc in twenty-four hours. On cystoscopy, both ureters were readily catheterized. The urinary flow and the excretion of dye were normal on the right side, but there was no flow from the left kidney. The urine from the right kidney contained a few casts and many red blood cells. The urea nitrogen content of the blood was 56 mg per hundred cubic centimeters. The next day the blood urea nitrogen had risen to 78 mg per hundred cubic centimeters.

Tenderness was now present in both costovertebral regions. After the patient had been completely anuric for twelve hours, cystoscopy was again performed, but neither ureter could be catheterized. A nephrostomy was done on the right side, inspection revealed extensive infarction of the right kidney. The patient died about five hours after the operation.

Necropsy revealed mitral stenosis with pronounced dilatation of the left auricle. The left auricular appendage was almost

TABLE 4—Data on Blood Pressure and Urine After Renal Embolism in Case 4

| Date  | Blood Pressure |                          | Urine  |

|       | Systolic       | Diastolic                |  |
| 12/15 | 178            | 70                       | Normal microscopically   |
| 1/10  | 162            | 86                       | 2 plus reaction for protein numerous clumped white blood cells, occasional red blood cells |
| 1/20  | 182            | 105                      | 4 plus reaction for protein numerous clumped white blood cells, occasional red blood cells |
| 1/21  | 182            | 90                       | 3 plus reaction for protein clumped white blood cells 4 to 6 red blood cells               |
| 1/22  | 175            | 100                      | 3 plus reaction for protein many white blood cells 4 to 5 red blood cells                  |
| 1/23  | 152            | 98                       | 2 plus reaction for protein numerous red blood cells                                       |
| 1/24  | 114            | 62 (shortly ante mortem) |  |

completely filled by a partially adherent thrombus. The middle branch of the right renal artery was totally blocked by an embolus. The right kidney was extensively infarcted. The left main renal artery was entirely obstructed by an embolism just before its branching. The left kidney was almost completely infarcted.

Summary—In a woman with mitral stenosis, emboli from the left auricular appendage produced occlusion of the left main renal artery with widespread infarction of both kidneys and consequent renal insufficiency and uremia. The renal embolization was accompanied by the development of hypertension.

COMMENT

The hypertension that may follow renal embolism offers further and direct clinical evidence that elevation of the blood pressure may result from an impediment to the flow of blood through one or both kidneys. It appears to present a particularly close analogue in man to the hypertension that Goldblatt<sup>3</sup> first produced in the dog by the application of his clamp to the renal artery and Page<sup>4</sup> duplicated by wrapping the kidney in cellophane or silk with resulting constricting perinephritis. The obstruction to the renal circulation produced by the embolus lodged in a large renal artery is more nearly akin to that of the Goldblatt clamp than that occurring in association with the other lesions of the kidney and its vessels which result in hypertension. There would seem little room for doubt that the same mechanism operates to elevate the blood pressure in the clinical case of renal embolism and in the dog with experimental obstruction to the renal blood flow. This conception accords with the finding of Prinzmetal and his associates<sup>2</sup> that perfusates from the infarcted kidney of a patient with hypertension due to renal embolism contained a pressor substance similar to that which they found in the totally ischemic kidneys of animals with clamped renal vessels.

Puzzling is the fact that while renal embolism produces hypertension in some patients, in others it does not, or at least not to an unequivocal degree.

dilemma is the same one that occurs in connection with all forms of unilateral renal disease that may produce hypertension. Thus, since the original publication of Butler,<sup>5</sup> it has been known that sometimes unilateral pyelonephritis results in hypertension, as proved beyond civil in some cases by the return of the blood pressure to normal after nephrectomy, but in the vast majority of instances of unilateral pyelonephritis hypertension does not result. The conditions still remain to be formulated which determine whether or not in man a unilateral impediment to renal blood flow elevates the blood pressure. Their formulation is of urgent practical importance because in many cases of hypertension associated with unilateral pyelonephritic or hydronephrotic renal disease, nephrectomy has not been followed by any improvement in the hypertension. Among the factors that may be concerned in deciding whether or not a unilateral impediment to renal blood flow produces hypertension are the following:

(a) *The ratio of the partially ischemic but still functioning renal parenchyma to the total mass of functioning kidney tissue.* Recent experimental work suggests that whether or not hypertension occurs in association with a unilateral renal lesion depends on the balance between the precursor pressor substance (renin) formed in the ischemic renal parenchyma and the ability of the intact kidney tissue either to neutralize this substance by the elaboration of an antipressor body or to destroy or excrete it. In accord with this view hypertension seems to result from renal embolism only when a large mass of the kidney is rendered ischemic.

(b) *The individual predisposition to hypertension.* Clinical and statistical investigations of recent years have demonstrated that in the large majority of instances so-called essential hypertension develops in persons of the sthenic constitutional habitus with an inherited familial predisposition to high blood pressure. At least a high proportion of these persons pass through a prehypertensive stage of many years' duration, during which the blood pressure is most of the time within normal limits but in which the liability to hypertension is demonstrated by an abnormally great response to the cold pressor test of Hines and Brown<sup>6</sup> or the precipitation of transitory hypertension by such emotional stimuli as an insurance examination. It would appear probable that the occurrence of unilateral renal disease in a person who has a hereditary predisposition to essential hypertension but who is still in the prehypertensive stage is especially apt to evoke a rise in blood pressure. I have seen a number of patients with hypertension following unilateral pyelonephritis or hydronephrosis who seemed to have this pathogenesis. Likewise, it seems probable that a large renal embolism would be especially likely to produce hypertension when affecting a person with a hereditary predisposition to essential hypertension. It should be remembered that this hereditary predisposition is extremely common, for almost one quarter of all deaths over the age of 50 are due to hypertensive disease.

(c) *The general condition of the patient.* This may militate against the development of hypertension. Especially important in this regard is the presence of fever. It has long been known that during fever established hypertension may fall. This drop in blood pressure

has been assumed to be due to widespread arteriolar dilatation. The recent investigation of Smith and Goldring and their colleagues<sup>7</sup> indicate that at least some pyrogens produce a remarkable increase in renal blood flow, and fever would therefore be expected to be especially potent in counteracting hypertension of renal origin. It may well be that the presence of fever explains the great rarity of hypertension following even massive renal emboli in subacute bacterial endocarditis. Another important factor in determining the occurrence of hypertension is doubtless the necessity for a functional capacity of the circulation adequate to maintain a high blood pressure. The terminal fall in blood pressure in cases 3 and 4 was doubtless due to the failure of the circulation.

Excretory insufficiency of the kidneys plays no part in the production of the hypertension due to renal embolism. Only in patient 4, the 1 patient in whom the embolism was bilateral, did significant azotemia develop. That renal embolism can produce hypertension without seriously impairing the excretory accomplishment of the kidney would be anticipated in the light of the observations on experimental hypertension, in which appropriate clamping of the renal arteries produces elevation of the blood pressure without evident impairment of excretion.

The appearance of hypertension may be of diagnostic help in the sometimes difficult differentiation of renal embolism from such conditions as splenic or pulmonary infarction or diaphragmatic pleurisy. But it should be remembered that unequivocal hypertension does not occur in association with all large renal emboli. A fact perhaps worthy of reiteration from the diagnostic point of view is that massive infarction of the kidney may be present even though the urine contains only rare red blood cells; it is presumably due to suppression of the function of the infarcted kidney.

#### SUMMARY

Hypertension may result from embolism of one or both main renal arteries.

#### ADDENDUM

CASE 5—May 13 1942 I saw with Dr M. F. Stemberg another patient in whom he had observed the development of hypertension due to renal embolism. This man had had a myocardial infarction several years previously. His blood pressure for two years had been less than 130 mm systolic and 70 mm diastolic. In December 1941 and March 15 1942 he had emboli to the right kidney without change in blood pressure. April 19 1942 he had an embolism to the left renal artery. Following this his blood pressure rose to 185/100 and has remained at about this level to the present writing (May 20 1942).

**Public Opinion**—Public health to keep down epidemics education for jobs, an acceptable dietary standard (enough bulk and variety to keep people healthy) are social objectives that are widely approved. Opposed are the colossal costs, the growing dependence of millions of people on public money, the sacrifice of initiative and resourcefulness, the continued breeding of the unfit too little checked by existing sterilization laws. Public opinion is required not on these things as separate items one by one but as related items. Public opinion is therefore hard to form. The relation of item to item rather than the items by themselves may be the critical part of the business. The worth of a man is also a part of it and how shall we determine worth?—Bowman Isaiah. *Enduring Purpose Assn. Int. Coll. Bull.* 26: 195 (May) 1940.

AN EVALUATION OF RHEUMATIC  
NODULES IN CHILDREN

A CLINICAL STUDY OF 167 CASES

ROWINE M HAYES, MD

AND

STANLEY GIBSON, MD

CHICAGO

Subcutaneous rheumatic nodules were first described by Wells<sup>1</sup> in 1812. In reporting a case of "rheumatism of the heart" he said:

Many of the tendons of the superficial muscles in this patient were studded with numerous small hard tumors, an appearance I have observed only in one other person, a thin and feeble man of 41 years who also labored under rheumatism.

In 1875 Meynet<sup>2</sup> gave a clear description of rheumatic nodules occurring in a boy of 14 years who was 1 with rheumatic heart disease. The first comprehensive report on rheumatic nodules was that of Barlow and Warner<sup>3</sup> in 1881. Their study comprised 27 patients with rheumatic nodules. They described the number, size, location and duration of the nodules. They emphasized the fact that of the 27 patients 26 had a definite mitral murmur and the remaining 1 had a "murmurish first sound." Eight patients died. This presentation of the place of subcutaneous nodules in the rheumatic syndrome remains a classic after sixty years. Later English writers continued to observe and record the occurrence of nodules in a fairly large percentage of cases of severe rheumatic fever. Observers in our own country failed to find rheumatic nodules with anything like the same frequency with which they were detected in England. Holt,<sup>4</sup> who was familiar with the work of Barlow and Warner, stated in the first edition of his textbook, published in 1897:

They are certainly not common in this country, notwithstanding that I have made it a rule to examine rheumatic patients for them, I have seen them but seldom, and they have been marked in only two or three cases. Thus, I think, has also been the experience of most observers in New York. From published reports, however, they appear to be much more frequent in England.

During the following twenty years the same opinion was voiced by other leading American pediatricians. In 1919 Brennemann<sup>5</sup> challenged this view. He said:

In the last five years since we have been especially interested in these nodules and have really looked for them we have become increasingly convinced that they occur in our cases quite as frequently as they do in an equal number of similar cases of rheumatism in England.

Not only did his paper serve to call attention to the frequency of nodules, but, by giving the most accurate clinical description of nodules which we have found anywhere, he taught other observers how to identify them. More recent studies in many clinics have established the fact that rheumatic nodules are frequently found wherever severe rheumatic fever occurs.

It is now generally conceded that subcutaneous nodules are pathognomonic of rheumatic fever, that they are usually associated with severe rheumatic heart disease and that the prognosis in instances in which they occur is always uncertain. In spite of the numerous observations which have served to establish the place of nodules in the rheumatic series, there are few detailed reports in a large number of cases as to their incidence, location, number, duration, relationship to other rheumatic phenomena and prognostic significance. The privilege of working in a large and active children's heart clinic, where hospital facilities are available for the seriously sick children, has given us the rather unique opportunity of making careful clinical studies on a large number of patients.

Our material comprised 167 children who exhibited rheumatic nodules. They were for the most part house patients at the Children's Memorial Hospital. Some were seen at St. Luke's Hospital, and a few were observed in the outpatient clinic at both institutions. All were observed within the past ten years, and all were seen personally by one of us.

Of the group of 167 patients, 86 were boys and 81 girls. This contrasts sharply with the sex incidence of our total group of patients with rheumatic fever and chorea, in which girls exceeded boys in a ratio of 1.35:1. Findlay,<sup>6</sup> in a series of 73 cases of rheumatic nodules, also found the proportion of boys to girls relatively high, being 1.13 in cases of rheumatic nodules, as compared with 1.18 in the entire rheumatic group.

The age incidence in our group showed a close parallelism to the age incidence for rheumatic infection in general. Ages at the time of onset of rheumatic nodules were: 2 years, 2 cases; 3 years, 4 cases; 4 years, 4 cases; 5 years, 17 cases; 6 years, 18 cases; 7 years, 20 cases; 8 years, 29 cases; 9 years, 29 cases; 10 years, 21 cases; 11 years, 12 cases; and 12 years, 11 cases.

Rheumatic nodules occur most noticeably over the bony prominences of the joints of the extremities, but they are by no means limited to these locations. In this series of cases we have seen them over the elbows, knees, scalp, knuckles, fingers, ankles, spine, toes, dorsum of the feet, wrists, scapula, sternum, ribs, clavicle and iliac crest and along the tendons of the muscles above the wrist and above the malleoli and of the hamstring muscles. There were, however, certain favorite locations. The most frequent site was the elbows, nodules occurring in this location in 117 of the 167 cases. They were present on the knees in 82 instances, on the scalp in 50, on the knuckles in 50, about the malleoli in 47 and on the vertebral spines in 46. When numerous nodules were present they were usually widely distributed, whereas when only a few nodules were present they were likely to be limited in their distribution. In 26 cases they were found only on the elbows, in 8 only on the spine, in 4 only on the occiput and in 2 only on the knees. In 1 instance each the location was the wrists, knuckles and ankles.

Barlow and Warner,<sup>3</sup> in their original article, called attention to the frequent symmetrical distribution of nodules on the extremities. This point has seldom been mentioned in the recent literature, though it is worthy of emphasis. Thus, if nodules appear on one elbow, they are usually seen on the opposite elbow, and often in an identical location. They may not appear at exactly the same time, but, when a nodule or a crop of nodules

This study was aided by the Harold A. Bachman Memorial Fund. From the Cardiac Service of the Children's Memorial Hospital and the Pediatric Heart Service of St. Luke's Hospital.

seen in a given location the opposite extremity should be carefully searched in the same region. Thus in 89 of our cases nodules were found in identical locations on the right and left extremities. They were for the most part symmetrical in 26 others.

The duration of nodules is difficult to determine accurately. In the first place the exact time of appearance is uncertain unless the patient is inspected every day. Even if this is done there is often uncertainty as to whether a slight elevation which one observes is actually a nodule until it has been watched for several days. We have however seen sizable nodules which have apparently appeared overnight. The exact time of disappearance is as uncertain as the onset. Moreover in the presence of several nodules in close proximity the fate of the individual nodule is not easy to follow. We can only say that some nodules have disappeared within a few days whereas others have persisted for months. The duration of crops of nodules as opposed to the individual nodule may be much longer. We had 1 case in which nodules were exhibited continuously over a two year period and several in which they persisted for more than a year.

The number of nodules in the individual case varied widely. In many instances, particularly in our earlier cases, the exact number was not stated, the number being designated as few or many. In 67 cases the number was recorded and ranged from a single nodule to 108 nodules. In 15 cases 20 or more were present at one time and in 7 of these there were more than 50.

Eighteen patients had one or more recurrences of rheumatic nodules. We were interested to ascertain whether the nodules followed a pattern similar to that of the original attack. We found no such relationship. In location, number and duration the nodules showed considerable variation from those in the first attack.

The relationship of rheumatic nodules to other rheumatic phenomena lends to them their chief importance. It is significant that in every 1 of the 167 cases other evidence of rheumatic fever was present. Chorea occurred in 18 cases, and joint pains in 144 cases during the period in which nodules were present. Definite signs of heart disease were found in 163 cases, or in all save 4 of the entire group. This is the outstanding fact in connection with rheumatic nodules. It is generally taught that heart disease is invariably present when nodules are discovered. This may be true, though we were unable to demonstrate its presence in 4 of our cases. Of the 163 cases of definite cardiac involvement, mitral damage was found in all. Aortic insufficiency was observed in 38 instances. A pericardial friction rub was encountered in 30. Both by physical and by roentgenographic examination, cardiac enlargement was detected in practically all cases, and in the majority it was well defined. In short, the physical and roentgenologic findings indicated in most cases a severe degree of cardiac damage.

Because of the severity of the cardiac lesions in the presence of rheumatic nodules, it is obvious that these nodules imply a serious prognosis. In this group of 167 patients 52 are known to be dead, a mortality of 31 per cent. It is interesting to recall at this point the mortality in Barlow and Warner's<sup>3</sup> series of cases published in 1881. Of their group of 27 patients, 8 died, a mortality of practically 30 per cent. Doubtless the close approximation of the mortality percentages in the two groups of patients is largely accidental, yet we could not but be struck by the fact that these patients studied in England sixty years ago were apparently closely

comparable to our own in the seriousness of their cardiac lesions. The mortality rate of our patients with nodules was practically twice that of our entire series of patients with rheumatic heart disease. Forty-eight died of congestive heart failure, 2 died of bacterial endocarditis and 2 died suddenly without signs of advanced heart failure. Nodules were present at the time of death in 43 instances.

It has often been stated that the number of nodules is significant in prognosis, the greater the number the more serious the outlook. We have not found this to be true. The number of nodules averaged no higher in those who succumbed than in those who survived. As a matter of fact the 2 children who had the greatest number of nodules, 105 and 108, made excellent recoveries from their active infection and are getting along comfortably at the time of writing.

From the practical standpoint, nodules may be said to occur in a fairly characteristic clinical setting. They usually arise days or weeks after the onset of a rheumatic episode in which protracted infection is present, in which there is evidence of cardiac damage, usually severe in type, as shown by signs of valvular damage, cardiac enlargement and often pericarditis. Low grade fever is the rule, though the temperature may be normal for weeks at a time. The patient is pale and waxy in appearance. He seems fatigued, the appetite is poor, and signs of congestive heart failure are frequently present. The course may continue relentlessly downhill to a fatal termination. When recovery occurs, improvement is slow and many months usually elapse before convalescence is established. The disappearance of nodules does not necessarily indicate the cessation of active infection. Their continued presence, particularly when new nodules are appearing from time to time, is good evidence that the rheumatic process is active. We have encountered a few patients who showed all the signs of convalescence, including a normal sedimentation rate, before the complete disappearance of the nodules.

In a consideration of rheumatic nodules in relation to prognosis, something should be said on the negative side. Though the presence of nodules usually signifies severe rheumatic infection, the absence of nodules does not necessarily imply a mild type of infection. Indeed, in the case of the acute fulminating type, in which death occurs within a few weeks of the onset, nodules are likely to be absent. It is in the severely infected child whose illness is protracted that the rheumatic nodule is prone to appear.

#### SUMMARY

- 1 Of 167 children with rheumatic nodules, 86 were boys and 81 were girls.
- 2 The age incidence of patients with nodules closely paralleled the age incidence in the group with rheumatic infection in general.
- 3 Nodules were found in many regions the most frequent locations being the elbows, knees, scalp, knuckles, malleoli and vertebral spines.
- 4 Nodules on the extremities tended to be symmetrical in their distribution.
- 5 The duration of nodules varied from a few days to several months.
- 6 Other rheumatic phenomena were present in every case.
- 7 Rheumatic heart disease was found in 163 cases.
- 8 Fifty-two patients (31 per cent) died.
- 9 The number of nodules in the individual case was not found to be important in determining the prognosis.

## DEATH FROM ASTHMA

## A WARNING

WARREN T. VAUGHAN, M.D.

AND

W. RANDOLPH GRAHAM, M.D.

RICHMOND, VA

Miss V. S., aged 17, seen in September 1940, had asthma of thirteen years' duration. It was perennial and was present every day but was worse in winter. She had had many years of treatment. As is usual with this type of asthma, the etiologic factors were multiple, the basic condition being intrinsic, associated with long standing sinus infection but exaggerated by extrinsic factors such as sensitization to house dust and feather dust.

Miss S. was hyposthenic and undernourished. The therapeutic program consisted in improvement of her general condition and increasing the allergic tolerance with injections of the appropriate extrinsic allergens and an autogenous vaccine. Treatment covered the interval from September 1940 until her death in 1942. During this time her condition was about 50 per cent improved. She was usually quite free in the daytime, having mild attacks each night frequently requiring one injection of epinephrine and with some exacerbation during the catamenia. In fact she improved to such a degree that she married in May 1941. She had three severe attacks of several days' duration occurring in February, August and November 1941 and accompanying acute respiratory infections. During these attacks she required epinephrine hourly or more often and at times became refractory to it. Fortunately, when she became epinephrine fast she responded to intravenous aminophylline.

On Feb. 16, 1942 she was having a fourth severe attack in which epinephrine was no longer effective, but she was still well enough to come to the office, requesting an injection of aminophylline. This relieved her temporarily, but the following day asthma again became severe. The family physician was called. An injection of morphine was given. Her respiration fell to 4 a minute and she died within a short time.

There is no doubt that this patient was suffering from very severe asthma, but she had had three attacks equally severe or nearly so during the period of observation from which she had recovered.

The danger of opiates in intractable asthma and status asthmaticus is widely recognized among allergists, who have attempted to disseminate this information in their writings. For several years every consultation report concerning an asthmatic patient, sent from our office, has contained a cautionary paragraph concerning the dangers of morphine. The number of asthmatic patients reporting for allergic study who state that morphine has been given them for acute attacks indicates the need for special emphasis on this subject.

Death from acute intractable asthma is quite rare. We have observed 8 such deaths among the several thousand asthmatic patients whom we have examined in the last twenty years.

CASE 1—A woman in her fifties had severe asthma (not status asthmaticus) and valvular heart disease with decompensation. Death was due to the combination of circulatory and respiratory factors and was not associated with the administration of opiates.

CASE 2—A woman after several quiescent months had a severe acute attack of asthma. She died within an hour after the second dose of  $\frac{1}{6}$  grain (0.01 Gm.) of morphine given her by her husband. She had been acutely ill less than twenty-four hours.

CASE 3—This patient had had intractable asthma for two years. Receiving no great benefit from allergic therapy, she consulted another physician, who gave her digitalis, presumably on the theory that after such long-continued asthma there must be some resultant heart strain. There was no decompensation. At autopsy the heart was found to be smaller than normal, "contracted into a small mass," according to the report of the pathologist.

A dilated heart delivers reduced minute volume of blood into the vessels. Digitalis increases muscle tone, and as the heart approaches normal the minute volume increases, resulting in greater circulatory efficiency. But digitalis given to a normal size heart further contracts it, resulting again in diminished output, thus further impairing oxygen delivery to the tissues. This is particularly harmful to an asthmatic patient who is already anoxic.

CASE 4—A man aged 23, suffering from severe recurrent asthma and generalized dermatitis, had improved under allergic and dermatologic therapy and was sojourning in Florida when a severe acute asthmatic attack developed. The local physician gave him  $\frac{1}{6}$  grain (0.004 Gm.) of dilaudid hydrochloride. The report concerning his death four hours later stated that "after the injection he went to sleep and slept until some one realized that he wasn't breathing any more."

CASE 5—A married woman aged 26 had had incessant attacks of asthma for five years. She had had a long period of treatment in the Johns Hopkins Protein Clinic, then by a competent allergist in Washington, D. C., followed by five months of treatment by us. The cause of death was unknown, but from the nature of the symptoms and the fact that she had been most despondent suicide was suspected. Autopsy could not be obtained.

CASE 6—The patient had typical severe status asthmaticus which was not responsive to epinephrine, aminophylline, oxygen or avertin with amylene hydrate. The hospital intern had given her two injections of morphine,  $\frac{1}{4}$  grain each (0.016 Gm.) the day before her death. We feel that the interval is rather long to implicate morphine, but morphine certainly did not help her, and her condition steadily grew worse. Permission for autopsy was not granted.

CASE 7—An elderly woman in status asthmaticus had failed to respond to the customary measures of treatment. We first saw her but a short time before her death. Arrangements were quickly made for bronchoscopy in the hope that a plug of mucus might be found, but the patient died in the operating room before bronchoscopy could be started.

This is of interest because when there are obstructing plugs causing status asthmaticus bronchoscopy may be life saving. Not long before, bronchoscopic treatment of a patient with a similar condition, apparently moribund, had resulted in prompt recovery. The patient's asthma was then treated allergically and she has remained nearly free during the intervening four years. The latter case helps to answer the question which might have been raised had bronchoscopy actually been started in case 7, as to whether the manipulation might have caused death.

The eighth case is the one described in the opening paragraphs.

## COMMENT

The administration of opiates for severe asthma is definitely contraindicated on two counts. First, to the person fighting for his breath and trying to get enough air to prevent anoxia, a drug which depresses the central nervous system, including the respiratory

center increases the difficulty. Second, morphine is a parasympathomimetic drug, exerting a slight but definite bronchospastic effect. This is precisely what one is trying to avoid in the treatment of asthma. We recognize that many asthmatic patients receive injections of opiates without serious consequences but would emphasize that the sicker the patient is, the greater is the risk.

Opiates should be rigorously avoided in the treatment of severe asthma and especially so when other drugs, such as the ephedrine derivatives, epinephrine and aminophylline are far superior. Even when these fail, morphine and its derivatives should not be used.

Supplementary drugs such as digitalis should not be employed unless the need for them has been clearly established.

Bronchoscopy may occasionally be life saving.

## Clinical Notes, Suggestions and New Instruments

### SEVERE ANGIOEUROTIC EDEMA FOLLOWING DIETHYLSTILBESTROL THERAPY

WILLIAM SAPHIR, M.D. AND A. R. WEINGLASS, M.D.  
CHICAGO

Ever since its recent release by the Food and Drug Administration diethylstilbestrol has enjoyed wide popularity among physicians as well as the public. Its real value has been attested by numerous clinical and experimental studies.<sup>1</sup> In view of the fact that toxic manifestations have already been reported,<sup>2</sup> a word of caution seems in order.

Toxic reactions reported were nausea, vomiting, abdominal distention and cramps after meals, anorexia, diarrhea, vertigo and paresthesias. Other toxic manifestations observed were cutaneous rashes such as diffuse brawny erythema and pruritic papular and macular eruptions.

In this paper we present a hitherto unreported toxic reaction to diethylstilbestrol, namely a severe and alarming form of angioneurotic edema.

#### REPORT OF CASE

Mrs. A. H., aged 53, appeared at the office of one of us (W. S.) on Nov. 21, 1941 with complaints of hot flushes, nervousness, palpitation and insomnia. The symptoms dated back three years, when she had stopped menstruating but recently they have increased in intensity. The past history was insignificant, and in particular there was no history of previous allergic manifestations such as hay fever, asthma or urticaria. Physical examination was entirely negative except for a moderately elevated arterial blood pressure of 160 systolic and 95 diastolic and a slightly accentuated aortic second sound. The heart was not enlarged, the action was regular and rhythmic and no murmurs were heard. Counts of the white and red blood corpuscles and urinalysis were normal.

A diagnosis of menopausal syndrome was made, and diethylstilbestrol was prescribed 0.5 mg. to be taken nightly at bedtime. No other prescription was given.

Six days later the patient returned to the office and stated that she felt much better in general but that for the past twenty-four hours she had noted a painless swelling of the right wrist. Examination revealed pitting edema of the

right dorsum manus. Because of the possibility of a traumatic accident a roentgenogram was taken and showed no evidence of a pathologic condition. Conservative measures were recommended and the patient continued with diethylstilbestrol medication.

The next day the patient reported by telephone that the swelling of the right hand had subsided considerably but that a similar painless edema had suddenly appeared on the left dorsum pedis. Although the possibility of an allergic edema was then considered the situation was not deemed serious enough to warrant immediate attention, and the patient was advised to appear at the office the next morning.

The same night, however, one of us (W. S.) was frantically summoned to the patient's home. The picture then indeed seemed alarming. The patient had retired without any discomfort, she suddenly awakened at 2 a.m. in great distress. There was extensive edema and eversion of both the upper and the lower lip. The edema extended well into the submaxillary and lateral cervical regions. The mouth could be opened only with great difficulty, and the tongue appeared swollen and enlarged. There was considerable cyanosis of the face and a slight laryngeal stridor was audible.

In view of the possibility of an impending edema of the glottis, the patient was immediately hospitalized. Calcium gluconate 15 grains (1 Gm.) was administered intravenously, repeated after two hours and again after six hours. Epinephrine was not given because the blood pressure had risen to 200 systolic and 100 diastolic, but ephedrine  $\frac{1}{8}$  grain (0.024 Gm.) was given at four hour intervals, as soon as the patient was able to swallow.

The alarming picture subsided rapidly, and the patient made an uneventful recovery. After twenty-four hours the edema had subsided, with the exception of some swelling of the lower lip and the submaxillary region, where it persisted for several days longer.

In order to ascertain, if possible, the etiologic relationship between the angioneurotic edema and diethylstilbestrol medication the following cutaneous tests were performed:

1. Patch tests over the sternum with diethylstilbestrol in 0.85 per cent saline solution were negative after forty-eight hours, as well as the controls (of plain saline solution).

2. Scratch tests of the same solution on the left forearm produced a faint redness and slight edema after thirty minutes, whereas the saline controls remained unaffected.

3. Intradermal tests on the right forearm of 0.1 cc. of a diethylstilbestrol solution of 1:10,000 in 0.85 per cent saline solution produced a definite redness and nodulation measuring 1 cm. in diameter at the height of the reaction at forty-eight hours. Intradermal tests over the right forearm of 0.1 cc. of diethylstilbestrol solution of 1:2,000 in 0.85 per cent saline solution produced a strong reaction with considerable pain, edema, nodulation, pseudopod formation and erythema measuring 3 cm. in diameter at the height of the reaction at from eight to twenty-four hours. The reaction gradually disappeared during the next two days.

#### SUMMARY AND CONCLUSIONS

Available evidence indicates that diethylstilbestrol, an effective synthetic estrogen, is being widely used, perhaps partly because of the publicity given this drug in the lay press. Toxic reactions have already been described. The present report deals with a severe angioneurotic edema of the face and neck which appeared after a six day course of 0.5 mg. of diethylstilbestrol daily. Danger of edema of the glottis necessitated hospitalization.

The etiologic relationship between diethylstilbestrol medication and the angioneurotic edema is believed confirmed because of a strongly positive cutaneous reaction to diethylstilbestrol, because of the absence of other possible allergic factors in a hitherto nonallergic person and finally, because of the complete disappearance of symptoms following cessation of diethylstilbestrol.

On admission the temperature was 102.6 F, the pulse rate 100, the respiratory rate 36 and the blood pressure 110 systolic and 60 diastolic Physical examination revealed that the patient was well developed and obese, she was pale and appeared acutely ill Respirations were shallow and rapid, with slight wheezing Numerous purpuric spots were noted over the

entire body There was a slight icteric tint to the skin The conjunctivas and scleras were pale and slightly icteric No petechiae were noted No aural discharge or tenderness was present There was no nasal bleeding The mouth was edentulous Ulceration of the gums was not present The pharynx was not inflamed The neck revealed no adenopathy and no venous distention Examination of the lungs showed poor expansion bilaterally There was no change in percussion There were numerous fine crepitant inspiratory rales and coarse expiratory wheezes throughout both lungs There was no detectable enlargement of the heart The rhythm was regular and no murmurs were heard The abdomen was obese and distended Moderate tenderness was noted throughout There was bilateral tenderness of the costovertebral angle, more severe on the right than on the left Neurologic examination was negative

The results of laboratory investigations are listed in the accompanying tables

The temperature ranged between 102 and 103 F, slowly dropping to 98 F on the fifth to the sixth day of hospitalization Clinically the patient appeared to improve until the seventh day of her hospital stay (October 18) At that time the temperature rose and she became disoriented There were a few inspiratory rales at the base of the right lung The abdomen was distended but not tender There were red areas on the buttock which

| 1      | 1.0  | 2.7          |           |                   |                  |               |
| 1      |      |              |           |                   |                  | Too low       |
| 17     | 8    | 0.4          |           |                   |                  |               |
| 20     | 40   | 0            | 4.0       | 15.5              |                  |               |
| 22     | 13   | 1            |           |                   |                  |               |
| 23     | 71   | 1.5          |           |                   |                  |               |
| 24     | 65   | 1.7          | 540       |                   |                  |               |

It is important to note that the aplastic picture was evident after the administration of only 1 Gm of sulfathiazole every four hours for two days a total of 12 Gm. The immediate improvement on cessation of the drug with return of the bone marrow picture to normal indicates that the process is not an irreversible one if discovered early. It is also significant that there was no relapse to the aplastic state even though the patient subsequently died with evidence of sepsis.

#### THE INTRAPERITONEAL USE OF SULFATHIAZOLE WITH SPECIAL REFERENCE TO THE PRO- DUCTION OF ADHESIONS

REPORT OF A CASE WITH SECONDARY INTESTINAL OBSTRUCTION

HENRY B. SUTTON, M.D., ITHACA, N. Y.

The intraperitoneal use of sulfanilamide and sulfathiazole to combat infective processes is without question an established procedure. These drugs are most frequently applied in those infections secondary to acute appendicitis.

Sulfanilamide, the most frequently used, is said not to produce peritoneal adhesions. There is considerable evidence to support this view.<sup>1</sup> Several authors express the same conviction concerning sulfathiazole.<sup>2</sup> However, there is evidence<sup>3</sup> that it produces peritoneal irritation in the dog, while sodium sulfathiazole produces dense peritoneal adhesions in the same animal.<sup>3</sup>

A difference of opinion exists on the question of inhibition of wound healing after local implantation of these drugs,<sup>4</sup> but there seems little question that in certain instances this does occur.<sup>5</sup>

My purpose in this communication is to report a case of acute perforative gangrenous appendicitis with peritonitis in which the intraperitoneal use of sulfathiazole was followed by adhesions, intestinal obstruction and secondary operation. In this case implantation of sulfathiazole into the wound was followed by long delayed wound healing and a keloid scar.

#### REPORT OF CASE

A boy aged 10 years had been ill three days when seen on Sept. 23, 1941. The onset and progress during this time had been typical of acute appendicitis. The attack was initiated

by generalized abdominal pain with later localization in the right lower quadrant, nausea and vomiting. Examination revealed a temperature of 101.2 F and 20,600 leukocytes with 90 per cent polymorphonuclears. The abdomen was rigid over the right lower quadrant with exquisite tenderness on direct pressure and also rebound tenderness at McBurney's point.

At operation a gangrenous appendix was found with a small perforation. There was considerable thin purulent exudate about the appendix which was retrocecal in the iliac fossa. The peritoneum was injected but there were no adhesions. The organ was removed in the usual manner with inversion of the stump and 3 Gm of sulfathiazole crystals was sprinkled in the iliac fossa and on the adjacent peritoneum covering the cecum and ileum where the exudate had been abundant. A Penrose drain was inserted to this point and the peritoneum closed tightly around it. The rest of the wound was closed loosely after 2 Gm of sulfathiazole had been sprinkled throughout its entire extent. When he had recovered from the anesthetic he was given 0.5 Gm of sulfathiazole by mouth every four hours.

His convalescence was not remarkable. The drain was removed on the fifth day after discharging copiously, a sero-sanguinous fluid for the first seventy-two hours. Sulfathiazole crystals produced a troublesome bladder irritation for several days. The healing of the wound was retarded and was not complete until the twenty-eighth day. At that time the scar was elevated, very thick ( $\frac{1}{4}$  inch, or 0.6 cm), broad ( $\frac{1}{2}$  inch, or 1.3 cm) and tender.

After his dismissal from the hospital on October 14 he was well for one month when he began to have attacks of severe abdominal cramps. These had become progressively more severe and frequent but not at any time was there definite evidence of obstruction until on December 14 when he had another severe attack associated with nausea and vomiting. There was stormy defeated peristalsis and enemas returned clear. He was operated on immediately and a loop of ileum was found bound down to the parietal peritoneum posterior to the cecum. This produced a sharp kink with obstruction. The omentum was also firmly adherent at several points to the parietal peritoneum, the ileum and the cecum. No adhesions were present except in the area hereafter described. The peritoneum over an area corresponding exactly to that with which the sulfathiazole had been placed in contact was covered with a very fine reddish granular looking tissue. There were areas in which this was 2 by 5 mm thick. The surface had the appearance of pale granulation tissue and was attached to the surface of the peritoneum. The subserosal tissue was not invaded.

All the adhesions were freed, a piece of the abnormal tissue was excised for study and the wound closed without drainage. Microscopic study showed only dense connective tissue with many small blood vessels. There was no evidence of sulfathiazole crystals. The microscopic diagnosis was collagenous connective tissue. This same type of tissue was found in the abdominal scar which was excised at the initial incision. The thick surface scar described before extended through all layers of the abdominal wall, again the area corresponded exactly with the distribution of the crystalline sulfathiazole.

The convalescence was smooth, the wound healed by primary union with a hair line scar and the patient was discharged in excellent condition on the ninth postoperative day. Two months later he was without complaint and in splendid health.

#### COMMENT

It seems reasonable to suppose that the excessive production of fibrous tissue both in the wound and on the peritoneum with its attendant complication was caused by an unusual tissue response to sulfathiazole. He has several other scars which have shown no tendency to keloid formation.

The widespread area involved and the location of adhesions at divergent points but only where the sulfathiazole had been placed seem sufficient reasons to rule out the presence of the single Penrose drain as a causal factor in this unusual peritoneal reaction.

## ACQUIRED SENSITIVITY TO SULFONAMIDE DRUGS

JACK NELSON, M.D., NEW YORK

With the growing use of sulfonamide drugs the problem of sensitivity to these drugs is taking on added importance. Besides the reactions which are known to occur one to two weeks following the institution of therapy there are also seen early reactions characterized by fever, chills, rash and pruritus within a few hours after the administration of these drugs and often in response to minute doses. Salvin<sup>1</sup> in 1937 reported a case of such sensitivity to sulfanilamide. In 1939 Thompson<sup>2</sup> described a similar response to sulfapyridine. And in 1940 Davidson and Bullock<sup>3</sup> noted fever with chilliness, erythema, pruritus and conjunctival injection some hours after the administration of sulfamethylthiazole. As far as I am aware, such reaction has not previously been reported with sulfadiazine, presumably because this drug is the most recent addition to the group.

These reactions have been termed "hypersensitivity" or "acquired sensitivity" by most authors. Their nature is as yet

febrile response to the administration of sulfanilamide two years after the original dosage, which had been well tolerated.

Although reports of early reaction are few, there is reason to believe that the condition is far from rare. In an important study, Lyons and Balberor<sup>4</sup> gave two courses of sulfathiazole to each of 49 patients. The first course was uniformly uneventful. However, on administration of the second course (on an average of eight to nine days after the first) 18 of the 49 patients had a prompt febrile reaction, and half of these had chills, weakness and exhaustion. That is, approximately one third of the patients receiving a sulfonamide drug were rendered so sensitive as to interfere with its subsequent administration. This is a fact of great practical importance, particularly in view of the finding that any one sulfonamide derivative may bring about sensitivity to the others of the group. In the case of Davidson and Bullock the use of sodium sulfapyridine was followed by sensitivity to sulfapyridine and sulfamethylthiazole.

A case is reported of acquired sensitivity to sulfonamide drugs, including sulfadiazine, a case which exemplifies some of the problems already discussed.

## REPORT OF CASE

**History**—B. O., a white woman aged 62, was admitted to the hospital on Aug 22, 1941 with a history of hemoptysis for one day. Seventeen years previously there had been a pleuritic pain on the right side. Nine years before there had been hemoptysis of one month's duration. At neither time did she obtain medical attention. In May 1940 a diagnosis of inactive pulmonary tuberculosis was made. There were no further symptoms until January 1941, when the patient began to have hematuria and some dysuria, for which she was readmitted to New York Hospital. The abnormal findings were related mainly to the genitourinary tract, a walnut sized tender nodule was found at the urethral orifice, the urine showed a faint trace of albumin and an occasional pus cell, culture revealed *Escherichia coli* communis, direct microscopic examination of the urine and inoculation of a guinea pig failed to reveal tubercle bacilli. The roentgenogram showed bilateral apical apparently healed

Rise of temperature after administration of various sulfonamide derivatives

unclear. Except for the case of Salvin, in which there was no history of previous ingestion, the early reactions have occurred on repeated administration of the drug, the first course being tolerated either without incident or with fever and rash after eight to nine days. Patch tests and passive transfer have generally been negative, eosinophilia has not been the rule. It is stated that an interval of at least nine days is required after the initial administration for a prompt reaction to appear on repeat dosage. And, on this basis, some consider these reactions to be identical in nature with the drug fever which occurs about the ninth day of continuous administration. As to the duration of the sensitivity, Gallagher<sup>4</sup> reports a

pulmonary tuberculosis, three concentrates of the sputum were negative for that organism by microscopic examination. On the eighth day of hospitalization, cystoscopy revealed inflammation and purulent exudation at the trigone. The urethral caruncle was removed by means of a loop cautery. Postoperatively the temperature rose to 101.4°F, but it fell to normal on the fifth postoperative day. Beginning on that day sulfathiazole was administered for the persistent cystitis, 1 Gm every four hours, until discharge three days later. During this time there was no temperature rise nor any other untoward reaction. The concentration of sulfathiazole in the blood was not measured. The patient asserted that following discharge from the hospital she noted no ill effects, and she remained asymptomatic until the small hemoptysis which occasioned the present admission. There was no past history of any allergy or of any contact with tuberculosis.

**Physical Examination**—The patient was thin. She did not appear acutely ill, and the temperature was normal. The

important abnormal findings were a few moist rales at the right pulmonary base and impairment of the percussion note below the left clavicle. Pelvic examination revealed slight inflammation at the urethral orifice.

**Laboratory Examination.**—A roentgenogram of the chest showed moderate fibrosis and emphysema with blunting of the left costophrenic sinus and productive nodular infiltration with pleural thickening at the left apex. The urine showed a very faint trace of albumin and 60 to 75 white blood cells per low power field many in clumps. The blood showed 3,500,000 erythrocytes per cubic millimeter, hemoglobin 11 Gm leukocytes 7,600 polymorphonuclears 64 per cent, lymphocytes 31 per cent monocytes 1 per cent and stab cells 3 per cent. The Wassermann reaction was negative the sedimentation rate 42 mm an hour. Sputum concentrates were microscopically negative for tubercle bacilli.

**Course.**—There was no hemoptysis after admission. The patient remained asymptomatic except for some urgency and frequency. The finding of pyuria together with the previous history led to the diagnosis of chronic cystitis and urethritis. Accordingly, on the eighth hospital day sulfathiazole was administered, 5 Gm was given in the course of forty-eight hours. The day following the institution of this therapy the temperature rose precipitously to 103.6 and then to 104.4 F. At this time there were slight nausea and retching, moderate headache with 'swimming' feeling in the head and pronounced malaise. Physical examination was not revealing. The urine was normal but for a very faint trace of albumin the leukocyte count was 5,700 with 66 per cent mature and 29 per cent immature polymorphonuclear cells 3 per cent lymphocytes and 2 per cent monocytes, there were no eosinophils. Urine culture revealed *E. coli* communis. The sulfathiazole was discontinued after a total of 5 Gm had been given. Within twelve hours the feeling of 'fulness and swimming' in the head which had been the most distressing symptom, had cleared, and within two more days the temperature returned to normal. It was felt that we were dealing with a reaction to sulfathiazole by a patient who had previously not displayed such a reaction. The repeated administration of this and other sulfonamide drugs was planned in order to test the degree and extent of this sensitivity. The patient's subsequent course can best be summarized with the aid of the temperature chart.

On the twenty-second hospital day, in the presence of a normal temperature and leukocyte count but with numerous leukocytes in the urine, sulfathiazole was again administered. A total of 4 Gm was given. Six hours after the first dose the temperature abruptly rose to 102.2 F. During this and the following day, in which the temperature reached 103.8 F and the leukocyte count 13,700 with 92 per cent polymorphonuclears and no eosinophils, the patient complained of headache and a "swimming" feeling in the head, nausea and vomiting, and she exhibited a morbilliform rash over the forehead. The blood showed 3.45 mg of sulfathiazole per hundred cubic centimeters. On discontinuance of the drug the symptoms promptly disappeared and the temperature fell to normal on the third day.

On the thirtieth hospital day the administration of 2 Gm of sulfathiazole was followed by an identical reaction after six hours. The blood showed 3.1 mg of sulfathiazole per hundred cubic centimeters.

On the thirty-eighth hospital day 4 Gm of sulfadiazine was administered in divided doses. Within eight hours there was a temperature rise to 101.2 F and a reaction identical with the reactions previously noted but for the absence of rash. The blood showed 3.3 mg of sulfadiazine per hundred cubic centimeters.

On the fiftieth hospital day 4 Gm of sulfapyridine was administered in divided doses. The patient complained of nausea and vomiting of such severe degree that she refused further doses. But she did not have headache, a 'swimming' feeling of the head or any rash and she stated that she did not feel at all as she had felt after the previous drugs. There was no febrile response. The blood showed 5.1 mg of sulfapyridine per hundred cubic centimeters.

On the sixty-fourth hospital day 10 Gm of sulfanilamide was given in divided doses in the course of two days. After twenty-four hours the temperature rose to 101.2 F and the patient manifested symptoms identical with those which had followed sulfathiazole and sulfadiazine except for the absence of rash. The blood showed 6.6 mg of sulfanilamide per hundred cubic centimeters.

No further drugs were administered. The patient remained afebrile and asymptomatic and without change in the pulmonary status till discharge on the seventy-sixth hospital day.

#### SUMMARY

A case was observed of acquired sensitivity to sulfathiazole seven months after an initial course was tolerated without reaction. The sensitivity included sulfadiazine and sulfanilamide. Sulfapyridine was administered without similar reaction, but the prompt withdrawal of the drug precludes definite decision in this regard.

#### COMMENT

Prompt febrile reactions such as those described are not rare. Indeed since many patients have been treated with sulfonamide drugs (often for minor ailments) it is likely that the reaction of acquired sensitivity will be seen with increased frequency. This is a matter of some importance and deserves investigation.

#### FATAL ANURIA FOLLOWING SULFADIAZINE THERAPY

C. ALEXANDER HELLWIG, M.D.

AND

H. LESTER REED, M.D.

WICHITA, KAN.

The literature contains reports on nearly 1,000 patients treated with sulfadiazine. Only 2 instances have been recorded in which urinary suppression followed the administration of this compound. In both cases cystoscopy and pelvic lavage promptly relieved the renal failure.<sup>1</sup>

In contrast to these clinical reports, which suggest a low toxicity of sulfadiazine, observations on experimental animals are less optimistic. Lehr and Antopol<sup>2</sup> found that, in albino rats, sulfadiazine may produce acute precipitation of the free acid in the renal tubules and because of the poor solubility of the drug severe degeneration of the tubular epithelium may result.

Gross, Cooper and Hagan<sup>3</sup> gave sulfadiazine in different doses to mice and rats. Of 70 mice, 15 died following the medication. In one third of all the animals almost all collecting tubules were blocked by crystalline masses. In about one fifth of the animals crystals were found also in the convoluted tubules.

The following case of fatal anuria after sulfadiazine therapy which we observed at St. Francis Hospital is reported to emphasize the fact that sulfadiazine is not as harmless as the preliminary claims made for this new compound would suggest.

#### REPORT OF CASE

R. L. B., a white man aged 29, was admitted to the hospital Jan. 23, 1941, because of fever, cough and pain in the chest. He had been treated at home for two weeks and had received during the last three days 45 grains (3 Gm.) of sulfadiazine daily.

On admission the temperature was 99.6 F., the pulse rate 100 a minute and the respiratory rate 24. The leukocyte count was 9,000 per cubic millimeter and the hemoglobin content 18 Gm. per hundred cubic centimeters. The specific gravity of the urine was 1.020; the reaction was acid. Chemical tests

for albumin, sugar and blood were negative. The sediment contained very few crystals of sulfadiazine.

The throat of the patient was red. Numerous coarse rales were audible over both sides of the lungs, especially over the right lower lobe. The patient received 15 grains (1 Gm) of sulfadiazine every four hours. On the next day the leukocyte count was 12,800 per cubic millimeter with 16 per cent stab forms, 60 per cent segmented and 18 per cent lymphocytes. The temperature was 101.2 F and the pulse rate 120. A roentgenogram of the chest showed mottled dense areas throughout the right lung and to a less extent also in the left lung, suggesting bronchopneumonia. The sputum contained many pneumococci. Attempts to type the organisms with the Neufeld method and after mouse inoculation were unsuccessful. In the sediment of the urine many red blood cells were present.

On January 27 an erythema appeared over the whole body. The urinary output during twenty-four hours was only 390 cc in spite of intravenous administration of 2,500 cc of fluid. The concentration of blood urea was 74 mg per hundred cubic centimeters. Sulfadiazine was discontinued and the patient was referred for cystoscopic examination. No urine was found in the bladder. Both ureteral orifices were swollen and hemorrhagic. After the catheters were passed into the renal pelvises dark brown urine was obtained. Both renal pelvises were irrigated with warm distilled water. The first specimens obtained through the catheters had 250 mg of sulfadiazine per hundred cubic centimeters.

On January 29 only a few cubic centimeters of bloody urine was voided. The temperature rose to 107 F, the pulse rate was 144 and the respiratory rate 36. Large liquid stools were passed and there was profuse sweating. The patient became comatose and died ten days after sulfadiazine therapy had been started, twenty-six hours after it had been discontinued.

The total amount of sulfadiazine given during the nine days was 360 grains (24 Gm).

Necropsy was performed by one of us (H L R). The pertinent findings were as follows:

The two kidneys were similar. The right kidney weighed 176 Gm, the left 210 Gm. The capsule stripped easily, leaving a smooth surface. The superficial blood vessels were dilated. The cortex was 8 mm thick, the striations of the pyramids were unusually distinct. Fine, glistening, whitish stippling

Fig 1—Section of a kidney in a case of fatal anuria following the use of sulfadiazine, severe degeneration of epithelium in convoluted tubules and in ascending limbs of Henle's loops ( $\times 75$ )

was noted in the lower portion of the pyramids outlining the course of the collecting tubules. The renal pelvises and the upper thirds of both ureters were completely filled out with dark coagulated blood. In the blood clots small whitish concretions of sulfadiazine were recognized. There were many petechiae in the mucosa of the pelvises and ureters.

Microscopically most glomeruli appeared normal. In a few tufts capillary thrombi and small hemorrhages were found.

The spaces of Bowman's capsules seemed slightly dilated and several contained granular, light blue stained, albuminous material. The basement membrane in most of the malpighian bodies was thin and the nuclei were well stained. There was widespread injury to the convoluted tubules (fig 1). Their epithelial cells were swollen, many nuclei were unstained, the cytoplasm was vacuolated and stained deep red. Finest hyaline

Fig 2—Focal necrosis in the liver following the use of sulfadiazine ( $\times 75$ )

granules could be demonstrated in the tubular epithelium with Sudan stain. The descending limbs of Henle's loops appeared normal, while the thick ascending limbs showed the same severe cellular degeneration as the convoluted tubules. There were hyaline casts and occasionally crystals of sulfadiazine in the lumens of the convoluted tubules. Calcification of degenerated epithelial cells, as described by Lehr and Autopol in experimental animals after sulfadiazine medication, was absent in our case. While in most sections the collecting tubules were of normal structure, some of the terminal portions in the renal papillae showed cystic dilatation. There was desquamation of the epithelium and the lumens contained crystals of sulfadiazine.

The epithelium of the calices and of the ureters was destroyed in many places. Large hemorrhages were found in the subepithelial tissue and plasma cells, lymphocytes and leukocytes were numerous.

Microscopic examination of the liver revealed few small areas of necrosis of the liver cells with round cell infiltration. In the epicardium, edema and infiltration with leukocytes and plasma cells were noted. There was no evidence of interstitial myocarditis as observed by French and Weller<sup>4</sup> after the use of sulfonamide drugs.

The anatomic diagnosis was bilateral bronchopneumonia (pneumococcal), subacute pericarditis, focal necrosis of liver parenchyma, large spleen, severe degeneration of the epithelium of the convoluted tubules and ascending limbs of Henle's loops, cystic dilatation of the terminal portion of the collecting tubules, blood and sulfadiazine concretions in the renal pelvises and ureters, and hemorrhagic pyelitis and ureteritis.

#### COMMENT

The histologic findings in our case are not in accord with the belief of most clinicians<sup>5</sup> that renal failure after sulfadiazine therapy is caused by mechanical blocking of the urinary passages and not by actual tissue damage due to toxicity of the drug. In our case, the most striking alterations were present in the convoluted tubules. The severe degenerative changes that we observed in the tubules were similar to those seen in mercuric poisoning. It is our contention that

4 French A J and Weller C V. Interstitial Myocarditis Following the Clinical and Experimental Use of Sulfonamide Drugs. *Am J Path* 18:109, 1942.

5 Dourmashkin R L and Worton M. Anuria Due to Bilateral Ureteral Impaction with Concretions Following Sulfapyridine in Pneumonia. *New York State J Med* 41:1, (1) 1941.

the histologic study of our case and on experimental observations of Lehr and Antopol that sulfadiazine is a tubular poison and that anuria may follow the use of this drug not from interference with renal drainage but from degeneration of the tubular epithelium. Richards<sup>6</sup> pointed out that poisoning of the tubular epithelium permits water to pass back into the blood by simple diffusion. In this way complete anuria may follow the administration of a tubular poison though filtration in the glomeruli continues.

If our contention is correct then we have to regard anuria following sulfadiazine as a much more serious complication than is generally believed. If the suppression of urine is caused not by simple mechanical blocking of the lower urinary passages but by damage of the tubular epithelium lavage of the renal pelvis and ureters may not relieve the anuria as in our case.

#### SUMMARY

Death in the case reported was due to renal failure following sulfadiazine medication. The total amount of the drug given during nine days was less than 24 Gm. Cystoscopy with irrigation of the renal pelvis and ureters intravenous administration of fluid and alkalization were without success.

The kidneys showed severe degeneration of the convoluted tubules similar to that seen in mercuric poisoning. Our studies suggest that anuria following sulfadiazine may be due to actual tissue damage rather than mechanical blocking of the lower urinary passages.

It is not our intent in this report to discourage the use of sulfadiazine but to call attention to a possible toxicity of the drug to the renal epithelium.

Since lavage of the renal pelvis and ureters will not relieve renal failure caused by tissue damage prevention of renal complications cannot be overemphasized.

Careful attention to the daily urinary output of patients receiving sulfadiazine appears to be a simple and efficient method to prevent renal failure.

## Council on Pharmacy and Chemistry

### REPORT OF THE COUNCIL

THE COUNCIL HAS AUTHORIZED PUBLICATION OF THE FOLLOWING STATEMENT  
AUSTIN E SMITH M.D. Acting Secretary

#### HEXESTROL, NONPROPRIETARY DESIGNATION FOR DIHYDRODIETHYLSTILBESTROL

Bishop and his co-workers (*Lancet*, April 6, 1940, p 629) have suggested that the synthetic estrogen dihydrodiethylstilbestrol may be of value as an estrogen. A pharmaceutical firm informed the Council's office that it contemplated the preparation of quantities of this substance for clinical trial, pointing out that the name suggested by Dodds for this compound is hexoestrol or, as the spelling would be in this country, 'hex-estrol'.

Realizing the great value of timeliness in matters of nomenclature, the Council gave consideration to the matter of an acceptable name to forestall the development of several names or a name that might be otherwise unacceptable.

The Council has considered a number of proposed terms to signify the substance dihydrodiethylstilbestrol. These were considered unsatisfactory nor could any other term be coined which possessed a root that would be more specific from a chemical standpoint for this compound than 'hex-'. Under these conditions the Council approved of the term hexestrol inasmuch as it has been the exclusive designation for this compound since it was first described.

### NEW AND NONOFFICIAL REMEDIES

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION.

AUSTIN E SMITH M.D. Acting Secretary

**CALCIUM GLUCONATE** (See New and Nonofficial Remedies 1941, p 176)

The following dosage form has been accepted

GEORGE A. BREON & COMPANY, INC., KANSAS CITY, MO

Calcium Gluconate Solution 10% W/V 10 cc ampuls. Each ampul contains a sterile distilled water solution of calcium gluconate-U S P 10 Gm, stabilized with calcium d-saccharate 0.02 Gm.

**SOLUTION OF EPINEPHRINE HYDROCHLORIDE-U S P** (See New and Nonofficial Remedies, 1941, p 254)

The following dosage form has been accepted

GEORGE A. BREON & COMPANY, INC., KANSAS CITY, MO

Solution Epinephrine Hydrochloride 1:1,000 1 cc ampul. A brand of solution epinephrine hydrochloride-U S P containing chlorobutanol 0.5 per cent and sulfurous acid not more than 0.06 per cent in isotonic solution of sodium chloride.

**PYRIDOXINE HYDROCHLORIDE** (See THE JOURNAL Jan 10 1942, p 140)

The following dosage form has been accepted

MERCK & CO., INC., RAHWAY, N. J.

Crystals Hexabione Hydrochloride 0.05 Gm and 0.1 Gm sealed tubes.

**SULFATHIAZOLE** (See New and Nonofficial Remedies, 1941 p 519)

The following dosage form has been accepted

MCKENIL LABORATORIES, INC., PHILADELPHIA

Tablets Sulfathiazole 0.5 Gm (7½ grains)

**LIVER AND STOMACH PREPARATIONS** (See New and Nonofficial Remedies 1941, p 328)

**REFINED SOLUTION LIVER EXTRACT PARENTERAL-LEDERLE** (See THE JOURNAL Nov 15, 1941, p 1706)

The following dilution dosage form has been accepted

LEDERLE LABORATORIES, INC., PEARL RIVER, N. Y.

Refined Solution Liver Extract Parenteral, 5 U S P injectable units per cc. 5 cc and 10 cc vials.

**MERCURIC SALICYLATE** (See New and Nonofficial Remedies 1941 p 349)

The following dosage forms have been accepted

THE LAKESIDE LABORATORIES, INC., MILWAUKEE

Ampul Solution Mercuric Salicylate (in oil) 0.065 Gm (1 grain) 0.097 Gm (1½ grains) 0.13 Gm (2 grains) in 1 cc. Each ampul contains mercuric salicylate U S P suspended in vegetable oil containing 3 per cent chlorobutanol.

**PERCOMORPH LIVER OIL** (See New and Nonofficial Remedies 1941 p 577)

FLINT CATON & COMPANY, DECATUR, ILL.

Oleum Percomorphum 8 cc bottle.

**AMPULS OF CAMPHOR** (See New and Nonofficial Remedies 1941 p 178)

The following dosage form has been accepted

GEORGE A. BREON & CO., INC., KANSAS CITY, MO

Ampuls Camphor in Olive Oil 1 cc. Each cubic centimeter contains camphor 0.2 Gm (308 grains) in olive oil q. s.

**SODIUM CITRATE** (See THE JOURNAL June 7 1941 p 2597 and Revised Supplement to N. N. R., 1941 p 26)

The following dosage form has been accepted

LAKESIDE LABORATORIES, INC., MILWAUKEE

Ampuls Sodium Citrate 2.5% 50 cc.

SATURDAY, JUNE 13, 1942

## VITAMIN C AND WOUND HEALING

Many factors investigated in recent years, including vitamins, have been claimed to influence the healing of wounds. Attention has been drawn to vitamin C in particular because of the frequently noted fact that spontaneous breakdown of surgical wounds in the absence of infection occurs commonly in patients with cachexia and in young patients, especially those who have some congenital anomaly of the gastrointestinal tract. In all these groups of patients there is likelihood of deficiency of ascorbic acid. With the newer methods of estimating more accurately the ascorbic acid content of tissues, tests and experiments have been devised aimed at the accurate evaluation of the role of vitamin C in wound healing.

Lanman and Ingalls<sup>1</sup> in 1937 recorded observations on the behavior of wounds in guinea pigs under the influence of varied vitamin C content of tissues. They concluded that vitamin C plays an important part in the healing of experimentally produced wounds in guinea pigs and suggested that there may be in human beings a degree of vitamin C deficiency that cannot be recognized by ordinary methods of physical examination but which may be significant in this regard. These conclusions were later confirmed by Taffel and Harvey<sup>2</sup>. Now Bartlett, Jones and Ryan,<sup>3</sup> in studies based on experimental wounds in guinea pigs and on observations of healing wounds in human beings, clarify still further the part played by vitamin C.

For their animal experiments one group of guinea pigs was maintained on a scorbutic diet for two weeks. Then an abdominal incision was made and a control biopsy obtained. The scorbutic diet was continued postoperatively, and at arbitrary intervals varying from four to fourteen days the animals were killed and tissue assays done, however, a significant variation in

the tissue levels at the shorter and longer postoperative intervals was not observed. Another group of 10 pigs was given a high ascorbic acid intake for a preliminary period of two weeks and submitted to similar operation and tissue assays at varying intervals. Again a significant difference in the results was not obtained at the shorter and longer postoperative intervals, however, a definite increase in ascorbic acid content of the healing wound over that of the control biopsy of the abdominal wall was found. In the final group of animals the tensile strength of the abdominal incision was determined and compared with the ascorbic acid content of the tissue. This was done by inflation of the peritoneal cavity with air until rupture of the wound occurred, the pressure necessary to produce rupture was recorded by a manometer in millimeters of mercury by a method similar to that used by Lanman and Ingalls. The ruptured wounds were then excised and the adjacent tissue was assayed for ascorbic acid content. Variations of ascorbic acid content could be demonstrated in a healing wound of the abdominal wall depending on the vitamin C intake. On a high ascorbic acid intake a striking increase in vitamin C content of the wound over that of the control biopsy occurred. Furthermore the tensile strength of wounds with a high content of ascorbic acid was demonstrated to be much greater than that of wounds with low vitamin C values.

Although the effect of prolonged reduced intake of vitamin C on wound healing in otherwise normal subjects has been studied before, the microscopic appearance of the wound alone was used as an index of abnormal healing. The human wound studies of Bartlett and his co-workers were undertaken in an attempt to obtain further information on this subject by means of direct observations on the tensile strength of healing wounds and to correlate these with the tissue content of ascorbic acid and the plasma levels of ascorbic acid. Six men subjected to repair of inguinal hernias, on whom the use of fascia lata in the repair was contemplated, were selected for study. During the preliminary preoperative period of two to four days the plasma ascorbic acid was determined and the daily urinary output measured. Throughout the hospital stay the patients were maintained on a diet containing 100 mg of vitamin C daily. Supplementary ascorbic acid was given to some patients before and after operation. The wounds were allowed to heal for ten days, the skin sutures being removed on the eighth day. At the end of ten days the skin incision in the thigh was excised with a margin slightly less than 1 cm of skin on each side of the scar. An incision in the fascia was excised with the same margin of tissue. The tensile strength of the healing wound and the ascorbic acid content of the tissue were determined on the skin and fascia. This was measured by the application of a direct pull on the healing scar by means of a simple apparatus. As a result, however, duplicate determinations of portions of the same scar and scars it became evident that there was con-

2 Taffel, M., and Harvey, S. C. Effect of Absolute and Partial Vitamin C Deficiency on Healing of Wounds, *Proc Soc Exper Biol & Med* 38: 518 (May) 1938.

3 Bartlett, M. K., Jones, C. M., and Ryan, A. E. Vitamin C and Wound Healing. I. Experimental Wounds in Guinea Pigs, II. Ascorbic Acid Content and Tensile Strength of Healing Wounds in Human Beings, *New England J Med* 226: 469 (March 19) 1942.

variation of tensile strength when measured by this method, and only gross differences should be considered significant. With the exception of 1 case the Boston investigators could not find a significant variation in the behavior of the healing fascia regardless of the variation in the preoperative content of ascorbic acid in the plasma. With the 1 exception mentioned, the ascorbic acid contents of the control biopsies of fascia were fairly consistent. They believe, therefore, that the tensile strength of the specimens obtained from these 5 patients could be considered normal and that even a plasma ascorbic acid level as low as 0.2 mg. per hundred cubic centimeters (contrary to most previous opinions) would not cause a significant variation from normal in vitamin C content or tensile strength of healing fascia. The 1 exceptional case however, demonstrates conclusively, they believe, two points: (1) that a sufficient depletion of vitamin C reflected in a low plasma ascorbic acid interferes with normal wound healing as measured by tissue ascorbic acid content and tensile strength, and (2) that normal wound healing can be brought about by adequate vitamin C therapy during the healing period in spite of a low plasma ascorbic acid at the time of operation.

These observations would seem to imply that under usual conditions of diet and absorption the average person possesses a high enough ascorbic acid content in tissue for normal wound healing. The practical question, however, is the determination by a simple method, of which persons require supplementary vitamin C administration preoperatively or postoperatively. The answer to this question is not yet clear.

#### DEATHS OF PHYSICIANS IN 1941

Last year 3,527 obituaries of physicians were published in *THE JOURNAL*. Of the total 3,354 were residents of the United States and 173 of Canada. Two physicians died in Puerto Rico, 3 in the Philippine Islands, 2 in Hawaii and 1 in China. One was killed in West Africa while serving as captain in the British Army. The total group included 122 obituaries of women physicians.

Some obituaries are reported too late for publication and some are withheld for lack of suitable data with which to compile a satisfactory notice. Thus 241 more deaths were totaled in the American Medical Directory Report Service, including the United States possessions and Canada, than were listed in 1941 in *THE JOURNAL*. A total of 3,460 is considered here for the United States alone or 106 more than the 3,354 deaths reported in *THE JOURNAL*.

For the academic year ended in June 1942 there were 5,275 graduates of medical schools in the United States. Deducting the number of physicians whose obituaries were published, there was an indicated net increase to the profession of 1,921. Including those who received their first license to practice medicine

during the calendar year, there was a gain of 2,327. This difference is accounted for principally by graduates of foreign schools.

**Age**—The average age at death of those classified as of the United States was 65.9 as compared with 66.3 years for a total of 3,450 deaths published in 1940. Thirty physicians died between the ages of 25 and 29, 42 between 30 and 34, 72 between 35 and 39, 102 between 40 and 44, 151 between 45 and 49, 210 between 50 and 54, 361 between 55 and 59, 459 between 60 and 64, 510 between 65 and 69, 518 between 70 and 74, 413 between 75 and 79, 299 between 80 and 84, 131 between 85 and 89, 50 between 90 and 94, 1 between 95 and 100 and 4 were 100 or over. The exact age of death was unknown in 1 case.

**Causes**—Heart disease again accounted for the greatest number of deaths among physicians. As is customary, contributory causes have been included in the tabulation. Coronary thrombosis and occlusion led the list with 1,034 deaths. Other coronary diseases totaled 119. Other diseases of the heart and circulatory system accounted for 781 deaths. Four hundred and two were classified under cerebral hemorrhage and 353 under arteriosclerosis. Cancer and tumors in various forms accounted for 328 deaths. Tuberculosis was designated the cause in 39 deaths, diseases of the blood and lymphatic system in 35, diabetes in 56, bronchopneumonia in 197, lobar pneumonia in 58, other diseases of the respiratory system in 62, allergy and asthma in 5, appendicitis in 14, peptic ulcers (stomach or duodenum) in 26, other diseases of the gastrointestinal tract in 107, cirrhosis of the liver in 41, acute nephritis in 26, chronic nephritis (including cardiovascular renal and cardiorenal disease and uremia) in 219, diseases of the genitourinary system in 36, bacteremia and other infectious diseases in 39, influenza in 24, abscesses and carbuncles in 10, acute and chronic rheumatism in 6, diseases of the thyroid in 2, postoperative in 21, Addison's disease in 1, alcoholism in 3, poliomyelitis in 3, pulmonary embolism in 16 and other ill defined or unspecified causes and senility in 90. Each of the following accounted for 1 death: typhus fever, toxemia of pregnancy, tetanus and heat prostration. Two deaths were attributed to Rocky Mountain spotted fever.

**Accidental Deaths**—There were 152 accidental deaths in 1941. Automobile accidents accounted for 83 deaths as compared with 105 in 1940. Other accidents were falls 21, burns 7, airplane accidents 6, drowning and poison 4 each. One death was recorded in a train accident, and 4 involved automobile and train collisions. Twelve unexplained fractures were included in the accidental deaths. One physician was killed when he fell down an elevator shaft, and another was electrocuted by a short circuit in an x-ray machine. One accidental death was ascribed to x-ray burns. Bullet wounds, carbon monoxide explosions, overdoses or

medicine and asphyxiation were among the causes of accidental deaths classified in 1941 reports

*Suicides and Homicides*—Suicides accounted for 67 deaths in 1941. Bullet wounds led the list with 25. Carbon monoxide, poison and drugs were next in classification of method with 7 deaths each, hanging 6, cut artery 5, illuminating gas 3, drowning 1, and 1 death occurred from a fall. In 5 cases the method was not reported. Four homicides were recorded.

*Civil Positions*—Among the decedents were 191 physicians who were or had been teachers in medical schools, 518 who had served in World War I, 157 veterans of the Spanish American War and 5 Civil War veterans. One hundred and twenty-three physicians were or had been health officers, 101 members of boards of education, 86 members of boards of health and 21 members of boards of medical examiners. There were 58 coroners, 44 mayors, 32 authors, 31 bank presidents, 17 editors and 17 legislators. 14 police surgeons, 13 missionaries, 12 dentists, 11 members of city councils, 9 pharmacists, 8 senators, 7 clergymen, 6 lawyers, 5 postmasters, 4 fire surgeons, 1 sheriff, 1 justice of the peace and 1 governor. One was a member of the U. S. Pharmacopeia and 1 was a member of the state board of agriculture. One had formerly served as a British vice consul.

There were 19 who had served in the regular medical corps of the U. S. Navy, 17 served in the regular corps in the U. S. Army, 19 in the U. S. Public Health Service, 7 in the Veterans' Administration and 4 in the Indian Medical Service.

*Association Officers*—Among those who died, 1 had been President of the American Medical Association, 2 had been Vice President, 19 section officers and 4 members of councils. Thirty-nine had been members of the House of Delegates, 38 presidents of state medical associations and 4 secretaries. One hundred and eighty-seven were or had been presidents of county medical societies.

## Current Comment

### FOOD VALUE OF BEER

British opponents of the brewing industry, quick to take advantage of war conditions, have called attention to the fact that an appreciable percentage of all available English grain is now being used for the production of beer. They allege that this grain would be of greater social value if used for the raising of poultry or pigs. "Pigs versus beer" has thus become a current political slogan. The brewers of England<sup>1</sup> have countered by quoting experimental evidence previously published by nutritional experts of London University. Waller, for example, found that the food value of beer is more than half that of the grain and other material used in its production, while pig meat has less than one fifth the food value of the same materials if used in raising swine.

Moreover, 25 per cent of the food value of the grain used in brewing is returned to the farmer in the form of brewers' grains, malt culms or yeast, foods especially high in vitamin content and nutritive value if used in the animal industry. The use of beer has also been under investigation by the food controller, who finds "no evidence that beer is doing anything to increase crime or bad health, or to reduce the output of munitions." From such testimony it is officially concluded by the British cabinet that "it is in the public interest that the production of beer should continue at the present amount" (4 per cent of all available grain).

### THE FEDERAL TRADE COMMISSION

The annual report of the Federal Trade Commission for the year ended June 30, 1941 summarizes some interesting factual data concerning the work of this commission. The commission charged false and misleading representations in advertising and labels and otherwise in 219 complaints. Of these, 96 alleged false and misleading representations as to the therapeutic value of various medicinal and food preparations and devices, 22 alleged misrepresentations as to the potency, performance or results to be obtained by the use of various products, and 22 charged misrepresentation as to composition, quality, ingredients, instruction or condition, including alleged misrepresentation of old products for new. Summary of several charts indicates that in 1921, the commission disposed of 153 complaints, 116 of which resulted in orders to cease and desist, whereas in 1941 the commission disposed of 407 complaints, of which 348 resulted in cease and desist orders. In 1921 there were 14 lower court proceedings, only 2 of which resulted in a decision for the commission, whereas in 1941 there were a total of 35 decisions out of 44 in favor of the commission in the lower courts. In 1921 513 applications for complaints were disposed of, with only 156 resulting in actual issuance and none in stipulation to cease and desist, whereas in 1941 the commission disposed of 1,364 applications for complaints, which resulted in actual issuance of 332 complaints and 498 settlements by stipulations to cease and desist. During the past year the commission was also being requested to perform the same relative duties as in 1917 and 1918, when it made approximately 370 investigations of war time costs, prices and profits covering such basic commodities as coal, steel and iron, building materials and cotton textiles. During the fiscal year reported, the commission aided the Office of Production Management and the Office of Price Administration. Other activities in connection with the national defense program included an investigation of price increases in the bread and bakery industry and an investigation in connection with the priorities orders in the steel industry. These added duties should not be permitted to lessen the diligence of the commission in executing its functions in the maintenance of honesty and fair trade in the more ordinary channels of commerce. The Federal Trade Commission has played an important part in the maintenance of the national economy and national health, and the continuance of such action is paramount to the welfare of the nation.

# MEDICINE AND THE WAR

*In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association announcements by the Surgeon Generals of the Army, Navy and Public Health Service and other governmental agencies dealing with medicine and the war, and such other information and announcements as will be useful to the medical profession*

## DECONTAMINATION SERVICES

Operations Letter No 42 dated May 20 1942 presented here in an abridged form sets forth the recommendations of the Office of Civilian Defense Washington D C for the organization and administration of decontamination services

### I DECONTAMINATION OF PERSONS

The decontamination of persons is the responsibility of the Emergency Medical Service Military authorities consider the use of gas against American cities unlikely It is desirable, however that key personnel be trained and that plans be prepared so that facilities can be improvised and placed in operation on short notice if necessary

Decontamination stations should be of simple construction with facilities for disrobing bathing and chemical neutralization of agents that may have reached the skin Wood is to be avoided because it absorbs mustard or lewisite and is difficult to decontaminate Brick concrete or metal structures are preferable All porous materials including brick and concrete should be painted with sodium silicate paint Gasoline filling stations are widely distributed in most communities and offer many advantages in view of their isolation washing facilities and comparatively impervious construction

The chief of Emergency Medical Service is responsible for organizing and training medical and other personnel to operate decontamination stations Physicians and nurses must know (1) how to protect themselves while handling contaminated cases (2) the effects of the various agents on the eyes skin and respiratory tract, (3) measures for decontamination of skin and eyes at various stages after exposure Stations for ambulant personnel do not necessarily need a physician in attendance but the person in charge should understand the dangers and limitations of chemical decontamination He should also be on the alert for victims with respiratory tract eye or severe skin exposure, who should be transferred to a hospital as soon as decontaminated All members of emergency medical field units should be trained and drilled in decontamination

The chief of Emergency Medical Service may appropriately request the local health department to establish and staff facilities for decontamination of uninjured persons Decontamination services organized and staffed by the health department for the decontamination of persons will operate as a branch of the Emergency Medical Service under the commander of the Citizens' Defense Corps

### II DECONTAMINATION OF STREETS BUILDINGS AND VEHICLES AND OF FOOD AND WATER SUPPLIES

The chief of Emergency Public Works has responsibility for organization training and administration of decontamination squads Their first task is rough decontamination of areas and of things in those areas They will use equipment especially street flushing machines which presumably will be found in the public works department of the usual municipality

Their first responsibility is the decontamination of streets, public buildings and the approaches thereto

The inspection and testing for gas contamination and the decontamination of food and public water supplies is the responsibility of the municipal health department

### III APPOINTMENT OF GAS OFFICERS

It is suggested that the commander of Citizens' Defense Corps appoint as a member of his staff, a senior gas officer who normally will be chosen from the city health department His functions will be to supply technical direction and assistance with respect to action to be taken before during and after gas attacks

*Duties of the Senior Gas Officer*—A During the period of preparation 1 He should become familiar with the chemistry of war gases and the technics and chemistry of decontamination This information can be acquired from the Office of Civilian Defense publications and by attendance at the War Department civilian protection schools and at special schools being established by the medical division of the Office of Civilian Defense in cooperation with the U S Public Health Service and the War Department schools

2 He should recommend for appointment assistant gas officers with qualifications similar to his own and train them to serve as his technical assistants to supervise decontamination of food and water

3 He should with the Chief of Emergency Medical Service select the sites for decontamination stations and provide consulting and technical service in the design and construction of these facilities

4 He should instruct laundries in the technics of handling various types of contaminated clothing and arrange for the safe transfer of contaminated clothing from decontamination stations to laundries and for the return of clean clothing For this purpose he may appoint a Laundry Officer from the trade in the city

B During the period of operation The senior gas officer and his staff will be responsible for

1 Identification of chemical agent or agents used in an area

2 Determination of the extent of the area contaminated and advice to wardens and police in the vicinity concerning type of agent and extent of contamination

3 Inspection and technical advice concerning the decontamination of streets and buildings and reports to the police and wardens when an area is safe for movement

4 Inspection of food and water supplies and supervision of proper measures for their decontamination

5 Collection and safe transportation to laundries of contaminated clothing and return of clean clothing to decontamination stations or hospitals (through laundry officer)

6 Inspection and technical control of decontamination of vehicles equipment and machinery including ambulances and other vehicles used in the transportation of casualties

JAMES M LANDIS, Director,  
Office of Civilian Defense

## ADAPTING GASOLINE FILLING STATIONS FOR DECONTAMINATION

Persons contaminated with liquid vesicants must be treated within five minutes to avoid severe burns Complete preparations would therefore require that facilities be sufficiently numerous so that every individual is within five minutes walk of a decontamination station Gasoline filling stations are widely distributed and may be adapted for this purpose

The Office of Civilian Defense, Washington D C has made the following suggestions for adapting gasoline filling stations for decontamination

1 Use stations with washing and greasing facilities under cover

2 Establish temporary disrobing area outside and adjoining washroom shielded by canvas parked automobiles or other device providing some privacy Allow abundant natural ventilation Every one entering disrobing area must walk through

a box of sand and bleaching powder to decontaminate his shoes (three parts of sand to one part of bleach containing 30 per cent hypochlorite)

3 Provide gas lock to washroom with foot bath of bleach slurry of sodium hypochlorite solution

4 Install temporary showers or improvise pipe with several outlets for multiple bathing Use hoses operated by attendants for washing large numbers of people Supply soap

5 Eyes should be irrigated with soda near entrance of washroom or hosed gently with plain water in the event of large numbers

6 Use grease room for dressing

7 Partition off grease room from washroom with wall board or other temporary material if the rooms are not already separated

8 Provide a gas lock between wash and dressing rooms

9 Use station office of the ladies' rest room for first aid if necessary

10 It is advisable to ventilate wash and dressing rooms by means of ordinary cooling fans blowing out of window

11 Supply numbered paper, burlap or cloth bags for each individual's clothing, and record name and address opposite number

12 Keep contaminated clothing outside station and place bags of clothing in covered metal containers until decontaminated

13 Provide supply of clean clothing of assorted sizes in dressing room

14 Apply bleach, sodium hypochlorite solution such as chlorox or zonite, or peroxide as indicated for liquid contamination either in the disrobing or in the wash room

15 It is advisable to paint wall board, wood, concrete or brick with sodium silicate paint to prevent persistent contamination

16 Consult Office of Civilian Defense publications "Protection Against Gas" and "First Aid in the Prevention and Treatment of Chemical Casualties" for detailed instructions

Decontamination of uninjured persons may be assigned by the chief of Emergency Medical Service to the local health department Stations for decontamination of persons may be operated under the supervision of public health nurses where physicians are not available Decontamination of food and water supplies should be assigned to the local health department

JAMES M LANDIS, Director

### PLANS TO COMBAT EPIDEMICS

Surg Gen James C Magee has announced that the fifth meeting of the Army's civilian board of consultants on problems of communicable diseases has been concluded Established in January 1941 by order of the Secretary of War on recommendation of the Surgeon General, the Board for the Investigation and Control of Influenza and Other Epidemic Diseases in the Army consists of a central body of seven leaders in the fields of research on infectious diseases and epidemiology These members, all of whom were present at this meeting, are Dr Francis G Blake of Yale University School of Medicine, Dr O H Perry Pepper of the University of Pennsylvania Medical School, Dr Alphonse R Dochez of Columbia University College of Physicians and Surgeons, Dr Ernest W Goodpasture of Vanderbilt University, Dr Kenneth F Maxcy of the Johns Hopkins University School of Hygiene and Public Health, Dr Andrew J Warren of the Rockefeller Foundation and Dr Oswald T Avery of the Rockefeller Institute for Medical Research

During the past year nine commissions have been organized and put into operation under the direction of the board At the current meeting all directors of these commissions attended as follows

Dr O H Robertson, University of Chicago Medical School, Commission on Cross Infections in Hospitals

Dr M H Dawson, Columbia University College of Physicians and Surgeons, Commission on Hemolytic Streptococcal Infections

Dr Thomas Francis Jr, University of Michigan School of Public Health, Commission on Influenza

Dr Perrin H Long, Johns Hopkins University School of Medicine, Commission on Meningococcal Meningitis

Dr Colin M MacLeod, New York University College of Medicine, Commission on Pneumonia

Dr John R Paul, Yale University School of Medicine, Commission on Neurotropic Virus Diseases

Dr Wilbur Sawyer, Rockefeller Foundation, Commission on Tropical Diseases

Dr Joseph Stokes Jr, University of Pennsylvania, Commission on Measles and Mumps

Dr Stanhope Bayne-Jones, Yale University School of Medicine, Commission on Epidemiological Survey

Through the board and commissions the services of one hundred and sixteen consultants are available to the Surgeon General for advice and investigations on all problems of infectious diseases in relation to the health of the Army The board and commissions carry out their work in direct association with the Preventive Medicine Service of the Surgeon General's Office The meeting was attended also by representatives of all the services and many divisions of the Surgeon General's Office and by members of the staff of the Army Medical Center and the Army Medical Museum

### TUBERCULOSIS CASE FINDING IN DEFENSE INDUSTRIES

A photofluorographic unit for tuberculosis case finding in war industries has been assigned to North Carolina A second unit is now being prepared for service in New Jersey

Requests for the use of these units should be made through the state division of industrial hygiene to the Division of Industrial Hygiene of the National Institute of Health, Bethesda, Md A waiting list will be maintained at headquarters and requests filled in order of receipt, consideration being given to the importance and location of the industry making the request

Personnel accompanying each unit include a medical officer trained in interpreting 35 mm films, a medical technician and a clerk A portable condenser discharge x-ray machine has been added to the equipment, thus making it possible to obtain 35 mm films in the absence of 400 milhampere x-ray equipment The U S Public Health Service will maintain the equipment and furnish x-ray films and developing supplies, repairs and replacements

At the end of each survey of a particular industrial plant, a statistical and narrative report on the extent and result of the survey will be sent to the state health officer and plant medical director, after clearing the Division of Industrial Hygiene, National Institute of Health, and the States' Relations Division U S Public Health Service The films will be retained as permanent records in the Office of Tuberculosis Control of the Public Health Service

### GENERAL PERSHING AND THE BALTIC SOCIETY

Members of the Baltic Society called at the quarters of Gen John J Pershing in Washington, D C, May 28, to honor their former chief In the group were Major Gen James G Harbord, Major Gen Merritte W Ireland, former surgeon general of the Army, Major Gen Walter Bethel, Col George C Adamson and Ray T Middleton, Capt Charles B Sha and Serpts Harry Cooper and Louis A Beaman General Harbord, in presenting a walking stick to General Pershing said "As commander in chief of the American Army in France you stood like a rock for the immutable principles of war unchanging through the ages Through all the chattering gabble of postwar years your dignity has not been touched by intrigue or cheapened by futile striving You still stand as a symbol of victory and personification of constant faith"

The Baltic Society is composed of the members of the party which sailed to France with General Pershing on May twenty-five years ago

## INVESTIGATIONS OF DERMATOSES

The first meeting of the Consulting Staff of the Dermatoses Investigations Section of the National Institute of Health was held on April 20-21. Members of the staff are Dr. Paul A. O'Leary, Rochester, Minn., chairman; Dr. Samuel M. Peck, New York; Dr. S. William Becker, Chicago; Dr. Howard Fox, New York; Dr. Richard L. Sutton, Jr., Kansas City, Mo.; and Dr. Harry I. Templeton, Oakland, Calif. Dr. O'Leary was unable to be present, and Dr. Fox was selected temporary chairman. Notable among the many matters discussed by the consulting staff were the definition of a primary cutaneous irritant and the definition of a cutaneous sensitizer. The staff agreed with the plan devised by this section for testing new fabrics, finishes, dyes and cosmetics as to their possible skin irritating properties before selling them to the public. It also endorsed the plan of giving a special course on occupational dermatoses to dermatologists located in various parts of the country, so these physicians in turn can teach the subject to dermatologists in their locality and thus make available to our war industries physicians trained in occupational dermatoses. Such physicians are now badly needed to prevent and treat dermatoses—which make up approximately two thirds of all occupational diseases—among the workers in our war industries.

## GAS DEFENSE AND DECONTAMINATION COMMITTEE

Prof. W. L. Beuschlein of the chemical engineering department of the University of Washington in Seattle has been appointed chief of the decontamination service in Seattle. Professor Beuschlein first will establish a decontamination center where five hundred volunteers for this work will be trained. This number will be recruited from students and graduates of the university. Additional decontamination centers are planned for each one of the seven defense zones of Seattle.

The Plainfield, N. J. Defense Council has made appropriations for gas decontamination and casualty depots to be located on the athletic field at the high school, where the field houses will be remodeled and equipment installed to handle possible gas casualties.

Three thousand five hundred air raid wardens in Hartford, Conn., have been trained to recognize and deal with the war gases. The chairman of the Emergency Public Works Committee of the Hartford Defense Council has appointed a committee which will survey Hartford's equipment and needs in case of gas attack.

## PROTECTION OF INDUSTRIAL PLANTS AGAINST AIR RAIDS

About twelve hundred representatives of management and labor in Detroit industrial plants and factories attended an institute held at the Rackham Memorial Building, Detroit, May 21, and were expected to meet twice a week for the following three weeks under the sponsorship of the Detroit Industrial Safety Council in cooperation with the Office of Civilian Defense. The purpose of the instruction was to outline a practical operating plan to protect industrial plants against possible air raids. The city health commissioner, Dr. Bruce H. Douglas, Lieut. Bernard A. Preo, bomb specialist of the police department, A. S. Moreau, director of the Detroit chapter of Red Cross, and Edwin C. Denstaedt, communications controller of the Office of Civilian Defense, were among the speakers.

## SOUND FILMS ON THE EMERGENCY MEDICAL SERVICES

A series of sound slide films on the emergency medical services is being developed by the medical division of the Office of Civilian Defense and when completed will be shown throughout the country and used as illustrative material for lectures on emergency medical techniques. The films are being made at Mount Vernon, N. Y., where with the cooperation of various officials the workings of the Mount Vernon emergency medical services is being filmed.

## LONG BEACH INSTRUCTS FORTY THOUSAND IN AIR RAID PRECAUTIONS

A three day educational program in the form of a play entitled "It May Happen Here," enacted by volunteer members of the Emergency Medical Service and the Community Players, was presented in May at the Long Beach Municipal Auditorium and was attended by more than forty thousand persons. Doctors, nurses and Red Cross personnel acted out the training program under conditions simulating air raids. The program on medical preparedness was arranged by Dr. Robert W. Wilcox, chief of the Emergency Medical Service for Long Beach and the exhibits in various fields of civilian war effort were demonstrated under the arrangements of Dr. Fred B. Clarke. Stanley K. Cochems, who wrote and directed the play, was master of ceremonies and was borrowed from the Los Angeles County Medical Association to put on the play.

## EMERGENCY MEDICAL FIELD SETS

At the recent annual meeting of the Medical Society of the State of New York in New York City, the medical director of the Medical and Surgical Relief Committee of America, Dr. Joseph P. Hoguet, presented an emergency medical field set to the research director of the New York State Health Preparedness Commission, Dr. John J. Bourke, who turned it over to Dr. Louis Bauer, chief of emergency medical services of the Nassau County War Council, for use at Mitchell Field. The Medical and Surgical Relief Committee aims to carry on a nationwide drive to provide sufficient emergency medical field sets to the medical directors of civilian defense areas throughout the country. Each emergency set contains two portable cases completely equipped with instruments and supplies in accordance with specifications of the Office of Civilian Defense. The sets are to be placed in first aid posts and hospitals, from which they can be readily carried to points of disaster.

## TRAINING IN CHEMICAL WARFARE AND GAS PROTECTION

The New York State Health Preparedness Commission, following meetings at the New York Academy of Medicine, has formulated a program of instruction which will be available to all physicians in the state for training in the medical aspects of chemical warfare and gas protection techniques. The chairman of the Health Preparedness Commission has appointed Dr. David D. Rutstein, chief of the Cardiac Bureau of the State Department of Health, as deputy medical officer for gas protection in the emergency medical services. Physicians who have taken the courses will then instruct other physicians throughout the state.

## PLANS TO PREVENT SABOTAGE OF WATER SUPPLIES

Every city and village in Wisconsin was invited to send representatives to a special water works school to be conducted at the University of Wisconsin, May 12-13, for instruction in the prevention of sabotage in making emergency repairs of damage resulting from enemy action. The course was arranged by the Wisconsin State Board of Health, the Wisconsin section of the American Water Works Association, the League of Municipalities and the university.

## CHECK ON EFFECTS OF ARMY TRAINING

The War Department announced on May 25 that about twenty thousand enlisted men will be retested to determine the effect of training on a soldier's score in the general classification test. This test, which is given to every man on induction into the service, is designed to test his ability to learn and not his educational background. Its chief object is to serve as a guide to classification officers in assigning men to work and organizations for which they are best qualified. About five thousand of the enlisted men will be retested at replacement training centers prior to their assignment with field forces. This will afford a check on the effect of training given at replacement training centers.

# ORGANIZATION SECTION

## WOMAN'S AUXILIARY

### California

At the February meeting of the Alameda County auxiliary Miss Beatrice Carpenter of the California Dairy Council spoke on nutrition. Carol Mills, violinist, played several solos. Heretofore auxiliary members have been working in the various departments of the Red Cross. The auxiliary now has several of its own units. Sixty members are in the first aid class, which is under the instruction of Drs Dorothy M Allen and Helen Snook. A Red Cross sewing unit, with twenty members, is sewing one day a week under the direction of Mrs Kenneth Neilson and Mrs W W Cross.

In January, Capt M D Willcutts, M C, of the Naval Hospital, addressed the San Diego auxiliary on the blood bank. The auxiliary is working with the San Diego Medical Association in establishing a blood bank in San Diego for civilian defense. Mr Quon, Chinese lecturer, spoke on "America's Position in the Pacific." He ended his talk with a reading of the new Chinese national anthem.

Nearly all the membership of the San Francisco auxiliary is engaged in some activity with national defense. On Christmas day many members did valiant work when many evacuees reached San Francisco. They spent hours on the docks waiting to transport people to hotels, hospitals and the various clubs which had facilities to receive them. Many of the members are taking instruction in first aid and attending nutrition classes, while others in the mobile canteen go out in station wagons to feed soldiers who are guarding different parts of the city.

Members of the San Francisco auxiliary recently responded 100 per cent in entertaining men in the service at the San Francisco Hospitality House. At least one thousand men were served sandwiches, doughnuts and coffee. In the afternoon, daughters of members acted as junior hostesses and helped to entertain by dancing and playing cards. In the evening the girls from the training schools of Stanford and of the University of California acted as hostesses. Proceeds from a previous bridge party were sent to the California and Stanford universities as a loan fund for senior medical students.

### Delaware

Mrs Erwin L Stambaugh of Lewes was elected president of the woman's auxiliary to the Medical Society of Delaware at the annual meeting recently and assumed office on Jan 1, 1942 for a two year term. Other officers elected are vice president for New Castle County, Mrs George C McElfatrick, vice president for Kent County, Mrs I W Mayerberg of Dover, vice president for Sussex County, Mrs James Beebe of Lewes, recording secretary, Mrs Sylvester W Rennie of Wilmington, corresponding secretary, Mrs Lawrence Fitchett of Milford, treasurer, Mrs Albert J Strikol of Wilmington.

### Indiana

Forty-six hundred people heard Dr W W Bauer, director of the A M A Bureau of Health Education, during his lectures in Fort Wayne recently, sponsored by the woman's auxiliary to the Allen County Medical Society. "Popular Beliefs That Are Not So" was the subject of his lectures to the pupils of the three public high schools, and at the regular meeting his topic was "The Doctor's Wife." The evening meeting was preceded by a dinner given in the Old Fort Room at the Indiana Hotel, at which time Dr Bauer spoke to the guests who were members of the auxiliary board of directors and their husbands, the physicians of the auxiliary advisory council and the executive board of the Fort Wayne Medical Society and their wives.

The Lake County auxiliary has decided to do Red Cross sewing every other Tuesday in the home, with two members acting as hostesses.

Miss Mary Sinclair, assistant director of woman's activities for the Indiana Defense Council, talked on "Women in Defense" before the Marion County auxiliary in January.

The Porter County auxiliary met in Valparaiso on January 27, Mrs G R Douglas talked on "The Philippines."

In January the Vigo County auxiliary held the annual guest dinner in the Student Union Building of the State Teachers College. Dr Hazel Pfennig talked on her trip to South America.

### Kansas

The Woman's Auxiliary to the Sedgwick County Medical Society voted to cancel the February guest day tea and substitute a war relief donation of \$25 to the Red Cross as a part of the auxiliary program. Plans for organizing a Red Cross unit within the auxiliary are being considered. Mrs W J Kiser, Hygeia chairman, announced that more than one hundred subscriptions had been placed.

### Mississippi

At the December meeting of the Northeast Mississippi Thirteen Counties Auxiliary, at which Dr and Mrs Henry Boswell were guest speakers, the members made a contribution to the work of the preventorium. The meeting was held at the home of Mrs V B Philpot of Houston. Mrs Boswell spoke on "Objectives and Its Accomplishments of the Auxiliary" and Dr Boswell on "What the Auxiliary Means to Doctors and Some of the Capacities in Which It Can Serve."

### New Jersey

The Atlantic County's new welfare project is to aid financially a student nurse in the training school of the Atlantic City Hospital. In March 1942 candidates' names from the various high schools will be submitted to the Nurses Committee which will give each candidate consideration and in June, on graduation from high school, the student will be selected. The student will enter the training school in September 1942. The stipulated amount to be lent the candidate is \$200 for her three year period of training. A gift of \$25 will be given the nurse by the auxiliary on her graduation from the training school. The Medical Preparedness Committee has been actively engaged in collecting instruments, drugs and samples and in assisting physicians.

To assure sufficient funds to pay the tuition and maintenance of the student nurse whom the Burlington County auxiliary sends through training school (Burlington was the first county in New Jersey to do this), every member has been urged to guarantee a \$4 table at a large card party. The auxiliary is making and sending thousands of cookies to Fort Dix each week, and many members of the auxiliary serve as hostesses at the fort.

### West Virginia

The McDowell County auxiliary met on February 12 at Welch. Mrs H P Evans, president, presided. Mr Joe Swane discussed the method being used to assign doctors for service with the armed forces.

The Parkersburg County auxiliary met on January 13 at Mrs A C Wooster, presiding. Miss Frances Inslee reviewed Victor Heiser's book "You're the Doctor." Mrs James I Wade discussed procurement and assignment service for the medical profession. At the auxiliary meeting, February 10, Margaret Joseph, dietitian for St Joseph's Hospital, spoke on "Diet in Defense and the Mobile Kitchen." Going "all out for defense," auxiliary members plan no more luncheon sessions during the duration. Members contributed books for the victory book drive and voted to give ten subscriptions to Hygeia to the schools of the county.

## Medical News

(PHYSICIANS WILL CONFERR A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS CENTRAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

### ARKANSAS

**State Medical Election**—Dr Samuel J. Allbright Searcy was named president-elect of the Arkansas Medical Society at its recent annual session in Hot Springs National Park. Dr Rufus B. Robins Camden, was inducted into the presidency and Dr William R. Brookshire Fort Smith was reelected secretary. The next annual meeting will be in Little Rock, the dates to be determined later.

**District Meetings**—The North East Arkansas Medical Society was addressed at Tyronza May 7 among others, by Drs William H. Anderson, Booneville, Miss on Problems and Progress in Medicine', Henry King Wade, Hot Springs, 'Psychiatry', Charles H. Lutterloh Hot Springs 'Problems of Arthritis', Francis W. Carruthers Little Rock 'Treatment of Fractures of the Forearm', and Silas C. Fulmer Little Rock, 'Clinical Syndromes of Coronary Artery Disease'. At a meeting of the Second District Medical Society in Searcy, April 13, Drs Henry E. Mobley Morrilton and John N. Compton Little Rock spoke on 'Surgical Emergencies' and 'Generalized Diagnosis' respectively.

### CALIFORNIA

**Physicians Wanted**—The Los Angeles County Civil Service Commission announces positions open as physician and assistant physician at Olive View Sanatorium San Fernando. To be eligible an applicant should be between 21 and 55 years of age, a graduate of an approved medical school who has completed one year internship in an approved hospital. Applications should be filed on or before June 16.

**Society News**—The Alameda County Medical Association was addressed, May 18 by Drs Edward G. Ewer on 'The Treatment of Femoral Neck Fractures by Nailing', Douglas D. Dickson, 'Ankle Fractures' and Leonard B. Barnard 'Advances in the Treatment of Poliomyelitis'. All are of Oakland.—Dr Lawrence K. Gundrum Los Angeles discussed 'Effect of the Newer Sulfonamides on the Nasal Mucosa of Rabbits' before the San Diego County Medical Society, May 12.

**Personal**—The University of California recently conferred the honorary degree of LL.D. on Dr Langley Porter dean emeritus of the university's school of medicine San Francisco.—Dr John H. Lawrence, assistant professor of medicine, University of California Medical School Berkeley, has been awarded an honorary degree of doctor of science at the University of South Dakota Vermillion, for 'successful therapeutic use of radioactive phosphorus to produce remissions in leukemia in man and for his development of the medical applications of neutrons and artificially radioactive elements'.

**Dr Legge Retires as Professor of Hygiene**—Dr Robert T. Legge announces his retirement as professor and chairman of the department of hygiene at the University of California, Berkeley, with the title professor emeritus after twenty-eight years' service at the university. Dr Legge was born in San Francisco in 1872. He received his degree in medicine at California in 1899 and joined the university faculty in 1915. Dr Legge is also lecturer on industrial medicine at the University of California Medical School in San Francisco and director of the Ernest V. Cowell Memorial Hospital at the university, Berkeley. He is a member of the Council on Industrial Health of the American Medical Association.

### DISTRICT OF COLUMBIA

**District Society Election**—Dr Fred R. Sanderson was chosen president-elect of the Medical Society of the District of Columbia at its meeting May 6. He will take office on July 1, 1943. Dr Andrew Magruder MacDonald district coroner will take office as president of the society on July 1. Other officers chosen to take office this coming July are Drs Thomas S. Lee and Alma J. Speer, vice presidents.

**Personal**—Watson Davis, director of Science Service, was presented with the award of the American College Publicity Association at its meeting, May 9. According to *Science* Mr. Davis was cited for his 'Years of faithful interpretation of

research in science and its translation into terms understandable to the reading public with no loss of dignity or essential meaning'.—Dr George W. Creswell has been appointed a special consultant in the division of venereal diseases, U. S. Public Health Service.

### IDAHO

**Society News**—Dr George W. Holmes, Boston, addressed the Southwestern Idaho Medical Society recently in Boise on 'Obstructive Lesions of the Bronchi'.—Dr Richard P. Howard, Pocatello presented a review of ulcerative colitis before the Pocatello Medical Society, April 2, and Dr Carroll W. Dewey, Fort Hall, presented a patient aged 10 years with interstitial emphysema.

**Annual Registration Due July 1**—All practitioners of medicine and surgery holding licenses to practice in Idaho are required by law to register annually, on July 1 with the Department of Law Enforcement and at that time to pay a fee of \$2. If a licensee has not paid the annual registration fee by October 1 his license can be canceled but will be restored within five years thereafter on payment of the delinquent fees and a \$10 penalty. If a license has been canceled for more than five years it can be reinstated only on the payment of \$25 and on the licensee's passing an examination the nature of which shall be determined by the Department of Law Enforcement.

### ILLINOIS

**Physician Cited for Bravery in Java**—Major Leon E. Robinson Aledo now stationed with the medical staff of the headquarters, U. S. Army forces in Australia, has been cited for outstanding performance of duty under fire in the campaign in Java, newspapers reported on May 20. The citation from Col. E. L. Eubank of the army air corps, commended Major Robinson for his 'splendid performance of duty while serving as senior medical officer of the nineteenth Bombardment group during the recent campaign in Java'.

**Changes in Hospital Superintendents**—Dr Edward F. Ross, managing officer of Alton State Hospital, Alton has been named to a similar position at the Manteno State Hospital, Manteno succeeding Dr. Walter H. Baer, who resigned to enter military service. Dr. Alfred P. Bay, assistant managing officer of Alton, has been named in charge. Dr. Edward A. Welch chief medical officer of the Veterans Administration Facility at Excelsior Springs, Mo., has been placed in charge of the new \$1,500,000 veterans' hospital near Marion.

### Chicago

**Dr. Newton Named Chairman of Chemical Section**—Roy C. Newton, Ph.D., vice president in charge of the research laboratories of Swift & Company has been elected chairman of the Chicago Section of the American Chemical Society. He will assume the position July 1. Dr. Newton received his degree of doctor in philosophy at the University of Chicago in 1924. He has been with Swift & Company since 1924.

**The Jessie Horton Koessler Fellowship**—The Jessie Horton Koessler Fellowship of the Institute of Medicine of Chicago for the aid of research in biochemistry, physiology, bacteriology or pathology will be available on September 1. The stipend is \$500 a year with the possibility of renewal for one or two years. Only such applications will be considered as are approved by the head of a department in the fields mentioned or by the director of a research institute or laboratory in Chicago and which stipulate that the recipient of the fellowship shall be given adequate facilities for carrying out the proposed research concerning which full information is required in the application. Applications will be received up to July 1 and should be sent to Dr. H. Gideon Wells, 950 East 59th Street, chairman of the committee on the Jessie Horton Koessler Fund. Since there are no formal blanks, application should be made by letter.

**Blood Grouping Tests Upheld in Illinois Paternity Case**—On March 15 newspapers reported the annulment of a marriage on evidence of blood tests that excluded the husband as the father of his wife's child. The annulment was granted to the husband on the ground of fraud, the judge holding that the young man was wrongfully induced to marry his wife on her claim that he was the father of her child now 1 year old. The newspaper stated that the case is the first in Illinois in which a court has voided a marriage on complaint of paternity fraud, with blood tests serving as proof. With the consent of attorneys Judge Harrington appointed Drs. Josiah J. Moore and Benjamin H. Neiman to make blood tests. Both physicians indicated in their reports that the husband in the case

could not be the father of the child. Included among the states that have passed legislation recognizing blood grouping tests for paternity are New York, Wisconsin, Maine, Ohio and New Jersey.

### INDIANA

**New District Health Unit**—Dr. John D. Winebiennner, Princeton, has been named director of the newly created district health department number five, with offices in Columbus. The district includes Bartholomew, Johnson, Shelby, Jackson and Decatur counties.

**Physician Interned by Japanese**—The St. Louis County Red Cross has been notified that Dr. Lawton E. Shank, Angola, has been interned by the Tokyo government, newspapers reported on May 18. Dr. Shank, who is said to have been on Wake Island when the Japanese attacked, graduated at the Indiana University School of Medicine, Indianapolis, in 1938.

**Personal**—Dr. Henry Vernon Madsen, Richmond, has been appointed superintendent of Smith-Esteb Memorial Hospital, Richmond, succeeding the late Dr. James R. Cooper. Dr. Paul D. Williams, assistant superintendent of the Logansport State Hospital, has been appointed medical superintendent of the Richmond State Hospital, effective April 1. He succeeds Dr. Paul S. Johnson, who resigned to enter private practice.

### IOWA

**Spotted Fever Vaccine Available**—The Rocky Mountain Laboratory of the U. S. Public Health Service, Hamilton, Mont., has given the Iowa State Department of Health, Des Moines, a supply of spotted fever vaccine, prepared from the chick embryo by the method of Herald R. Cox, Sc.D., Hamilton. Vaccine for active immunization of children and adults at the Tama Indian Reservation was forwarded by the state department of health and administered by Drs. Ira D. Nelson and Arthur A. Pace of the Indian Service at Toledo. The department is prepared to furnish vaccine free of charge in response to requests from physicians for immunization of persons subject to frequent exposure to the common dog tick.

### KANSAS

**Society Appoints Executive Secretary**—Mr. R. W. Callahan, who has been assisting the Shawnee County Medical Society in its medical care program for the indigent, has been appointed executive secretary for the society with offices at 311 National Reserve Building, Topeka.

**Changes in Health Personnel**—Dr. Donald E. Bux, Manhattan, has been appointed full time health officer of Cherokee County, with offices in Columbus, succeeding Dr. Joseph W. Spearing, who resigned to become medical director of the Kansas Ordnance Plant at Parsons.

**Institute for Psychoanalytic Training**—The Topeka Psychoanalytic Society will establish a Psychoanalytic Training Institute, according to the Bulletin of the Shawnee County Medical Society. Approval of the proposed institute was given by the American Psychoanalytic Association at its meeting in Boston recently.

**New State Health Officer**—Dr. Floyd C. Beelman has been appointed secretary and executive officer of the state health department of Kansas, according to the *Register* for April 15. He succeeds Dr. Fred P. Helm, who has been doing post-graduate work at Johns Hopkins University, Baltimore, under a leave of absence. Dr. Beelman had been serving as acting secretary until the recent appointment.

### KENTUCKY

**State Board Activities**—A \$125,000 three story addition to the state board of health will soon be started, newspapers reported on May 7. It is hoped that the structure will be completed by October. Plans have also been announced for the expansion of the state bureau of industrial hygiene providing for additional personnel and laboratory equipment.

**Changes in Health Officers**—Dr. Paul Q. Peterson, Hardinsburg, has been transferred from his position as health officer of Hancock County to a similar position in Warren County. Dr. Everett A. King, formerly of Fort Wayne, Ind., captain, U. S. Public Health Service, has taken over the work of the health officer in the Tri-County Unit composed of Hancock, Breckenridge and Meade counties. Dr. Peterson will succeed Dr. Lewis Fine, Bowling Green, who is retiring from the work because of ill health. Dr. Nicholas A. James, Tell City, Ind., is the new health officer of Perry County, it is reported.

### MAINE

**Annual Meeting of Medico-Legal Society**—The Maine Medico-Legal Society will hold its annual meeting at the Poland Spring House, Poland Spring, June 23. One session will be devoted to a discussion of legal angles of the medical examiner system. Dr. Joseph E. Porter, Portland, will address the meeting on "Medicolegal Aspects of Coronary Occlusion" and Dr. Alan R. Moritz, Boston, will discuss "Forensic Pathology."

### MARYLAND

**State Medical Election**—Dr. Charles R. Austrian, Baltimore, was elected president of the Medical and Chirurgical Faculty of Maryland at its meeting in Baltimore on April 29. He will be inducted into office on January 1. The next annual session will be held in Baltimore, April 27-28, 1943.

**Annual Health Conference**—The twenty-second annual health conference of the state department of health was held at the Longfellow Hotel, Baltimore, May 15-16. Included among the speakers were Dr. Allen W. Freeman, "A Public Health Program in Wartime" and Miss Marjorie M. Heseltine, consultant in nutrition, U. S. Children's Bureau, Washington, D. C., "Nutrition in Wartime." One session was devoted to a symposium on venereal diseases with the following Baltimore physicians:

Dr. Joseph Earle Moore, consultant in venereal diseases, state department of health.

Dr. Ferdinand O. W. Reinhard, director of the bureau of venereal diseases, Baltimore City Health Department.

Dr. Nels A. Nelson, deputy state health officer, state health department.

Dr. Edgar W. Norris Jr., surgeon, U. S. Public Health Service liaison officer, Third Corps Area, U. S. Army.

Dr. Albert F. Doyle, venereal disease control officer, Third Corps Area U. S. Army.

Dr. Thomas B. Turner, professor of bacteriology, Johns Hopkins School of Hygiene and Public Health.

There was also a round table discussion on the public health nurse as a teacher of home nursing on Saturday morning, May 16.

### MASSACHUSETTS

**Dr. René Dubos Appointed Professor at Harvard**—Rene Jules Dubos, Ph.D., member of the Rockefeller Institute for Medical Research, New York, has been appointed George Fabyan professor of comparative pathology and professor of tropical medicine at Harvard Medical School, Boston. He succeeds Dr. Ernest E. Tyzzer, who becomes professor emeritus. Dr. Dubos was born in France in 1901. He studied at the Institut National Agronomique, Paris, 1919-1921. He came to the United States in 1927 and became a naturalized citizen in 1938. He was instructor in bacteriology at Rutgers University, New Brunswick, N. J., from 1925 to 1927, when he became assistant at the Rockefeller Institute for Medical Research, serving there in this capacity until 1930. He was associate at the institute from 1930 to 1938 and associate member from 1938 to 1941 when he became a member. In 1940 Dr. Dubos received the John Phillips Memorial Award of the American College of Physicians and in 1941 the Mead Johnson Award of the American Academy of Pediatrics, in recognition of his development of gramicidin. Dr. Tyzzer graduated at Harvard in 1902 and joined the faculty the following year.

### MINNESOTA

**Institute for Human Genetics**—The Charles Fremont Dight Institute for the Promotion of Human Genetics is now in operation at the University of Minnesota, Minneapolis, according to the *Bulletin* of the Hennepin County Medical Society. Clarence P. Oliver, Ph.D., of the department of zoology, is in charge. Under the will of the late Dr. Dight the income of a fund of more than \$100,000 was bequeathed to the university to endow the institute. Studies will be directed particularly at present to "a search for traits, such as metabolic disturbances, which may have genetic bases but are recognized as hereditary traits." Dr. Dight once served on the staff of the University of Minnesota Medical School.

### MISSOURI

**State Medical Election**—Dr. Andrew W. McAlester Jr., Kansas City, was chosen president-elect of the Missouri State Medical Association during its annual meeting in Kansas City, April 27-29, and Dr. Homer L. Kerr, Crane, was installed president. Mr. E. H. Bartelsmeyer, St. Louis, is expected to be secretary of the association. The next annual session will be in St. Louis.

## NEW JERSEY

**Aurora Institute Lectures**—Dr George T Pack, New York delivered the first of the 1942 medical lectures sponsored by the Aurora Institute, Morristown, May 24, on 'Problems in Cancer Surgery'

**State Medical Election**—Dr Ralph H Hollmshed, Westville was named president-elect of the Medical Society of New Jersey at its annual meeting in Atlantic City in April. Dr Elms J Marsh Paterson, who was inducted into the presidency, is the third physician with this name to head the society. His father was president in 1891 and his grandfather in 1850. Dr Alfred Stahl, Newark, is the secretary of the society.

**Medical-Surgical Plan Approved**—The board of trustees of the state medical society has approved the organization of the Medical-Surgical Plan of New Jersey, to supersede plan number 2 of Medical Service Administration. The purpose of the plan will be to provide payment for eligible medical and surgical services rendered by fully licensed physicians to persons admitted as bed patients in approved hospitals. The plan will operate under an agreement with Hospital Service Plan of New Jersey, by which the physical work of administration will be performed by existing facilities of the Hospital Plan without profit to the latter. Matters relating to professional services, patient-physician relationship, payment of physicians services and other administrative details will be performed by the administrative personnel of Medical-Surgical Plan. The new project will be operated as a separate corporation from Medical Service Administration. The subscription rate will be 75 cents for each subscriber and \$2 for each family a month with certain limitation on the amount of services eligible for payment. The plan will not operate in any county of the state unless 51 per cent of the physicians participate.

## NEW YORK

**School Physicians Conference**—The New York State Association of School Physicians will hold its annual meeting and conference on June 22 at the Grand Union Hotel Saratoga Springs. The program has been arranged to interest school physicians, nurses, dental hygienists, health officers and general practitioners of medicine.

**Rabies in a Horse**—For the first time rabies in a horse has been reported to the state health department, according to a release of May 24. The horse became ill in his stable at a race track in Nassau County and bit its groom on the arm. The animal developed partial paralysis, tremors and staggering and was ordered destroyed. The horse's head was sent to the state laboratory, which later confirmed the diagnosis of rabies. The horse had come from a ranch in Texas and had been trained at Columbia, S C. It had raced in Florida and was later sent back to Columbia for further training. From there it was taken by rail to a race track in Nassau County. There were eighteen known contacts to the horse. The animal was said to have been under careful supervision, and no history could be obtained of its having been bitten by a dog or having been in contact with any rabid animal while in Nassau County. According to the state department of health, animal rabies had been prevalent in the vicinity of the Columbia stables where the horse had been in training.

## New York City

**Dr Jean Curran Chosen President of Long Island College**—Dr Jean A Curran, since 1937 dean of the Long Island College of Medicine, Brooklyn, has been elected president of the school. He fills the vacancy that occurred when Dr Frank Babbott, president since 1931, resigned last fall because of ill health. Since then he had been acting president.

**Retirements at Columbia**—The retirement of the following members of the faculty at Columbia University has been announced. James H McGregor, Ph D, since 1924 professor of zoology and a staff member since 1897. Dr Horatio B Williams, Dalton professor of physiology since 1922 and a member of the faculty since 1911, and Ernest L Scott, Ph D, since 1922 associate professor of physiology and a member of the staff since 1912.

**New Unit at Home for Incurables**—A new \$250,000 building was recently completed at the Beth Abraham Home for Incurables. The new unit considered the hospital wing of the home and offers accommodations for 62 additional patients as well as the following services: surgery, x-ray, electrocardiograph, laboratory and dental treatment, physical therapy and hydrotherapy. The original four story building cared for 256 incurable men and women of all types.

**Dr Loeb Named First Lambert Professor of Medicine**—Dr Robert F Loeb, professor of medicine, Columbia University College of Physicians and Surgeons, has been named Lambert professor of medicine at the school. Dr Loeb is the first incumbent of the chair, which was established in honor of Dr Samuel Waldron Lambert, dean of the school from 1904 to 1919, who died on February 9. A native of Chicago, Dr Loeb graduated at Harvard Medical School in 1919. He is 47 years of age.

**Lectures in Honor of Dr Schick**—A fund has been given to Mount Sinai Hospital to inaugurate a series of lectures in honor of Dr Bela Schick, who has retired after serving as pediatrician in chief at the hospital. The fund to finance the lectures was contributed by friends and associates. Dr Schick was born in Boglar, Hungary, in 1877. He received his degree in medicine at the Karl Franz University, Graz, Germany, in 1900. He practiced in Vienna and served as professor of pediatrics until 1923, when he came to the United States. He became a naturalized citizen in 1929. In 1913 he discovered the "Shick test" for determining susceptibility to diphtheria. He has received many awards. Dr Schick is now consultant to Mount Sinai Hospital.

## NORTH DAKOTA

**Personal**—Dr Paul T Cook has been made district health officer of six counties with headquarters in Valley City, succeeding Dr Robert G White, Valley City, who has been transferred to Bismarck, according to the *Journal-Lancet*.

**Meeting of Ophthalmologists**—Dr Gustaf A Larson, Fargo, was chosen president of the North Dakota Academy of Ophthalmology and Otolaryngology at its annual meeting in Jamestown May 19. Other officers are Drs Tracy W Buckingham, Bismarck, vice president, and Frederick L Wicks, Valley City, secretary-treasurer. Re-elected Dr Lawrence R Boies, Minneapolis, addressed the meeting on "The Problem of Deafness."

## OHIO

**State Medical Election**—Dr Clifford C Sheehurne, Columbus, was chosen president-elect of the Ohio State Medical Association at its meeting in Columbus, April 2 and Dr Edward J McCormick, Toledo, was inducted into the presidency. The next annual session will be in Toledo, the date to be announced later.

**Latin American Physician Awarded Fellowship**—Dr Leopoldo Luis Benedetti B, Panama, has been awarded a fellowship in pediatrics by the American Academy of Pediatrics, the training to be carried out at the University of Cincinnati College of Medicine. Dr Benedetti graduated at Georgetown University School of Medicine Washington D C, in 1936 and has recently been working for the Public Health Service of Panama.

**Conservation Conference**—"Our Health Depends on Our Soil" will be the theme of a conference on conservation nutrition and human health presented as a featured event of the Conservation Laboratory at Tar Hollow Camp near Chillicothe, June 27-28. The program arranged by Dr Jonathan Forman, Columbus, director general of the International Correspondence Club of Allergy, will consist of the following:

Wilbur Stout B E Columbus Water the Life Blood of Ohio  
William A Albrecht Ph D Columbia Mo The Nutrient Quality of the Soil  
Kenneth C Beeson Nutrient Quality of Plants and Its Relation to Soil and Animals  
Paul B Sears Ph D Oberlin Influence of Ohio's Climate on Plant Life  
Dr Clarence A Mills Cincinnati Influence of Ohio's Climate on Human Health  
Dr Forman Hidden Hunger in Man

The Conservation Laboratory is jointly sponsored by the department of education of the state of Ohio, the division of conservation and natural resources of the state of Ohio and Ohio State University, Columbus.

## OKLAHOMA

**Isolation Unit for University Hospital**—The Federal Works Agency has recently allotted \$125,000 to the University of Oklahoma School of Medicine Oklahoma City, to erect an isolation building adjacent to the University and Crippled Children's hospitals on the campus at Oklahoma City. The sum will cover the cost of building and equipment.

**State Medical Election**—Dr James Stevenson, Tulsa, was chosen president-elect of the Oklahoma State Medical Association at its annual meeting in Tulsa, April 23, and Dr James D Osborn Jr, Frederick, was installed as president. Dr Galvin L Johnson, Pauls Valley, was chosen vice president. Dr Lewis J Moorman, Oklahoma City, is secretary. The 1943 session will be in Oklahoma City.

## PENNSYLVANIA

**Half Century of Milk Sanitation**—The completion of fifty years in milk sanitation was observed at a meeting in Pittsburgh, May 14, by the Pennsylvania Public Health Association in cooperation with the Pennsylvania Association of Dairy Sanitarians and the Tri-State Food and Health Officials. The program reviewed the start of the bacteriologic control of milk quality in this country through the laboratory work done in Boston by the late Dr William T Sedgwick and his associates and recalled that in 1892 a paper by Sedgwick and Batchelder on "A Bacterial Examination of the Boston Milk Supply" was published in the *Boston Medical and Surgical Journal* and that in the following year the late Dr Henry L. Coit began his "memorable work on certified milk," and pasteurized milk stations were established in New York City by Nathan Straus. As a result of papers presented at the anniversary meeting, the Pennsylvania Public Health Association at its regular annual meeting on May 14 adopted a series of resolutions acknowledging Sedgwick's contributions to public health and urging the continued pasteurization of milk and the control of raw milk as a public health measure.

## Philadelphia

**Pathologist Given Strittmatter Award**—DaCosta Oration—Dr Joseph McFarland, emeritus professor of pathology, University of Pennsylvania School of Medicine, was presented with the 1941 Strittmatter Award of the Philadelphia County Medical Society on May 7. The award, which consists of a scroll describing the accomplishments of the recipient and a gold medal, was presented by Dr Jacob Parsons Schaeffer, chairman of the society's committee on the Strittmatter Award. Dr William Wayne Babcock, professor of surgery and clinical surgery, Temple University School of Medicine, delivered the annual DaCosta Oration before the society on "The Life of a Surgeon."

**Annual Postgraduate Lectures**—The Ninth Annual Postgraduate Clinical Lectures given under the auspices of the attending staff of Mercy Hospital and the school for nurses were offered May 18-22 by

Dr William D Stroud Effort Syndrome

Dr Clyde H Kelehner, Allentown, Pa, Nonarticular Rheumatism and Its Treatment

Dr Donald Guthrie, Sayre Pa. Diagnosis of the Diseases of the Thyroid with Special Reference to the Treatment of Different Cases

Dr William Bates, Abdominal Emergencies with Regard to the General Practitioner

Brook J Masuda, D D S, Acute Infections, Traumatic Injuries and Surgery of the Head and Neck

Dr Harrison F Flippin, Factors Responsible for Successful Sulfonamide Therapy

## TEXAS

**Brinkley Dies**—Dr John R Brinkley, "goat gland" specialist, died May 26 at a hospital in San Antonio. Newspapers report that he had been under treatment for a heart ailment since the amputation of a leg in Kansas City, Mo, last winter. He was 56 years of age.

**Study Courses**—The Dallas Southern Clinical Society announces a series of summer courses for the continuation of medical study to be held in Dallas June 22-24, covering cardiovascular disease, dermatology, fractures and obstetrics. Additional information may be obtained from the secretary of the society at 1133 Medical Arts Building.

**Tuberculosis Study at San Antonio**—The U S Public Health Service recently conducted a tuberculosis survey in San Antonio at the request of city officials and its health officer Dr William A King. Suspects between the ages of 12 and 50 were examined at various centers. A feature of the study was the use of a new 35 mm camera, with which it was estimated that some thirty thousand roentgenograms would be made. The staff sent by the public health service included a physician, technician, secretary and several employees, according to the state medical journal.

## WASHINGTON

**Annual Registration Due July 1**—All practitioners of medicine and surgery holding licenses to practice in Washington are required by law to register annually on or before July 1 with the director of licenses and at that time to pay a fee of \$5, thereby renewing their licenses for one year. Failure on the part of a licensee timely to register and pay the required fee renders his license to practice invalid, but his license may be reinstated on written application to the director and on payment of the delinquent fees and a penalty of \$10.

**Society News**—The King County Medical Society devoted its meeting, May 4, to a panel discussion on therapy selection for cancer in various parts of the body, the speakers were Drs Donald V Trueblood, Charles B Ward, Simeon T Cantel, Paul R Rollins and Erroll W Rawson, Seattle.—Dr Leon A Goldsmith, Portland, Ore, addressed the Walla Walla Valley Medical Society, Walla Walla, April 9, on "The Heart in Pregnancy"—Dr Frederick Lemere, Seattle, discussed "The Conditioned Reflex Treatment of Alcoholism" before the Multnomah County Medical Society in Portland, May 6.

## GENERAL

**American Physiotherapy Association**—The twenty first annual conference of the American Physiotherapy Association will be held at College Camp, Williams Bay on Lake Geneva Wis, June 28 to July 3. The program will be devoted to discussions on the treatment of war injuries and anterior poliomyelitis. A short course in applied anatomy is also included. The association also announced a graduate program in physical therapy at Northwestern University Medical School, Chicago, July 6 to 24.

**Association of Neoplastic Diseases**—The summer meeting of the American Association for the Study of Neoplastic Diseases will be held at the University Hospital, Baltimore, June 25-27, under the presidency of Dr Julian L Rawls, Norfolk, Va. Wilson C Grant, M S, and John C Krantz Jr, Ph D, Baltimore, will discuss "Effect of Certain Substituted Ureas on Enzyme Systems of Walker Sarcoma 319." Two sessions will be devoted to microscopic pathology and one to tumors of the lung. Physicians are asked to bring their microscopes.

**Planned Parenthood**—The Tennessee and Florida state medical associations adopted resolutions at their recent annual meetings approving the furnishing to women by physicians of information on family planning. This action brings the total to six states that have now adopted resolutions endorsing the dissemination of family planning advice by physicians. According to an announcement from Dr Claude C Pierce, medical director of the Planned Parenthood Federation of America Inc, New York, three states have been providing family planning information to the indigent in health department clinics with the approval of the local county medical society.

**Sight-Saving Classes**—The National Society for the Prevention of Blindness, Inc, New York, announces a group of sight-saving classes to train teachers and supervisors to be conducted at the following universities in cooperation with the national society: Peabody College for Teachers, Nashville, Tenn, June 22-August 1, Wayne University, Detroit, June 29-August 7, State Teachers College, Buffalo, June 29-August 7 and Teachers College, Columbia University, New York, July 6-August 14. The courses will interest teachers of special classes for the education of children with seriously defective vision and will help nurses and social workers in conserving the sight of children in their care.

**Harvey Cushing Society**—Dr Eric Oldberg, Chicago, was chosen president of the Harvey Cushing Society during its meeting in New York, May 18-20. Dr Francis D Ingraham, Boston, is vice president and Dr Louise Eisenhardt, New Haven, Conn, secretary-treasurer. Among the speakers at the meeting were Drs Lawrence S Kubie and Sydney G Marzolin, New York, on "A New Quantitative Method for Studying Variations of the Respiratory Cycle" and "A Physiological Method for the Induction of States of Partial Sleep." Dr Stafford L Warren, Rochester, N Y, "Ethyl Iodophenylcyanate (Pantopaque): A New Contrast Medium for the Visualization of the Central Nervous System," and Drs James Watts and Robert H Groh, Washington, D C, "Vascular Facial and Cranial Neuralgia." The session concluded with a panel discussion on war injuries. The next meeting will be held in Chicago in 1943.

**Resolutions Urge Coordination in Industrial Hygiene Services**—At a meeting in Washington, D C, of the Conference of Governmental Hygienists, April 9-11, resolutions were adopted governing participation in local and national

defense service. One resolution recommends that the division of industrial hygiene of the National Institute of Health U S Public Health Service in cooperation with the special committee on industrial health and medicine of the Office of Defense Health and Welfare Service assume the leadership in developing plans to extend health services in small industries and in promoting the voluntary establishment of such programs by management. Another resolution urged the health service to direct the development and administration of the immediate mobilization of medical nursing and hospital facilities in critical war industries areas stressing the need for effecting closer working relationships with state and local departments of health for the extension of general public health services to war workers and their families.

**Special Society Elections**—Dr George Blumer New Haven was elected president of the Association of American Physicians during its annual meeting in Atlantic City May 5-6. Other officers include Drs Warfield T Longcope, Baltimore vice president and Joseph T Wearn Cleveland, secretary. Dr John B Barnwell Ann Arbor Mich, was chosen president elect of the American Trudeau Society at its meeting in Philadelphia May 8. Drs Henry Franklin Carman Dallas Texas was chosen vice president and Julius L Wilson New Orleans secretary treasurer. Dr James L Gamble Boston was chosen president of the American Pediatric Society at its meeting in Skytop Pa April 30-May 2. Dr Hugh McCulloch St Louis is the secretary. Dr Charles J Imperatori New York was elected president of the American Laryngological Association at its meeting in Atlantic City May 26. Dr Harold I Lillie Rochester Minn was chosen vice president to succeed Dr Arthur W Proetz St Louis who was named secretary. Dr Edward A Strecher professor of psychiatry, University of Pennsylvania School of Medicine, Philadelphia was chosen president-elect of the American Psychiatric Association at the meeting in Boston May 18-22 and Dr Arthur H Ruggles Providence R I was installed as president. The winner of the contest for the design of an emblem announced last year, was Wheeler Williams New York sculptor. The emblem is to be used in the centennial celebration of the association in 1944. Philadelphia where the association was founded, has been designated the place for the centennial celebration. The 1943 meeting will be held in Detroit.

**Guggenheim Fellowships**—The John Simon Guggenheim Memorial Foundation New York has announced eighty-two fellowships carrying total awards of \$196,600. Included among the many fellowships are the following for work in biology.

Thomas Rogers Forbes Ph.D. instructor in anatomy Johns Hopkins University School of Medicine Baltimore studies of the physiology of reproduction.

Robert Gaunt Ph.D. assistant professor of biology New York University studies of the functional control of the adrenal cortex.

Dr Salvador E Luria research assistant in surgery Columbia University New York studies of certain biologic and physicochemical properties of bacteriophage.

Jane Marion Oppenheimer Ph.D. instructor in biology Bryn Mawr College Bryn Mawr Pa studies of the development of structure and function in the central nervous system of fishes.

Charles L Huskins Ph.D. professor of genetics McGill University Montreal Quebec Canada the preparation of a book on the cytology and genetics of plants animals and man.

David R Goddard Ph.D. assistant professor of botany University of Rochester New York a study of the respiratory enzymes of higher plants.

Mr Dietrich Bodenstern research associate in biology Stanford University Stanford University investigations of the problem of metamorphosis in insects with special emphasis on the role of hormones in development.

Since the establishment of the foundation seventeen years ago, one thousand two hundred and ten fellowships have been awarded under stipends totaling \$2,488,000.

**Grants Awarded for Research in Nutrition**—Grants totaling \$125,000 have been awarded by the Nutrition Foundation, Inc., New York, to finance a broad program for fundamental research in the science of nutrition. The grants are the first allotted by the foundation which was formed in December. Thirty-six grants ranging from \$250 to \$7,000 each went to twenty-five universities and research groups in various parts of the United States and Canada. Five universities received multiple grants, these were Columbia, Yale and the Universities of Illinois Wisconsin and Minnesota. Institutional grants went to the Children's Fund of Michigan, Detroit, the Food and Nutrition Board of the National Research Council and the New York Agricultural Station, Geneva, N Y. The projects to be financed were chosen from eighty-one applications by the foundation's scientific advisory committee, of which Charles Glen King, Ph.D. is director. Among the studies to be considered are nutrition in relation to fatigue, effects of environment on nutritional requirements and a natural butter of high nutritional value and high melting point suitable for use in the tropics.

**Survey of Philanthropic Foundations**—A survey of reports of three hundred and fourteen foundations recently completed by Raymond Rich Associates, New York, indicates that for medical research medical education, the erection and support of hospitals and other purposes related to medicine and public health, the foundations granted individuals and institutions 30.4 per cent of their total disbursement, or \$12,273,590, during 1940. Twenty-nine per cent of the total gifts, or \$11,696,605 was given to general education. The other leading fields in which foundations subsidize projects are, in the order of volume of grants social welfare \$4,395,898, the physical and biologic sciences \$3,783,643, social sciences \$1,528,510, religion \$1,224,044 and government and public administration \$1,062,917. In bringing together these and other figures covering foundation activities and structures, the Rich organization restricted its report to foundations that paid out at least \$1,500 during 1940 for projects not directly controlled by foundation staff members. Previous surveys provide comparable figures for 1937, 1934 and 1931. Although the grants of several large foundations provided an important part of the subsidies for medical and public health projects, gifts over one million dollars in 1940 accounted for only 5.6 per cent of the total grants in this field as compared with the 1937 gifts of over one million dollars, which accounted for 7.9 per cent of the total for that year. However, the smaller foundations have devoted an increasingly larger share of their income to medical research. The four gifts of more than a million dollars in this field in 1940 were the Rockefeller Foundation \$2,884,054 W K Kellogg Foundation \$1,505,480 the Commonwealth Fund \$1,401,730 and the Duke Endowment \$1,086,581. Gifts of the Carnegie Corporation of New York for medicine and public health amounted to \$796,104 in 1940. John and Mary R Markle Foundation \$685,805 and the National Foundation for Infantile Paralysis Inc \$515,048. Projects in the educational field received 29 per cent \$11,696,605 of the grants paid in 1940. In the education field the General Education Board a Rockefeller fund, once again led with grants of \$3,033,084 in 1940 and the Duke Endowment contributed \$1,873,825. The third and fourth largest source for foundation funds in support of educational projects were the Board of Directors of City Trusts of the City of Philadelphia and the Carnegie Corporation of New York, which granted \$1,756,471 and \$1,624,446 respectively. In addition to the general educational projects surveyed in the main section of the report, a special survey has been made for the first time of support available for education through student loan funds. The thirty-two funds under survey made loans totaling \$1,158,740 during 1940 applicable to tuition in more than one institution. Social welfare received \$4,395,897, or nearly 11 per cent, of the total reported. Although ranking third in volume of grants more foundations contributed to this field than to any other. The largest two donors to social welfare projects in the year under survey were the Carnegie Foundation for the Advancement of Teaching \$1,929,443 and the New York Foundation \$285,300. The board of directors of City Trusts of the City of Philadelphia gave the third largest contribution in this field, \$127,559. The physical and biologic sciences received the fourth largest share of the grants a total of \$3,783,643. The leading donors of these funds were the Rockefeller Foundation with gifts of \$2,882,027 in 1940 the General Education Board \$478,825 and the Carnegie Institution of Washington \$151,697. Grants for the field of social sciences totaled \$1,528,510 a substantial increase over the total contributions in 1937 which puts this in fifth place in 1940 as compared with seventh place in the last study. Large grants in this field were made by the Rockefeller Foundation \$576,213 and the Carnegie Corporation of New York, \$428,996. This survey brings up to date a similar survey of two hundred and forty-three foundations published in 1939.

## FOREIGN

**Personal**—The William Julius Mickle Fellowship of the University of London has been awarded to Dr Alexander Fleming, professor of bacteriology in St. Mary's Hospital Medical School, London according to *Science*.—Dr Robert K. S. Lim, who until the war with Japan broke out in 1937 was professor of physiology, Peiping Union Medical College, Peking, China, and who since then has been in charge of the medical services of the Chinese Red Cross, has been elected foreign associate of the National Academy of Sciences. Charles Galton Darwin, Sc.D. since 1938 director of the National Physical Laboratory, London, has been named scientific adviser to the British Army Council, according to the *New York Times*.

#### The Increase in Tuberculosis

The slight increase in tuberculosis since the outbreak of war has been reported in previous letters. In a letter to the *Times* Sir Charles Wilson, president of the Royal College of Physicians, states that the increase is probably due to more than one cause. To limit the spread of the disease we must recognize it early, before the person affected has become a source of infection, when indeed he does not know that he is ill. This can be done only by x-ray examination of the chests of all the men and women in the community. During the past eight years the Royal College of Physicians has carried out a survey of his kind on seven thousand nurses, students and office workers. Cannot this be done on a national scale in time of war? In the United States, Canada and Germany the chest of every recruit is roentgenographed as a matter of routine. In England every rating in the navy is thus examined when he passes through the depot and also the flying personnel of the air force. The army has made a beginning by examining five thousand men at a special center. The question is not whether such examinations are possible but on what scale in time of war. Only a limited personnel is available, and months must elapse before apparatus ordered for mass radiography can be delivered. However, it is possible to examine every recruit for the fighting forces and desirable to extend the examination to some limited field of industry. For the individual with a latent focus there would be the advantage that he would not be submitted to work for which he is physically unfitted and that he would be treated in the most hopeful stage, for his fellow workers, that they would not be exposed to infection. The state would gain by a drastic cut in pensions for tuberculosis. During and since the last war the United States spent \$900,000,000 in pensions for the tuberculous.

#### Hospital for Treatment of Industrial Injuries

The first of a new type of hospital—one specialized for the treatment and rehabilitation of persons injured in industry or road accidents—has been established. In the great industrial city of Birmingham the Queens Hospital, an important general hospital and medical school for a century, has been specialized for this purpose. The process of conversion was begun nearly a year ago but is not yet completed. In the first nine months 1,500 inpatients and 11,000 outpatients were treated in this accident hospital. The latter are now attending at the rate of 350 a week. The expenditure of the hospital is estimated at \$300,000 a year and is to be met by contributions from the Ministry of Health, the Hospital Contributory Association, the Birmingham Corporation and a subsidy from industry.

All hospitals in industrial areas of course afford service to industry, but the Birmingham Accident Hospital, in addition to being entirely a casualty service, is intended to be a training center for industrial nurses and ambulance and first aid workers. It will be connected with Birmingham University as a teaching center for undergraduate and postgraduate medical students. It will also be a center for industrial medical officers attached to the various works. Regular meetings with the medical staff of the hospital will be held and cases will be discussed. It may become a center from which medical officers are recruited. As the full title, "Birmingham Accident Hospital and Rehabilitation Center" shows, the patients will be treated until they are fit to return to work. Vocational training centers may be established in the larger factories in association with the hospital for those who cannot resume their former occupation.

#### Sir Thomas Lewis Awarded Medal

The Copley medal, the highest honor of the Royal Society, has been awarded to Sir Thomas Lewis. The president, Sir Henry Dale, pharmacologist, described Lewis as "renewing and carrying forward with special directness the great tradition which William Harvey created before the society was founded." The Copley medal is given yearly for eminence in any branch of natural science and is entirely free from national restrictions. Among biologists who have received it are Darwin (1864), Pasteur (1874), Bernard (1876) and Virchow (1892). Few men have gained this honor at such an early age as Lewis. Only once in the last hundred years has it been given to a clinician (Lord Lister in 1902). The president described Lewis's work as still in vigorous progress but for interruption by war duties and as the application of precise and controlled methods of experimental research to problems of clinical medicine. This has enabled him to achieve a detailed analysis of abnormalities of function produced by disease, injury or hereditary defect. So far his attention has been centered on the circulation of the blood and its disorders. Attracted by the work of Mackenzie to the study of abnormal rhythms of the heart, he recognized, about 1908, the opportunity for closer investigation offered by the string galvanometer of Einthoven. With its aid he identified auricular fibrillation as the cause of a particular kind of complex irregularity. He traced with astonishing precision of measurement and timing the point of origin and course of the rhythmic waves of excitation and contraction in the normal heart of the dog and finally, for comparison, in other vertebrates. This is one of the noteworthy achievements of experimental physiology in our time and has given to physiology much of the present detailed knowledge of the nature of the heart beat. But for Lewis its greater importance lay in giving to clinical medicine the background for an accurate picture of disturbances of the normal mechanism and an advance in the diagnosis, prognosis and treatment of disordered action of the heart.

In 1917 Lewis began investigations by direct experiment on the blood vessels of the human skin. He elucidated the means by which the resistance to the flow of blood is maintained and varied, including their complex reactions to chemical substances akin to histamine, which he showed were released from the cells of the epidermis by injury or irritation. He extended these investigations to vascular disorders of the limbs and more recently to pain and functional defects in muscles and nerves due to interruption of the blood supply. He has been an inspiring leader of young workers in clinical research as an experimental science.

#### The Food Situation

In the House of Commons Major Lloyd George, parliamentary secretary to the Ministry of Food, stated that twelve months ago the country was enduring the worst trials of the war on the food front. Our principal sources of supply had been cut off, we were subjected to intensive aerial bombardment of our ports and industrial centers and our shipping was attacked by submarine and airplane. During the winter of 1940-1941 our food imports showed a substantial decline. Moreover, food importing was reduced both by the loss of ships and by diversion to the support of military operations abroad. But thanks to stocks which had been accumulated we maintained our supplies. During the second half of 1941 a substantial improvement occurred and stocks in December 1941 were 30 per cent higher than in 1940. This was due to two factors: increased agricultural production and substantial help from the United States in which canned meats and milk products gave us exactly what we wanted to improve our dietary.

This year would be a difficult period. We had to decide whether any particular ship could best contribute to us by bringing food or by supplying our armies abroad. It might be necessary to reduce our existing rations. We had passed through two and one-half years of war without any...

sacrifice, though with inconvenience and loss of freedom. The system of rationing and price control had worked very well and enabled each consumer to get a fair share. The ministry was trying to look after food according to the needs of the people. There were five thousand five hundred workers' canteens serving substantial meals as well as snacks. Eighty per cent of the miners had canteen facilities, and before long 95 per cent would have them. Special efforts were made, with every evidence of success, to prevent children suffering from the restrictions of food supplies. About six hundred and fifty thousand were receiving meals at school and three and a half million were obtaining milk in addition to priority supplies at home. Supplies of black currant juice and cod liver oil were made available to them, and they had priority for oranges. Need rather than ability to pay had been the mainspring of the ministry's policy.

### The Importance of Dried Foodstuffs

In a series of lectures on planned nutrition in wartime, Prof J C Drummond called attention to the importance of dried foodstuffs. Recently the Low Temperature Research Station at Cambridge produced experimental batches of dried vegetables containing about 80 per cent of the original vitamin content of the fresh vegetable. The vitamin loss from exposure to air had been prevented by packing the dried product in an inert gas. Thus dried vegetables could be kept indefinitely at the full vitamin value of the material as put in the container. In the case of meat the Cambridge experiments resulted in a product which, on addition of water, was reconstituted so as to be practically indistinguishable from a cooked mincemeat and usable in the form of rissoles and the like. The product also maintained its character for several years when kept in a gas pack and was a great advance on anything heretofore produced as dried meat. A combination of dried vegetables and meat in the form of powder has also been produced and on addition of hot water gives a palatable soup. Professor Drummond thinks that the drying of foodstuffs will become as important as the canning industry has been during the last thirty years. The dried product, when reconstituted, is similar in palatability to the fresh material, while the vitamin content and other materials specially valuable in wartime nutrition are preserved.

### Increased Rationing

Dried fruits and certain cereals and pulses have been rationed for the first time. They include rice, sago, tapioca, lentils, dried peas and all dried fruits, including evaporated fruits and dates. They are not rationed by quantity per head, but coupons must be surrendered in order to obtain them, according to a scale laid down.

### The Use of Vitamins in Hemorrhagic States

At the Section of Therapeutics and Pharmacology of the Royal Society of Medicine Dr Harold Scarborough said that the effect of vitamin D in controlling the bleeding tendency in jaundice had been shown by Ivy and his associates but was in some danger of being forgotten in the spate of literature about vitamin K. No satisfactory explanation of the effect of vitamin D was available, but it was known to increase the serum calcium, which had a function in coagulation. As to the effect of vitamin C on the hemorrhagic state, a low capillary condition was found in scurvy, but save in special circumstances he had never found that ascorbic acid increased capillary resistance. Lack of capillary resistance did not appear to be due to lack of ascorbic acid. Scurvy was a complex deficiency state and in certain conditions capillary resistance might be temporarily increased. There was evidence that petechial bleeding might be produced by deficiency of vitamin P. Many of the bleeding diseases were associated with low capillary resistance, i.e. with excessively fragile capillary walls. If purpura depended on this administration of vitamin P would be the logical treatment. Scarborough reported a case of petechial bleeding and epistaxis

in a woman of 75 in which petechial bleeding stopped under administration of vitamin P and recurred when this was stopped.

Dr R G Macfarlane said that hemorrhagic disease in the newborn responded to vitamin K. Mr A L Bacharach described animal experiments with vitamin P which showed that when ascorbic acid failed to improve purpuric bleeding in deficiency states the purpuric spots cleared up under vitamin P. Such cases had also been seen in clinical practice. In reply Scarborough said that only certain forms of purpura were susceptible to treatment by vitamin P. The form found in congestive heart failure was not, at least with such preparations as were now available.

### Naval Surgeon Who Worked to the End

Among those saved when the battleship *Prince of Wales* was sunk by Japanese air attack is Surgeon Lieut-Comdr E D Caldwell. While the vessel was sinking he remained on board administering morphine, bandaging the wounded and placing them on rafts. Only when the ship heeled over a minute before her last plunge did he follow his patients into the sea.

## BRAZIL

(From Our Regular Correspondent)

April 4, 1942

### War Medicine in Brazil

The problems of war medicine are being studied by Brazilian doctors as a means of cooperating in the struggle against the common enemy. Many doctors are devoting all their time to military medicine. The medical societies have held many discussions about war medical problems.

In São Paulo, which is one of the principal centers of the country, the Associação Paulista de Medicina is engaging in an extensive series of conferences. At the first meeting Prof Bernardes de Oliveira emphasized the good results from the use of sulfanilamide applied at once locally to wounds on the battlefield. This method has already been used on injured workers of the Paulista Railway, and patients have been removed safely after fifteen or sixteen hours as far as 400-500 kilometers. At the same meeting excellent effect of sulfanilamide by arterial injection was pointed out, according to the method proposed by Dr Eurico Branco Ribeiro, in the treatment or prevention of infection of the extremities.

Later Prof Alípio Correa Netto discussed the modern management of burns.

### Tuberculosis and Syphilis in Prostitutes in Rio de Janeiro

The problem of tuberculosis among prostitutes has been studied by Drs Aloisio de Paula, Francisco Benedetti and Cecilia Ribas Ferreira. Chest roentgenograms of 1,684 women revealed active tuberculosis in 36. Among 26 with the infiltrative type 19 had the initial form, in 5 of whom it was so slight as to be considered borderline. There was observed a high incidence of syphilis. According to roentgenographic demonstration by Abreu's method the rate of aortitis was 11.1 per cent in 1,684 women.

### Immunization Against Tuberculosis

The wide use of BCG vaccine against tuberculosis in Rio de Janeiro is demonstrated by recent statistics published concerning the work of the Instituto Viscondessa de Moraes. In 1941 the institution administered the vaccine to 14,632 children. Since 1927 the number of immunized children has increased to 105,858.

### Death of Professor Torres

Prof Lemos Torres, director of the Escola Paulista de Medicina, was thrown from a horse and died immediately. He was a well known Brazilian scientist whose works on cardiol-

ogy and phthisiology are spread throughout all Latin America. He proposed a personal sign to indicate small pleural effusion. As the new director of the Escola Paulista de Medicina Prof Alvaro Guimarães Filho, teacher of obstetrics in the school, has already been named.

PALESTINE

(From Our Regular Correspondent)  
April 30, 1942

Report of the Health Department

In the report of the health department for the year 1940 just published some data are remarkable. Out of the total expenses of the government, only 3 per cent went to the expenses of the department of health. The general death rate per thousand population rose from 3.90 in the year 1939 up to 18.49 in 1940. This increase is to be referred mainly to the existing epidemic of measles. For each of the communities births, deaths and child mortality have been as follows:

|            | Population | Mortality<br>per<br>Thousand<br>Population | Births<br>per<br>Thousand | Child<br>Mortality<br>per<br>Thousand<br>Births |
|------------|------------|--|---------------------------|---|
| Christians | 118,866    | 12.21                                      | 31.11                     | 107.00  |
| Moslems    | 873,451    | 24.74                                      | 47.42                     | 147.14  |
| Jews       | 456,001    | 8.18                                       | 23.72                     | 59.07   |
| Others     | 12,413     | 18.13                                      | 50.75                     | 106.35  |

The main causes of death have been diarrhea and enteritis 18.1 per cent, pneumonia 18 per cent, diseases of the heart 6.9 per cent, cancer and other malignant tumors comes sixth, 4 per cent, followed by measles, 3.4 per cent. The infectious diseases during the year 1939 in comparison with the year 1940 show incidence of measles rose from 237 up to 14,469 cases, with deaths from 11 in 1939 up to 1,422 in 1940, typhoid 1,235 cases in 1939 with 134 deaths and 1,684 cases in 1940 with 165 deaths. Two new endemic fields for leishmaniasis have been discovered in Jericho and Haifa, where 200 patients were treated during the year.

Second Nutrition Conference in Jerusalem

In December 1941 Col G. W. Heron, head of the health department, controller of supply, spoke at the second Nutrition Conference in Jerusalem. A list of the simplest of all daily rations from commodities of local production was given by Colonel Heron. This list included flour, wheat, millet, olive oil, onions, lentils, raisins, oranges, grapes, melons and vegetables. Milk, the supply and distribution of which had been announced as being the main topic for consideration at the conference, was not included. Later Colonel Heron included milk in his list of highly desirable foods rather than among the essentials.

Control of Malaria in Palestine

Recently the government published "A Review of the Control of Malaria in Palestine (1918-1941)," which, with the help of very instructive maps, shows the most successful efforts to fight this disease undertaken by the department of health. In 1918, when the Palestine administration was taken over by Great Britain and Jewish colonization was just starting, malaria was one of the main scourges of the country. As the report states, the great success of the antimalarial work has been made possible mainly by "that unique cooperation from both Arab and Jew which is a distinctive feature of the Palestinian campaign against this disease." The rate of enlarged spleens, for example, dropped in Jerusalem—a notorious center of malaria—from 44.3 per cent in 1918 to 1.6 per cent in 1940. While in 1922 about 7.2 per cent of government dispensary patients in urban districts were treated for malaria, only 0.5 per cent

attended dispensaries all over Palestine in 1940. According to the heading of the brochure, one would expect to find more about the antimalarial work done by the Jewish health authorities, that is by the hygiene department of the Hebrew University with its Malaria Research Station at Rosh Pina. The great progress achieved with the assistance of this part of the population has already been mentioned in the Report of the British Royal Commission under the late Earl Peel in 1937.

Fourth Microbiological Congress

In October 1941 the fourth Microbiological Congress took place in Jerusalem under the chairmanship of Prof I. J. Kligler. The subjects treated included general biology and physiology of micro-organisms, the effectiveness of certain chemotherapeutic drugs and immunobiologic questions. Papers were read by Leibowitz, Hossain and Avineri Shapiro on the fermentation of polysaccharides and disaccharides through micro-organisms. As a result of these investigations, it appears that direct fermentation of complex sugars with no preliminary hydrolysis (maltose) is possible. Ernst Simon reported on the fermentation of butanol-acetone through Clostridium (Weizmann), Kligler and Grossowitz reported on the effect of nicotinic acid on the bacterial metabolism, Sulman on the degradation of estrogenic hormones by means of certain germs, stressing the importance of proteus X and certain kinds of yeast in this connection. Adler and Foner gave an outline, among other subjects, on their cultivation methods of intestinal protozoa on semisolid culture mediums, especially the cultivation of Endameba histolytica on twenty-four hour cultures.

Diagnostic problems were preponderantly referred to by Gurevitch, who gave an account of his diagnostic and differential diagnostic results obtained with the typhoid material of the Rothschild Hadassah University Hospital.

Guest Lecturers

Dr E. G. Holmes, fellow and tutor of Downing College, Cambridge, and university lecturer in biochemistry, gave two guest lectures on the "Effects of Toxemia on Metabolic Processes" at the Strauss Health Center in Jerusalem in November 1941.

In September 1941 Lieutenant Colonel Fruchaud, professor of surgery (chief medical officer of the Hadfield Spear Hospital Unit, consulting surgeon of the Free French Forces), reported on "War Wounds and Their Treatment." He presented two methods—the French method of wound excision ("ephuchage") and the Spanish method (occlusion with adhesive plaster). Fruchaud was in favor of the former and stressed the necessity of completely removing the entire dead tissue, while later only a simple dressing with no rinsing of the wound is necessary.

Dr Henry Wigderson, Appointed Head Neurosurgeon, Hadassah, Jerusalem

Dr Henry Wigderson, former instructor in surgery (neuro surgery) at New York University College of Medicine, who has been appointed head neurosurgeon in the Rothschild Hadassah University Hospital, Jerusalem, gave his first public lecture, on the occasion of the second Congress of Neurology in Tel-Aviv, April 17-19.

Army Ambulances

Three standard army ambulances built and equipped by the people of Tel-Aviv were presented to the army. The ambulances, decorated with the Tel-Aviv crest, were handed over in March to the area commander, Colonel Wilkins, by the mayor of Tel-Aviv, Mr. Rokach.

Plague in the Haifa Region

For the first time after a long period plague infected rats appeared in the Haifa region in 1941. Ten human cases (resulting in two deaths) were reported.

## Deaths

**John Miller Turpin Finney** <sup>†</sup> professor emeritus of surgery at Johns Hopkins University School of Medicine, died, May 30 at his home in Baltimore aged 78.

Dr Finney was born in Natchez, Miss., June 20, 1863. His fundamental education included Princeton from which he graduated in 1884 and where he played on the football team, Harvard Medical School, Boston with graduation in 1889 and the Massachusetts General Hospital. He joined the faculty of Johns Hopkins University School of Medicine in 1893 and was subsequently associate professor of surgery, professor of clinical surgery and professor of surgery. He had been professor emeritus since 1933. Concurrently during his long teaching career Dr Finney held many staff positions at the Johns Hopkins Hospital serving too on the staffs of the Union Memorial Hospital, Church Home and Infirmary Hospital for Women and Sinai Hospital.

Dr Finney was a member and past president of the American Surgical Association, Medical and Surgical Faculty of Maryland, Inter-State Post Graduate Association of North America, a founder and past president of the American College of Surgeons, a past president of the Southern Surgical and Gynecological Association and a member of the Society of Clinical Surgery. Included among the organizations in which he held honorary fellowships were the Medical Society of London, the Hunterian Association of London, the Royal College of Surgeons of England and the Royal College of Surgeons of Ireland. At one time he was offered the presidency of Princeton and he was for long a member of its board of trustees.

Dr Finney entered World War I with the title of major as director of the Johns Hopkins Hospital medical unit. He was awarded the Distinguished Service Medal by the American government for his services as chief consultant with the rank of brigadier general to the American Expeditionary Forces. In 1920 he was decorated with the insignia of an officer of the French Legion of Honor on behalf of the French government for his ministrations to French soldiers in American hospitals overseas. He was also made *Commandeur de l'Ordre de la Couronne* Belgium. In 1931 he was awarded the Henry Jacob Bigelow Gold Medal by the Boston Surgical Society for his scientific contributions to and distinguished services in the field of surgery. In 1931 he was appointed consultant to the Committee on the Costs of Medical Care and in 1934 to the Baltimore City Health Department. Honorary degrees have been conferred on him by many universities including Tulane, Harvard and Jefferson Medical College. In 1939 he directed the establishment of the blood transfusion bureau of the Baltimore chapter of the American Red Cross.

In 1937 Dr Finney was honored when the Finney-Howell Research Foundation for cancer fellowships was created under the will of the late Dr George Walker. At the time of his death Dr Finney was president of the foundation. In 1938 he was accorded many honors to commemorate his seventy-fifth birthday including the presentation of a bust of himself executed by Hans Schuler. He had made numerous contributions to the literature and had devised a method of performing gastro-duodenostomy which bears his name.

Dr Finney's death closes a long and distinguished career in the field of surgery. He was active in the civic affairs of his community in the Presbyterian Church and in public education in Baltimore. He was a broad minded man with a sense of

humor that carried him through many difficult situations. Frequently he was called to attend great statesmen and leaders, whom he impressed invariably with the dignity of medicine as a profession. In his autobiography, published in 1940 he wrote "Are our ideals too high? Are we striving after the unattainable? After over fifty years of close association with members of the profession, frankly I do not think so. Unquestionably, not all members of the medical profession measure up to these requirements. But doctors are only human as a class perhaps more human than any similar group of individuals because from the very character of their work they gain such insight into human nature and thus come to understand it so well and respect it so highly. This is one of the chief characteristics of the true doctor and one of the crowning glories of a profession most exacting in its demands upon the time and talents of its members, and at the same time offering unlimited opportunities for usefulness in the way of service to humanity. It is this human element, this call to the aid of his fellowmen, wherein lies the charm that appeals so strongly to the true physician."

The joy and satisfaction experienced in relieving the ills and ministering to the wants of humanity more than compensate him for the loss of the larger social and pecuniary returns that come from other less onerous and responsible locations. The true physician is supremely happy in his work. He could not be happy doing anything else. Once having caught the vision as it unfolds before his gaze all else fades into insignificance."

**David Bryson Delavan** <sup>†</sup> New York, College of Physicians and Surgeons, medical department of Columbia College, New York, 1875, an Affiliate Fellow of the American Medical Association, diplomate of the American Board of Otolaryngology, fellow of the American College of Surgeons, corresponding secretary of the New York Academy of Medicine from 1914 to 1926 when that office was abolished, honorary fellow of the American Laryngological Association and its president in 1893 and in 1918, past president of the New York Laryngological Society, fellow of the Congress of American Physicians and Surgeons, honorary fellow of the Philadelphia Laryngological Society, a charter member of the American Society for the Control of Cancer, member of the Harvey Society, New York Clinical Society and many other societies, for many years president of the Russell Sage Institute of Path-

ology, at one time professor of laryngology and rhinology at the New York Medical School and Hospital, consultant in laryngology and rhinology at the Mount Sinai Hospital, the Skin and Cancer Hospital, St. Luke's Hospital, Memorial Hospital and the Hospital for Ruptured and Crippled, the latter hospital now being known as the Hospital for Special Surgery, president of the medical board of St. Luke's Home, president of the Grenfell Association of America from 1917 until 1930, in 1931 was awarded the De Roaldes gold medal by the American Laryngological Association, aged 92, died May 23 of arteriosclerosis.

**George Sellers Graham** <sup>†</sup> Birmingham, Ala., Dartmouth Medical School, Hanover, N. H., 1905, professor of pathology at the University of Alabama School of Medicine, instructor of pathology and bacteriology from 1906 to 1910 and assistant professor of pathology from 1910 to 1913 at his alma mater, formerly professor of pathology at the University of Alabama Graduate School of Medicine, professor of pathology at the Albany (N. Y.) Medical College from 1917 to 1921, member of the American Association of Pathologists and Bacteriologists and the American Society of Clinical Pathologists, member of the American Board of Pathology, Inc., assistant bacteriologist for the New Hampshire State Board of Health from 1907 to 1913, first assistant in pathology 1914-1915 and second

JOHN M. T. FINNEY, MD 1863-1942

assistant in pathology, 1915-1916, Boston City Hospital, pathologist and director of laboratories of the Vancouver (B C) General Hospital, 1916-1917, aged 63, died, May 2

**John Brooks Wheeler** ♂ Burlington, Vt, Harvard Medical School, Boston, 1879, instructor in surgery at the University of Vermont College of Medicine from 1881 to 1890, professor of clinical and minor surgery from 1890 to 1900 and professor of surgery from 1900 to 1924 and since 1924 emeritus professor of surgery, member, past president and vice president of the New England Surgical Society, past president of the Vermont State Medical Society, fellow of the American College of Surgeons, member of the American Board of Surgery, trustee of the University of Vermont from 1916 to 1920, consulting surgeon, Mary Fletcher and Bishop de Goesbriand hospitals, Burlington, and the Fanny Allen Hospital, Winooski, served during World War I, author of "Memoirs of a Small Town Surgeon", aged 88, died, May 1

**John Gardner Hayden** ♂ Kansas City, Mo, Rush Medical College, Chicago, 1904, assistant in surgery at his alma mater, 1906-1907, assistant professor of surgery at the University of Kansas School of Medicine, Kansas City, from 1909 to 1926 and since 1926 associate professor of clinical surgery, past president of the Jackson County Medical Society and the Kansas City Academy of Medicine, formerly vice president of the American Association of Railway Surgeons, fellow of the American College of Surgeons, served during World War I, division surgeon for the Rock Island Railroad, the Chicago, Milwaukee and St Paul Railroad and the Pullman Company, aged 62, attending surgeon, Bell Memorial Hospital, Kansas City, Kan, and St Luke's Hospital, where he died, April 17, of bacterial endocarditis

**James Hugh Finch** ♂ Champaign, Ill, College of Physicians and Surgeons, Baltimore, 1895, member of the Clinical Orthopedic Society, fellow of the American College of Surgeons, past president of the Champaign County Medical Society, served during World War I, retired lieutenant colonel in the Medical Reserve Corps of the U S Army, for many years physician for the University of Illinois athletic teams, on the staffs of the Burnham City Hospital, Champaign, and the Champaign County and Mercy hospitals, Urbana, aged 71, died, April 21, of coronary thrombosis

**William Jacob Frick**, Kansas City, Mo, Kansas City (Mo) Medical College, 1888, member of the House of Delegates of the American Medical Association, 1916-1917, member of the Missouri State Medical Association, past president of the Jackson County Medical Society, fellow of the American College of Surgeons, formerly clinical professor of surgery at the University of Kansas School of Medicine, Kansas City, served during World War I, surgeon, Research and Kansas City General hospitals, aged 78, died, April 1

**Frederic Mortimer Johnson** ♂ Yonkers, N Y, Syracuse University College of Medicine, 1904, member of the National Gastroenterological Association, member of the American Board of Internal Medicine, at one time adjunct professor of gastroenterology at the New York Polyclinic Medical School and Hospital, New York, past president of the Westchester Society of Gastro-Enterology, physician for the draft board, on the staff of St John's Riverside Hospital, aged 67, died in April

**Manson M Lairy** ♂ Lafayette, Ind, Medical College of Indiana, Indianapolis, 1893, fellow of the American College of Physicians, at one time medical director of the Lafayette Life Insurance Company, formerly member of the city council and for many years member of the board of education, formerly on the staff of St Elizabeth's Hospital, aged 79, died, April 13, of mesenteric embolus and auricular fibrillation

**Harry Roy Lohnes** ♂ Buffalo, University of Buffalo School of Medicine, 1904, professor of pediatrics emeritus at his alma mater, member of the American Board of Pediatrics, Inc, member of the American Academy of Pediatrics, served during World War I, for many years on the staffs of the Buffalo General, Children's and Edward J Meyer Memorial hospitals, aged 63, died, April 1, of coronary sclerosis

**Nelson Ferguson McClinton**, Saginaw, Mich, University of Michigan Department of Medicine and Surgery, Ann Arbor, 1898, member of the Michigan State Medical Society, past president of the Saginaw County Medical Society, at one time mayor of Alma, member of the American Urological Association, on the staffs of St Mary's, St Luke's and Saginaw General hospitals, aged 67, died, April 8

**Joe Newton Sisk** ♂ Madison, Wis, Baylor University College of Medicine, Dallas, Texas, 1921, member of the Radiological Society of North America, Inc, and the Ameri-

can College of Radiology, member of the American Board of Radiology, Inc, for many years associated with the Jackson Clinic, on the staff of the Methodist Hospital, aged 51, died, April 25, of cerebral hemorrhage

**James Frederic Clarke** ♂ Fairfield, Iowa, University of Pennsylvania Department of Medicine, Philadelphia, 1889, fellow of the American College of Surgeons, an Affiliate Fellow of the American Medical Association, formerly mayor of Fairfield, veteran of the Spanish-American War and World War I, on the staff of the Fairfield County Hospital, aged 78, died, April 12, of uremia

**Sidney King Morrison** ♂ Reno, Nev, Cooper Medical College, San Francisco, 1902, member of the House of Delegates of the American Medical Association in 1924, formerly county physician, was chief medical examiner for the draft board during World War I, past president of the state board of medical examiners, aged 63, died, April 5, of carcinoma of the lung

**Lyston D Howe**, Streator, Ill, College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1903, member of the Illinois State Medical Society, formerly county coroner, served in the Streator district in connection with the Selective Service System, aged 61, died, April 11, in St Mary's Hospital of hemorrhage and duodenal ulcer

**Charles Maddox Hammett** ♂ Washington, D C, Georgetown University School of Medicine, Washington, 1892, professor of ophthalmology emeritus at his alma mater, member of the American Board of Ophthalmology, fellow of the American College of Surgeons, on the staffs of the Providence and Georgetown University hospitals, aged 70, died, April 21

**Nelson McLaughlin**, Detroit, Eclectic Medical Institute, Cincinnati, 1907, member of the Michigan State Medical Society, past president and secretary of the Michigan State Board of Registration in Medicine, served during World War I, aged 59, on the staff of the Highland Park (Mich) General Hospital, where he died, April 8, of heart disease

**John Street Fulton**, Topeka, Kan, College of Physicians and Surgeons, Medical Department Kansas City University, Kansas City, Kan, 1901, formerly health officer of Lyon County, public school physician, served during World War I, aged 69, died, April 10, in the Veterans Administration Facility, Wadsworth, of cerebral hemorrhage

**John Clement Cowden**, Tonopah, Nev, Pacific Coast Regular College of Medicine, San Francisco, 1900, veteran of the Spanish-American War, county health officer, formerly on the staff of the Tonopah Mines Hospital, aged 78, was burned to death, April 20, when his home caught fire from a faulty oil burner in the kitchen stove

**John Sherman Leffel** ♂ Connersville, Ind, Indiana University School of Medicine, Indianapolis, 1917, past president of the Fayette-Franklin Counties Medical Society, served during World War I, member of the school board, examining physician for the local Selective Service System, aged 53, died, April 20, of coronary thrombosis

**Harry Bayne Magee**, Peoria, Ill, University of Pennsylvania Department of Medicine, Philadelphia, 1908, member of the Illinois State Medical Society, past president of the Peoria City Medical Society, member of the Radiological Society of North America, Inc, aged 57, died, April 20, of rheumatic heart disease and mitral stenosis

**William Binford King** ♂ Arlington, Va, George Washington University School of Medicine, Washington, D C, 1925, formerly associate professor of anatomy at his alma mater, assistant chief medical and liaison officer of the emergency medical service in the metropolitan area defense organization, aged 53, died, April 10

**James Frederick Hazlewood**, Toronto, Ont, Canada University of Toronto Faculty of Medicine, 1907, medical officer on the Workmen's Compensation Board, formerly director of the Toronto Public Health Laboratories, served with the Canadian Army during World War I, aged 57, died, April 6

**Alice E Kelly Higgins** ♂ Rockville Centre, N Y, Tufts College Medical School, Boston, 1907, member of the American Academy of Pediatrics, on the staffs of the Brooklyn (N Y) Hospital, the Meadowbrook and Mercy hospitals, Hempstead, aged 58, died, April 28, of carcinoma of the breast

**Henry Charles Krohn**, New Holstein, Wis, Marquette University School of Medicine, Milwaukee, 1914, member of the State Medical Society of Wisconsin, for many years chief officer of New Holstein, aged 59, died, April 15, in the Marquette Hospital, Sheboygan, of cerebral hemorrhage

Walter Maurice Lacey & Chevenne W. Harvard Medical School Boston, 1912 served during World War I, formerly member of the state board of medical examiners, on the staff of the Laramie County Memorial Hospital, aged 58, died April 6, of acute myelogenous leukemia

John T. Lemmel, Beloit Wis. College of Physicians and Surgeons of Chicago School of Medicine of the University of Illinois, 1907 member of the draft board of Green County during World War I, aged 59 died April 14, in the Beloit Municipal Hospital of coronary occlusion

William Douglass Martin, Washington Pa., Western Pennsylvania Medical College, Pittsburgh 1892 member of the House of Delegates of the American Medical Association in 1919, formerly medical director of Washington County, aged 82, died April 8 of pneumonia

Orlando Conrad Hankison, Pine Bluff Ark., Vanderbilt University School of Medicine Nashville Tenn., 1892, member of the Arkansas Medical Society past president and secretary of the Jefferson County Medical Society, aged 75, died, April 14, of hypostatic pneumonia

John Wilson Frost, Lobelville, Tenn. Memphis Hospital Medical College, 1913 served during World War I, formerly health officer of Humphreys and Obion counties, aged 55, died, April 22 in the Veterans Administration Facility Memphis, of myocarditis and hypertension

James Haydn Higgins, Marston's Mills Mass., College of Physicians and Surgeons Boston 1894 member of the Massachusetts Medical Society aged 71 on the staff of the Cape Cod Hospital, Hyannis, where he died, April 7, of malignant tumor of the pituitary gland

Merrill E. Liston & South Bend, Ind., University of Kansas School of Medicine Kansas City, 1935, member of the American Society of Anesthetists, Inc., aged 33, died, April 24, in the Epworth Hospital of abdominal carcinomatosis

Jesse Myron Hays, Columbus, Ohio, Ohio State University College of Medicine, Columbus 1924 served during World War I, aged 46, on the staff of the White Cross Hospital, where he died, April 19 of lymphosarcoma

Douglas S. Bonar, Newport Ky. Kentucky School of Medicine, Louisville, 1886, member of the Kentucky State Medical Association, aged 83, died April 16, at his home in Southgate of coronary occlusion

Edwin Gaillard Adams, Greensboro Ga., Vanderbilt University School of Medicine Nashville Tenn., 1899, member of the Medical Association of Georgia, served during World War I, aged 64, died, March 18

Martin K. Kreider, Goshen, Ind., Chicago Homeopathic Medical College, 1878, member of the Indiana State Medical Association, at one time county coroner, aged 95, died, April 16, of hypostatic pneumonia

John Wade Chambliss, Americus, Ga., Atlanta School of Medicine, 1907, member of the Medical Association of Georgia, was associated with the Prather Clinic, aged 61 died, April 5, of coronary occlusion

Albert Lee Alderson, Pana Ill., University of Illinois College of Medicine, Chicago, 1913 served during World War I, aged 54, died, April 27 of injuries received in an automobile accident

William Galvin, North Adams Mass. University of Vermont College of Medicine, Burlington 1892, member of the Massachusetts Medical Society, aged 83, died, April 8 of arteriosclerosis

Dan German Sr., Franklin, Tenn., University of Nashville Medical Department, 1906, part owner of the German-Rice-Guffee Hospital, aged 66, died April 20 of cerebral hemorrhage

Christopher Fleming Keefe, Kingston N. Y. Bellevue Hospital Medical College New York, 1878 aged 87, died April 2 of cardiac hypertrophy with decompensation and arteriosclerosis

Sydney Lee Martin, Leaksville, N. C., Baltimore Medical College, 1892 also a druggist, formerly member of the school board for many years bank president, aged 78, died, February 21

Edward Soule Dickey, East Chicago Ind., Western Pennsylvania Medical College Pittsburgh 1902 aged 67 died, April 14, in St. Catherine's Hospital of coronary thrombosis

Bertrand Francis Dunn, Portland Maine Medical School of Maine Portland, 1866 member of the Maine Medical Association, Civil War veteran aged 98, died, April 11 of senility

Jacob A. Grekin & Pittsburgh, University of Pittsburgh School of Medicine 1908, aged 61, on the staff of the Montefiore Hospital, where he died April 5, of coronary thrombosis

Aaron Jeffery, Newport News, Va., Medical College of Virginia Richmond, 1884, member of the Medical Society of Virginia, aged 79, died, April 14 of carcinoma of the bladder

Harvey H. Koons, New Castle, Ind., Medical College of Ohio, Cincinnati, 1897, member of the Indiana State Medical Association, aged 68, died, April 4, of coronary occlusion

Ralph Adolphus Butler & Clinton, Iowa State University of Iowa College of Medicine Iowa City, 1912, aged 56, died, April 7, in Safety Harbor, Fla., of chronic myocarditis

William Walter Smith, New York, College of Physicians and Surgeons, medical department of Columbia College, New York 1895, aged 73, died, March 2, of myocarditis

Charles Perry Clarke, Rochelle Ill., Chicago Homeopathic Medical College, 1897, served during World War I, aged 68, died, April 30, of coronary thrombosis

Orestes A. Brownson, Los Angeles, St. Louis College of Physicians and Surgeons, 1906, served during World War I, aged 57, died, April 6, of coronary thrombosis

Stanley Burton Minish & Carrollton Ky., University of Cincinnati College of Medicine, 1941, aged 29, died, April 1, of a self-inflicted bullet wound

William Henry Crowder, Kansas City, Mo., University Medical College of Kansas City, Mo., 1903, aged 64, died, March 11, of myocarditis

Charles Manning Keep, Brookline, Mass., Harvard Medical School, Boston, 1888, also a dentist, aged 75, died, April 4, of cerebral thrombosis

Irwin Hiram Le Barre, Mansfield Ohio Trinity Medical College, Toronto, Ont., Canada, 1897, aged 67, died, April 15, of coronary occlusion

John De Witt Du Mond, Olivebridge, N. Y., Bellevue Hospital Medical College, New York, 1886, aged 77, died, March 9, of nephritis

Noah Montroville Robinson & Vinton, Va., Medical College of Virginia, Richmond, 1904, aged 66, died, March 5, of heart disease

Aaron B. Grove, Shadygrove, Pa., Jefferson Medical College of Philadelphia, 1880, aged 84, died, March 30, of chronic nephritis

Abraham Lincoln Howe, Pacific Palisades, Calif., Western Pennsylvania Medical College, Pittsburgh, 1894, aged 80, died, April 5

Robert W. Dulaney, Johnson City, Tenn., University of Louisville (Ky.) Medical Department, 1898, aged 70, died, April 5

Louis Howell Beck, Glendale, Calif., College of Physicians and Surgeons, Keokuk, Iowa, 1885, aged 86, died, April 15

Francis Osborne Tyler, St. Charles, Mo., Meharry Medical College Nashville, Tenn. 1927, aged 45, died, March 10

Levi Hulbert Fuller, Pasadena, Calif., Dartmouth Medical School, Hanover, N. H., 1888, aged 76, died, March 8

William Francis Zander, Fort Meade, Fla. (licensed in Florida in 1914), also a minister, aged 88, died, March 12

Robert M. Sterrett, Jamaica, N. Y. College of Physicians and Surgeons of Chicago, 1890, aged 85, died March 31

Luther Pascal Bowers, Philadelphia, Medico-Chirurgical College of Philadelphia, 1900, aged 77, died, March 8

Ella H. Griffith, Denver, Denver Homeopathic College, 1900 aged 79, died, April 11, of cerebral hemorrhage

Harriet Bailey Clark, Altamont, N. Y., Ohio Medical University Columbus, 1906, aged 82, died, March 15

David Westwood, Provo, Utah, College of Physicians and Surgeons Baltimore, 1902, aged 71, died, March 8

William Alfred Lawson, Halifax N. S., Canada, Halifax Medical College, 1903, aged 66 died, January 11

Lawrence James Dailey Jr., Albany N. Y., Albany Medical College, 1920 aged 45, died, April 17

Walter Burgess, Pana Ill. Marion-Sims College of Medicine St. Louis, 1897, aged 68, died April 26

James Stewart Morris, Stuart Fla. Harvard Medical School Boston 1888 aged 76 died in April

Ira E. Sloan, Johnstown Pa., Baltimore Medical College 1892, aged 74, died February 6

### STATUS OF GASTRODUODENAL ULCER

*To the Editor*—I have been much interested in the editorial in THE JOURNAL April 25 entitled "Status of Gastroduodenal Ulcer." It emphasizes a point which has not been particularly stressed in recent years, namely the effect of hypersecretion and hyperacidity on the ulcer patient. The editorial strongly suggests and marshals evidence to prove that just such an increase in the acidity and secretion of the stomach predisposes to ulceration, prolongs the attack and favors recurrence. With this view I am heartily in accord.

It is probably true that gastroduodenal ulcer is primarily a medical problem, but I think that we may now add another surgical indication for duodenal ulcer—persisting hyperacidity and hypersecretion. By some this may be included under the heading of intractability, but, as intractability is a broad, general, nonspecific term, it would seem to be far more scientific and definite to recognize the pathologic-physiologic state of hyperacidity and hypersecretion. I feel that it should be thoroughly emphasized that no one should treat duodenal or gastric ulcer without being cognizant of the state of the gastric secretion in every given patient and, unhappily, this is frequently not the case. Just as the chest internist and thoracic surgeon should be interested in and familiar with the pulmonary secretions which are raised by the patient, just as the urologist takes the personal trouble and pains to inspect the urine by the two glass test and examine it microscopically on many occasions, so should the internist and the surgeon dealing with gastric disorders be personally familiar with the gastric secretion in all its aspects. By so doing they will greatly enhance their ability to evaluate and treat their patients.

In closing, may I thank you for your splendid editorial and reemphasize the essentials which Sippy taught for a number of years—that the surgical indications for duodenal ulcer are complications, namely acute perforation, massive hemorrhage, cicatricial obstruction and intractability, which should include persisting hypersecretion and hyperacidity.

JESSE P. EDDY 3D, M.D., Providence, R. I.

### TOXIC EFFECTS OF PHENYTOIN SODIUM

*To the Editor*—The article on the toxic effects of phenytoin sodium by Drs. Isidore Finkelman and A. J. Arieff, which appeared in THE JOURNAL, April 4, had been read before the Chicago Neurological Society at its October 1941 meeting. I had the privilege of discussing the paper at that time and I should like to take this opportunity of referring to some of the points included in that discussion.

Most physicians who have had experience with phenytoin sodium are well aware of its toxic properties, but it would seem, to me at least, that the toxic symptoms which may result from it are not as frequent or as severe as the authors have indicated. Merritt described mild toxic symptoms as having occurred in about 15 per cent of his patients and more severe toxic symptoms in 5 per cent. The usual toxic signs and symptoms encountered are ataxia, dizziness, staggering, diplopia, nystagmus, nausea and vomiting and, at times, a slight fever. These symptoms usually occur about the tenth day of treatment and in the majority of cases will disappear when the dose of the drug is decreased. After the disappearance of these symptoms administration of the drug may be resumed either in a reduced dose or, in many cases, in the original dose without the recurrence of toxic symptoms. The ability to manipulate and vary the dosage in the face of toxic symptoms is

probably the most important factor in reducing such symptoms and at the same time maintaining an effective anticonvulsant action. Some patients are not able to tolerate the drug even in very small doses, but fortunately such patients are rare.

The authors stated that "status epilepticus" was a toxic symptom of the ingestion of phenytoin sodium in some of their cases. After all, "status epilepticus" is a well known manifestation or symptom of epilepsy itself, and I do not see how the occurrence of such an outbreak can be attributed to phenytoin sodium just because the patient happens to be using the drug at the time. Certainly this condition occurs in patients who are being treated with other anticonvulsant drugs, and such drugs have not been accused of the responsibility. All know, furthermore, that "status epilepticus" may occur if phenytoin sodium is either suddenly withdrawn or substituted for another anticonvulsant drug which is suddenly withdrawn before the phenytoin sodium can be accumulated in the body. I should also question the statement that phenytoin sodium itself produced the peripheral neuritis which the authors listed as a toxic manifestation of the drug.

The authors referred to a case reported by Dr. Charles Aring and myself as illustrating the toxic effects of the drug (Ingestion of Large Doses of Dilantin Sodium, *Arch. Neurol. & Psychiat.* 45:265 [Feb.] 1941). A boy took large doses of phenytoin sodium (60 and 70 capsules, or 6 and 7 Gm.) over a short period (ten hours) as a suicidal attempt. True, severe toxic symptoms developed, but he recovered. The case thus illustrates the high safety factor of the drug.

The mild toxic symptoms encountered are well compensated by the striking and gratifying anticonvulsant action of the drug in many cases.

MILTON ROSENBAUM, M.D., Cincinnati

### TREATMENT OF TYPHOID CARRIERS WITH IODOPHTHALEIN

*To the Editor*—There appeared in a recent issue of THE JOURNAL (April 25, p. 1447) an article by Drs. Windsor C. Cutting and G. Bernard Robson entitled "Treatment of Typhoid Carriers." According to this paper, treatment of 5 typhoid carriers with soluble iodophthalein failed to cure the carrier state.

Although it is realized that the authors did not have knowledge of our recently published study (*ibid.*, March 21, p. 964), it appears that the reader of THE JOURNAL may be wrongly impressed with the value of such treatment. It is for this reason that we desire to make the following statements:

1 The iodophthalein treatment is not an all out cure of all typhoid carriers. Only a definite, well defined group of carriers will respond to treatment. These are carriers who present typhoid bacilli in their bile, as obtained by duodenal drainage, and a well functioning gallbladder, as determined by cholecystography.

2 Without first carrying out these two tests, treatment of typhoid carriers with iodophthalein appears irrational and unecological and may well bring the treatment into disrepute.

3 It is well realized that, the longer the typhoid carrier state persists, the more likely the gallbladder function will be found to be impaired. Furthermore, additional enteric foci may sometimes establish themselves in cases of long standing and excretion of bile. Therefore the iodophthalein treatment will be found of greatest value in carriers recently recovered from typhoid who have infected but otherwise not seriously damaged gallbladders.

## Medical Examinations and Licensure

### COMING EXAMINATIONS AND MEETINGS

#### BOARDS OF MEDICAL EXAMINERS

##### BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Examinations of boards of medical examiners and boards of examiners in the basic science were published in THE JOURNAL June 6 page 520

##### NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS *Parts I and II* Various centers June 22-24 *Part III* Various centers June or July Exec Sec Mr Everett S Ilwood 225 S 15th St Philadelphia

##### EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF DERMATOLOGY AND SYPHILIGOLOGY *Oral Groups 4 and B* Cleveland Jan 14-15 1943 Final date for filing application is Dec 7 *Written* Various centers Nov 16 Final date for filing application is Oct 5 Sec Dr C Chy Lane 416 Marlboro St Boston

AMERICAN BOARD OF INTERNAL MEDICINE *Written* Oct 19 Final date for filing application is Sept 1 Sec Dr William S Middleton 1501 University Ave Madison Wis

AMERICAN BOARD OF OPHTHALMOLOGY *Oral* Chicago Oct 9-10 Sec Dr John Green 6930 Waterman Ave St Louis

AMERICAN BOARD OF ORTHOPAEDIC SURGERY *Oral and Written* Chicago Jan 9-10 Final date for filing application is Nov 1 Sec Dr Guy A Caldwell 3503 Pryor St New Orleans

AMERICAN BOARD OF PATHOLOGY *Oral and Written* Richmond Va Nov 9-10 Final date for filing application is Sept 1 Sec Dr F W Hartman Henry Ford Hospital Detroit

AMERICAN BOARD OF PEDIATRICS *Written* Locally Sept 18 *Oral* Chicago Nov 23 Final date for filing application is July 1 Sec Dr C A Aldrich 707 Fullerton Ave Chicago

AMERICAN BOARD OF PSYCHIATRY AND NEUROLOGY New York December Final date for filing application is Oct 1 Sec Dr Walter Freeman 1028 Connecticut Ave NW Washington D C

AMERICAN BOARD OF UROLOGY If a sufficient number of applications are received an examination will be held in the east at the same time or shortly after one of the national meetings Sec Dr Gilbert J Thomas 1409 Willow St Minneapolis

### Minnesota January Report

The Minnesota State Board of Medical Examiners reports the written examination for medical licensure held at Minneapolis Jan 20-22 1942 The examination covered 12 subjects and included 60 questions An average of 75 per cent was required to pass Forty-three candidates were examined, 42 of whom passed and 1 failed Five physicians were licensed to practice medicine by reciprocity and 1 physician so licensed on endorsement of credentials of the National Board of Medical Examiners The following schools were represented

| School  | PASSED                  | Year Grad     | Number Passed    |
|---|-------------------------|---------------|------------------|
| Stanford University School of Medicine                            | (1939)                  | (1941)        | 2                |

## Bureau of Legal Medicine and Legislation

### MEDICOLEGAL ABSTRACTS

**Drunkenness Evidential Value of Chemical Tests—**The defendant was convicted of murder and appealed to the Supreme Judicial Court of Massachusetts During the trial of this case issue arose as to whether or not the deceased was drunk at the time of the altercation that led to his death The trial court admitted in evidence the testimony of a witness who had examined and determined the percentage of alcohol present in the brain blood and stomach contents of the deceased This witness testified that the amount of alcohol found in the deceased would cause the average normal man of 49, the age of the deceased to be definitely under the influence of liquor and to manifest some unsteadiness of motion On appeal, the defendant assigned as error the admission of this testimony

In the opinion of the court, it was not error to admit the testimony The witness, since his graduation, had been engaged in biologic and chemical research and for many years had been the chemist of the Boston police department, working in conjunction with the medical examiners and their associates He had worked on more than 140 cases for the department in matters involving blood stains and fibers and various problems relating to toxicology On many occasions he had qualified and testified in courts of the Commonwealth as an expert in chemistry and biology The record did not indicate the court said, that at any time during the trial the defendant questioned the qualifications of this witness Whether the witness possessed the qualifications adequate to enable him to testify as an expert rested in the first instance with the trial judge and his decision is conclusive unless it appears from the evidence to be erroneous as a matter of law Furthermore, the effect that a specified amount of alcohol found in a man's organs and bodily fluids would have on the steadiness of his gait was in the opinion of the court, a proper subject for expert testimony The opinions of experts as to the effect a certain amount of alcohol found by an analysis of the blood or urine would have on a person have been held competent in a number of cases

The court could find no error in the record and the judgment of conviction was affirmed—*Commonwealth v Capalbo*, 32 N E (2d) 225 (Mass, 1941)

**Medical Practice Acts Codification of Laws No Bar to Revocation of License for Prior Unprofessional Conduct—**In 1937 the legislature of the state of California enacted a Business and Professions Code thereby repealing the existing provisions of the medical practice act of 1913 Both the act of 1913 (section 14) and the Code of 1937 (section 2377), however provided that a physician who procured an abortion should be deemed guilty of unprofessional conduct in the practice of his profession On May 24 1939 a complaint was filed before the defendant state board of medical examiners charging the plaintiff with certain designated acts allegedly constituting unprofessional conduct in the practice of medicine in that on three specified dates he had violated section 2377 of the Business and Professions Code of 1937 The acts charged against the plaintiff were all committed prior to 1937 and at a time when the medical practice act of 1913 was in effect Accordingly the plaintiff filed a petition for a writ of mandate to restrain the board from holding any hearings on the complaint From a judgment granting the writ the defendant appealed to the district court of appeal, first district, division 1 California

The plaintiff contended that the legal effect of the adoption of the Business and Professions Code in August 1937 repealing the medical practice act was to prohibit the institution of disciplinary proceedings for any offenses committed prior to that date He further contended that this result followed even though the acts complained of constituted a violation of both the prior and the existing law The plaintiff admitted however that the Business and Professions Code merely codified existing provisions of law and neither intended nor attempted

to change any of the substantive provisions of the medical practice act. It is a general rule of law, said the district court of appeal, that "When a statute, although new in form, reenacts an older statute without substantial change, even though it repeals the older statute, the new statute is but a continuation of the old." This rule is especially applicable to the codification of statutes and no saving clause, or other expression of legislative intent, is necessary. Consequently the court held that, independently of a saving clause, a person may be prosecuted under a repealed and reenacted statute, even though the offense was committed prior to the date of the reenactment.

The Business and Professions Code, however, contains a saving clause. Section 2 provides:

The provisions of this code in so far as they are substantially the same as existing statutory provisions relating to the same subject matter shall be construed as restatements and continuations thereof, and not as new enactments.

Section 4 provides:

No action or proceeding commenced before this code takes effect, and no right accrued, is affected by the provisions of this code, but all procedure thereafter taken therein shall conform to the provisions of this code so far as possible.

The plaintiff contended that section 2 was a general statute and that section 4 was a special statute, that a special statute controls a general one and that therefore only actions actually commenced and rights actually accrued under the medical practice act were saved. In other words, the plaintiff's argument was this: Without any saving clause the plaintiff could be prosecuted, with only section 2 the plaintiff could be prosecuted, with sections 2 and 4 the plaintiff could not be prosecuted because, by specifically saving actions commenced and rights accrued, the legislature impliedly prohibited all other prosecutions. The district court of appeal said that, whenever possible, all the provisions of a statute must be reconciled. No repugnancy existed between sections 2 and 4, continued the court, if section 2 was construed as a saving clause where no substantial change was made in the law and section 4 was construed as a saving clause in case some future legislature amended the law in some substantial manner. The plaintiff's argument completely abrogated section 2 and attributed to the act a meaning which the legislature did not intend. Said the court:

We cannot believe that the legislature was so solicitous of doctors who had violated their responsibilities to the public and who had been false to their trust, that it intended to abrogate all prosecutions for offenses committed prior to the codification of the law. It is much more reasonable to assume that no such intent existed.

The judgment appealed from in favor of the plaintiff was accordingly reversed.—*Sobey v Molony et al*, 104 P (2d) 868 (Calif, 1940)

**Dental Practice Acts. Validity of Restrictions on the Operation of Chain Dental Parlors.**—Those provisions, said the Supreme Court of Washington, of the Washington dental practice act, which prohibit any person from conducting a dental office in his name or advertising his name in connection with any dental office or offices unless he is personally present in such office operating as a dentist or personally overseeing such operations as are performed during a majority of the time such office or each of such offices is being operated constitute a valid exercise of the police powers of the state and do not infringe on the equal protection and due process clauses of either the state or the federal constitution.

A statute enacted pursuant to the police power of the state cannot be held unconstitutional if it reasonably tends to protect the public welfare from a threat or menace of evil, even though the law operates to deprive a citizen of the right which he might otherwise enjoy to maintain a business, pursue a profession or endeavor to gain a livelihood, in the manner proscribed by law. The modern tendency of the courts is to restrict the authority of the legislature acting pursuant to the police power only when it clearly appears that constitutional rights are violated and courts will not interfere with the exercise of the legislative authority unless the statute should be held arbitrary and without a reasonable relation to any evil sought to be corrected or guarded against. In passing on the constitution-

ality of a statute enacted pursuant to the police power, it is not necessary that the court find the existence of a state of facts which would justify the particular statute in question, it is sufficient if it is deemed within the bounds of reasonable possibility that such a state of facts may exist. The safeguarding of the public health, and particularly the residents of the state as individuals, from the evils of incompetent and improper dental practices is beyond question a justifiable exercise of the police power of the legislature.

The provisions of the statute herein questioned must be considered with reference to the entire act of which it is a part. It may be presumed that, in the opinion of the legislature, the conduct of a dental office under the name of one who, although a licensed dentist, was not personally present in the office a majority of the time was a pernicious practice, tending to mislead persons patronizing such office in the expectation that the services sought and paid for would be personally rendered or supervised by the dentist whose name is held out to the public as conducting the office. It cannot be held that the legislature was mistaken in acting on that premise. The relationship between dentist and patient is inherently personal in the highest degree. Certainly it is within the province of the legislature to protect the public against all forms of fraud and deception tending to conceal the professional identity of the dentist who is in fact rendering the service in the particular office frequented by one in need of dental assistance. By the practice denounced by the act, the public may be unwittingly deprived of a personal relationship which may rightfully be expected and have another personality substituted therefor. The use of the name of a certain dentist as conducting an office for the practice of dentistry should mean something more than merely physical ownership of the office or the right to use the name, which may have a value because of long continued use or commercial advertising. It may well be that in respect to a particular individual the operation by him of more than one dental office would result in no harm to the public. The legislature, however, is entitled to consider and deal with the general problem of the commercial exploitation of the dental profession. If in the opinion of the legislature chain office dentistry and dental offices conducted under corporate or fictitious names, or under the name of a dentist who has nothing to do with the practice of the profession in connection with the carrying on of the office, tend to introduce into the profession unscrupulous practices which tend to lower the ethics and standards of the dental profession, to the injury of the health of the community and the public welfare, the legislature has the power to place the limitation in question on the general practice of the profession, even though in certain cases the act forbidden might not result in any of the evils which was believed might follow from the frequent employment of the forbidden practice.

The Supreme Court, accordingly, refused, in effect, to restrain the director of licenses of the state from preventing the plaintiff, a licensed dentist who operated a dental office under his own name in Seattle, from opening and operating, also under his own name, another office in Tacoma.—*Campbell v State*, 122 P (2d) 458 (Wash, 1942)

## Current Medical Literature

### AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1932 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (\*) are abstracted below.

- Nutritional Edema in Children. Ji Chen, Shanghai, China—p. 552.

**Toxoplasmic Encephalomyelitis.**—Paige and his associates report 3 cases of infantile toxoplasmic encephalomyelitis and record the finding of *Toxoplasma* in reexamined sections of the brain in a previously reported case of chronic acquired hydrocephalus with meningoencephalitis of undetermined cause. The first patient with toxoplasmic encephalomyelitis, a white female slightly premature infant who died at 9 weeks, was noticed, two hours after birth, to have a progressively increasing hydrocephalus. Cerebral calcification was present on the sixth day, microphthalmos and membranous masses in the vitreous of each eye during the second and third weeks of life. The spinal fluid showed xanthochromia and a high protein content and there were tremors and convulsions late in the course. Necropsy revealed a diffuse necrotizing encephalomyelitis with many granulomas and extensive calcification. *Toxoplasmas* were present in the lesions of the brain, spinal cord and eyes, and mice inoculated with cerebral tissue acquired a typical murine toxoplasmosis. The second case establishes the fact that the infantile form of the infection may be prenatal in origin. The infant had given evidence of hydrocephalus in utero necessitating craniotomy for delivery. The child, born at term, was normally developed except for the enlarged head and was viable up to the time of delivery. On pathologic examination the stillborn child presented an advanced toxoplasmic encephalomyelitis with extensive calcification of the lesions and an associated chorioretinitis. *Toxoplasmas* were found in the cardiac and striated muscle fibers and in cells of the adrenal cortex. The third patient, who died at 3½ days of age, is of interest because of the widespread involvement of organs other than the nervous system and the less advanced state of the neural lesions. Necropsy revealed *toxoplasmas* in the lungs, heart, brain, adrenals, ovaries, thyroid, striated muscles and adipose tissue. These had given rise to interstitial pneumonia, to acute diffuse myocarditis, to encephalomyelitis characterized by focal necrotizing and inflammatory lesions and many granulomas and to

focal lesions in the adrenals and ovaries. In the other organs in which they were present, the parasites produced no reaction. Diagnosis should be rendered possible during life by the following data: (1) onset of symptoms at birth or early infancy, (2) varied neurologic symptoms, (3) chorioretinitis, (4) roentgen demonstration of intracerebral calcification, (5) determination of clinically inapparent internal hydrocephalus by pneumoencephalography, (6) xanthochromia, round cell pleocytosis and high protein content of the cerebrospinal fluid, (7) recovery of *toxoplasmas* from the blood or cerebrospinal fluid by inoculation of mice and/or rabbits and (8) demonstration of *Toxoplasma*-neutralizing antibodies in the blood of the infant or of the mother.

#### Autohemolytic Anemia with Autoagglutination—

Reiser and Kalkstein encountered a case of acute hemolytic anemia apparently due to the spontaneous action of autohemolysis within the body. The case fulfilled the criteria for such a diagnosis. There were icterus, anemia, hemoglobinuria, microcytosis and definite evidence of new blood formation with reticulocytosis. There was no evidence of parasitic infestation or of exposure to a toxic agent which could cause the anemia. Therefore the case is regarded as one of acute hemolytic anemia due to the spontaneous action of some intrinsic factor, an auto-antibody. Autohemolysis, which was undoubtedly active, could not be demonstrated in vitro owing to the overwhelming presence of an autoagglutinin whose action persisted at body temperature and it could not be split off from the erythrocytes. The unusually high titer of the agglutinin was probably due to repeated transfusion reactions with hemolysis of blood and liberation of more antigen. The factor that precipitated the initial hemolysis remains unknown but a vicious circle was established: the hemolysis necessitated transfusion which in turn led to increased hemolysis. The only treatment that could break this cycle was splenectomy. This proved correct as the patient was given transfusions without a reaction in spite of a persistently high autoagglutinin titer. This also suggests that the spleen was the actual site of hemolysis. Fifty-four cases of autoagglutination are reported in the literature.

**Chronic Leukemia**—Hornbaker reports 3 cases of leukemia in 3 sisters in an unusual combination in 2 of them it was of the lymphatic and in 1 of the myelogenous type. The history of the remainder of the family (parents, other siblings and the patients' children) does not reveal or suggest a blood dyscrasia.

**Normal Plasma Coagulation Time**—Cheney determined the coagulation time of the plasma of 340 normal adults and of 107 patients with nonhemorrhagic disorders to test the serviceability of the test for vitamin K deficiency. A clean venipuncture must be performed, and the blood withdrawn must be rapidly transferred to a test tube containing a weighed amount of dry potassium oxalate in the ratio of 10 mg to 5 cc of blood. The oxalate must be thoroughly mixed with the blood by inverting the corked tube ten or fifteen times. The oxalated blood is centrifuged in a constant speed centrifuge at 3,500 revolutions per minute for five minutes, and the plasma is pipetted off and then 0.2 cc of the plasma is pipetted into each of two small chemically clean test tubes and 0.2 cc of 0.4 per cent calcium chloride is added to the first tube and 0.1 cc to the second. The tubes should be shaken gently five to ten times. The coagulation time of the plasma should be read in minutes. The end point is taken when the solution no longer flows when the test tube is held horizontal. The shortest time of coagulation for the two tubes is the plasma coagulation time. The room temperature at the time the test is carried out should be recorded, a variation between 23 and 26 C causes no gross variation in the test. The test should be completed within the first hour after the venipuncture. The results of the plasma coagulation time of the 340 normal individuals show that clotting occurs in 86.35 per cent in four to seven minutes, the average for the group was five and one-fourth minutes. The trend for the curves for the 107 patients with nonhemorrhagic disease is similar with few exceptions. The short time of two minutes was more than twice (four as against five in the normal group) as common and a prolonged coagulation time above the normal upper limit of eight minutes in 6 patients as against 17 normal controls. Of 2 patients with times of nine minutes, 1 was suffering from prolonged malnutrition and 1 was receiving sulfanilamide therapy for a streptococcal sore throat, 1 patient with a time of ten minutes suffered from severe allergy, 1 with a time of twelve minutes had chlorotic achlorhydric anemia and 2 patients with a time of thirteen minutes were malnourished. It is evident that occasionally a patient may have a disturbed plasma coagulation time without evident hepatic or biliary tract disease, hemophilia or purpura. The constancy of the results warrants the use of the plasma coagulation time as a simple laboratory test, provided the physical conditions are closely adhered to.

**Pneumococcal Capsular Polysaccharide**—Gara and his associates record studies on the diagnostic and prognostic significance of pneumococcal capsular polysaccharide and of agglutinative and precipitative antibodies in 44 specimens of pleural exudate from 27 patients with pneumococcal pneumonia. The observations were correlated with other bacteriologic, immunologic and clinical data. An attempt was made to determine the type of pneumococcus responsible for an illness by identifying with pooled serums the specific capsular polysaccharide in the pleural exudate. The results indicate that the detection of capsular polysaccharide in "sterile" pleural effusion may reveal the pneumococcus type involved. The mortality rate for the group was 29.7 per cent, or 8 deaths, in 6 of which capsular polysaccharide was detectable. This indicates the desirability of performing various tests on body fluids, because capsular polysaccharide may be found in the blood when no organisms can be detected. Twenty-four pleural exudates from 16 patients were positive on culture and contained detectable capsular polysaccharide but no antibody. Capsular polysaccharide was found in 6 sterile pleural fluids from 4 patients. On one occasion the pleural culture was positive. Fourteen fluids from 9 patients were negative on culture and contained no capsular polysaccharide, in 8 of these fluids (from 4 patients) antibodies could be detected. More recoveries (8 of 11) occurred in thoracotomized patients who had had bacteremia than in those given repeated thoracenteses (11 of 16). The blood, pleural exudate and urine of 9 patients were studied for capsular polysaccharide, and it was detectable in 7 pleural exudates, in 5 urines after

concentration and in 2 bloods. Pooled serum was satisfactorily used for the detection of capsular polysaccharide in pleural exudates. The same optimal concentrations of antibody are used for detecting capsular polysaccharide in the pleural exudate as are used for urine, broth and plasma.

**Deaths Following Therapeutic Malaria**—Since 1925 there have been 29 deaths among the 1,026 patients with neurosyphilis submitted to inoculation malaria. The deaths occurred during or immediately after the paroxysms. Wile and Mundt point out that sudden peripheral circulatory failure or vascular collapse accounted for 12 of the deaths. The collapse was unpredictable, it appeared early in the course of paroxysms in some patients and toward the end of the fever in others. Necropsies were performed on 6 of these patients and, except for 1 patient who had syphilitic heart disease with an aortic aneurysm, nothing was found to account for death. The death of 5 patients could be attributed either directly or indirectly to extreme hyperpyrexia. Five patients died from pneumonia confirmed by clinical signs and roentgen study. Only 1 other patient died from an intercurrent acute infection, erysipelas, which developed at the puncture site at which typhoid bacilli were injected intravenously. The death of 1 of the remaining patients was due to cerebral thrombosis, of 2 to internal hemorrhagic exsanguination, of 1 to suicide and of 1 to respiratory failure with convulsions.

**Treatment of Early Syphilis by Massive Dose Method**—Since November 1939 Berry has treated 50 patients within three months of acquiring syphilis with massive dose of mapharsen. He has found it convenient to dissolve 60 mg of mapharsen in a 500 cc flask of distilled water, to which is added a 50 cc ampule of 50 per cent dextrose. This is given in about three hours by continuous drip. Four such doses constitute the day's treatment. The patient is given a carbohydrate diet and encouraged to take fruit juice. The treatment has usually been well tolerated. Nausea in 31 per cent, associated with vomiting in 30 per cent, was the most frequent disturbance. One treatment may not give a cure, and prolonged follow-up is just as important as the methods of treatment. Unfortunately many of the early failures

were soldiers who are now overseas. However, the author knows that 2 of them who were seronegative became positive during treatment but reverted to negative and were still negative six months later. A third patient who was seronegative remains so a year after treatment. A close follow-up was maintained of 19 patients with secondary syphilis all of whom were treated more than six months ago. Ten of these became negative after six weeks and all except 1 were negative after three months and have remained so to date. Five patients have now been under observation for more than a year and 1 treated in November 1940 is still seropositive and must be considered a treatment failure. Although sufficient time has not elapsed to determine the permanence of serologic reversal the author feels certain that the massive dose method constitutes a real advance in the treatment of syphilis. Although its present form may not be accepted, some modification of it will become the treatment of choice for early syphilis.

**Treatment of Neurosyphilis**—According to Marin artificial fever therapy combined with chemotherapy and vaccines as an adjunct for inducing hyperpyrexia has been given to 265 patients with no deaths. Of 58 patients with dementia paralytica 46 per cent obtained a complete remission. Nine of 22 patients with tabes were definitely improved as were 6 of 9 with tabes and dementia paralytica. Of 7 patients with meningovascular neurosyphilis, 3 recovered and 1 was improved. Of 173 patients who received one complete course of hyperpyrexia, vaccines and chemotherapy, the spinal fluid became immediately negative in 6 (4 per cent). Of 84 patients who subsequently received twelve months of chemotherapy (following artificial fever) the spinal fluid became negative in 17 per cent. Of 34 patients treated for twenty-four months with chemotherapy following the hyperpyrexia course, the spinal fluid became negative in 18 per cent. The spinal fluid of 3 of 9 patients treated for three years has become negative.

**Early Skin Grafting for War Wounds of Extremities**—Converse believes that many complications following extensive skin losses with their consequent delay in the patient's return to work or duty could be prevented by the early replacement of lost skin by grafting. When a considerable loss of superficial tissue exists healing may be incomplete and of poor quality. When bone is exposed through the loss of superficial covering and periosteum it becomes devitalized and sequestered and is open to infection and osteomyelitis. A tendon left uncovered is destined to slough. The pathologic picture of an unhealed wound is one of gradually diminishing blood supply, progressive increase of fibrous tissue and retarded epithelial growth. This can repeat itself indefinitely. Therefore the rapid covering of a wound by epithelium appears desirable. Skin

grafting is indicated when the cutaneous loss is such that function may be impaired when spontaneous healing appears improbable and when rapid healing is desirable. Skin grafting makes secondary nerve suture or grafting, tendon suture or bone surgery possible earlier. One hundred and ten skin grafting operations were performed two to nine months after injury on infected granulating wounds. Aside from the technical details of fixation and adequate pressure, wound infection which creates suppuration and wound fibrosis which diminishes the local blood supply influence the success of skin grafting. Therefore, particularly in older wounds, it seems preferable to excise the wound whenever possible to obtain a vascular base for the graft. When secondary wound excision was done the occurrence of skin graft take was 88 per cent in 54 cases. (A complete take was spoken of as 100 per cent.) When this was not done the occurrence of skin graft take was 52 per cent in 56 cases. In 22 instances of the latter group the granulating layer was superficially excised or scraped, exposing the fibrous layer before grafting, and in these cases the skin take was 68 per cent. Skin grafting is generally unsuccessful when acute hemolytic streptococcus infection is present. By the local use of chemotherapy it has become possible to obtain wounds free from streptococci within a few days when skin grafting is possible. Eighty-one of the 110 patients with granulating wounds harbored hemolytic streptococci at some time. Wounds containing *Bacillus pyocyaneus* should be excised before grafting is attempted. The staphylococcus influences the take only in proportion to the amount of exudate present in the wound. When secondary debridement, that is, excision of the whole wound, is not possible the wound must be freed from suppuration and good local circulation brought about by other means such as moist dressings, the Bunyan envelop, firm elastic pressure, avoidance of the dependent position and complete immobilization. Skin grafts are not successful over bone deprived of periosteum. In such cases it is necessary to cover exposed structures with a flap of skin consisting of subcutaneous tissue and fat. The immediate covering of tendon is imperative to prevent sloughing.

**Gastric Polyposis**—Heeks and Gibb report the occurrence of gastric polyposis in a woman of 35 whose condition was diagnosed as gastroscopy and confirmed at operation. The patient's chief complaint for nine years was epigastric pain one hour after eating. Alkalis gave no relief. Dietary regimens, which she did not conscientiously follow, gave temporary relief. A bland diet and bismuth and soda powders gave prompt relief. On gastroscopic examination the rugae of the entire posterior wall extending distally to the angulus were finger-like in size, velvety, finely nodular and congested resembling cerebral convolutions. At operation the stomach was seen to be hypertrophied. An indurated, whitish spot on the anterior surface of the duodenum proved to be a chronic ulcer. When the stomach was opened, the mucous membrane of the posterior wall was found to be hypertrophied and lying in succulent folds. There was no evidence of carcinoma or of metastasis. After partial gastric resection a retrocolic Polya type of gastrojejunostomy was performed. Microscopically a portion of the normal mucous membrane of the stomach and also the tall, branching and overhanging rugae simulated a papillary adenomatous growth. The patient made excellent progress and when last seen, one year after operation, she felt fine, had no gastric symptoms and had gained 14 pounds (6.3 Kg.).

**Celiac Ganglion and Hypertension**—There are three surgical concepts (hyperepinephrinemic, neurogenic and hereditary) of the etiology of essential hypertension and consequently three surgical approaches. Cantor proposes to determine the validity of the last concept that of Crile, who states that 'only those individuals who have by inheritance large celiac and aortic ganglia can and do have hypertension,' by testing the relationship of the size of 201 celiac ganglions to essential hypertension. The left celiac ganglion was larger than the right sometimes two to three times as large. Most of the large ganglions weighing around 1,000 mg or more were obtained from patients with a blood pressure well within the normal range. The ganglions from hypertensive patients actually weighed somewhat less. The largest ganglion weighed 2,100 mg and was found in a non-hypertensive individual whereas the largest ganglion found in

a hypertensive individual weighed 1,250 mg. Both of these ganglions were on the left side. The largest right celiac ganglion from a nonhypertensive subject weighed 1,950 mg, while the heaviest right celiac ganglion from a hypertensive patient weighed 1,225 mg. The average weight of the left celiac ganglion from nonhypertensive subjects was 968.4 mg and for the right it was 745 mg, and the average weight for the ganglions from hypertensive patients was respectively 867.9 and 674.4 mg. The celiac ganglions increase in size from birth until the age of 40 to 55. After this their weight declines gradually until in the octogenarian their weight is near the childhood level. The largest ganglions were found in the male sex. Apparently there is no relationship between the weight of the celiac ganglions and essential hypertension.

**Mustard Gas Injuries to Eyes**—The present treatment of ocular injuries due to mustard gas—dichlorodithylsulfide—Hughes states, is largely symptomatic, it helps prevent the development of secondary complications. By opening the swollen lids the patient can be assured that he is not blind. Local anesthetics should be avoided, however, if necessary for examination, 1 drop of a 5 per cent isotonic solution of pontocaine may be instilled. The eye should be irrigated for two minutes with a 1.5 per cent solution of sodium bicarbonate, isotonic solution of sodium chloride, a 2 per cent solution of boric acid or a 0.5 per cent solution of dichloramine-T in chlorinated petrolatum. For patients with corneal involvement or extreme photophobia a 1 per cent atropine solution or ointment should be instilled every day until the symptoms subside. When the involvement is severe, drops or an ointment of liquid petrolatum, cod liver oil with added sodium bicarbonate and dextrose or acriflavine in castor oil 1:15,000 should be instilled three times a day. Dark glasses or a brown eye shade should be used, but only for a short time. Bandages or eye pads should be avoided. Finally a 10 per cent mild protein silver solution, followed by irrigation with boric acid solution, should be instilled three times a day. A 0.25 per cent solution of zinc sulfate with epinephrine should be used during convalescence. As yet no satisfactory neutralizing agent for mustard gas that is tolerated by the eye is available, therefore as soon as the faint, transitory mustard or garlic odor is detected or the presence of mustard gas is suspected the gas mask should be put on. In addition to wearing gas masks, workers in England's mustard factories should irrigate their eyes several times a day with sodium bicarbonate or boric acid solution. The oily secretion of the meibomian glands and the moist surfaces of the conjunctiva and cornea make the eye all the more sensitive to the vapor of mustard gas. In field dressing stations, attendants should don gas respirators before decontaminating patients and their clothes.

**Sulfathiazole Emulsion**—A liquid emulsion made up of 5 per cent of finely powdered sulfathiazole, 2 per cent of triethanolamine, 24 per cent of water, 5 per cent of beeswax and 64 per cent of liquid petrolatum was used by Ackman and Wilson in 25 cases in which curtain drainage was required (for wounds, abscesses, carbuncles, open amputations and ulcers), in 19 cases of burns and for vaginal packing as an adjunct to surgery. The results in all instances were most gratifying. To get the best results from curtain drainage packing gauze impregnated with the emulsion should be packed tightly into the interstices of the depths of the cavity of the abscess or wound and from this point less tightly toward the surface so that the packing does not act as a cork. Slow continuous drainage with bacteriostatic action is thus provided. The removal of a pack may be delayed for a number of days, during which time there is little or no odor. There is no undesirable caking or crusting. The use of sulfathiazole emulsion for burns is advocated because it meets with the requirements of flexibility and bacteriostatic action. The dressings absorb secretions, do not require frequent changes, are soothing and, because they are soft and nonadherent, they cause little pain on removal. They are relatively odorless and cause minimal bleeding when changed. The progress of healing may be viewed easily, as the burned area is clean and not macerated. In using the sulfathiazole emulsion pack in gynecologic surgery the vagina is packed in much the same way as with acriflavine gauze. The vagina should be free of alcohol before it is packed with sulfathiazole. The effect of the drug probably lies in its early application, postoperative fever due to infection at the operative site has been reduced, and healing has not been retarded. The pack does not cake or dehydrate the vagina, and there is no odor from the vagina or the removed pack.

**Parathyroid Insufficiency in Wilson's Disease**—Altschul and Brown report the occurrence of hepatolenticular degeneration in 4 brothers. In 2 there was evidence of parathyroid insufficiency. The order in which the patients were affected was the oldest first, the second after him and then the fourth in whom the progress of the disease was so rapid that his death preceded that of the second brother, and finally the third brother, who shows typical signs of parathyroid insufficiency. The first brother had signs of lenticular disease but no symptoms of a diminished function of the parathyroids. While in the 3 older brothers the renal symptoms were predominant, the symptoms in the youngest were only those of a hepatic cirrhosis, although at present alterations of the lenticular nuclei and their surrounding structures are present. This case differed from the others and from the clinical picture in that clinical symptoms due to hepatic disease are unknown in Wilson's disease. Nevertheless the family

tory and the observations at necropsy justify such a diagnosis. The symptoms in the 3 older brothers indicated a pathologic condition of the pyramidal tract and in the second oldest brother microscopic investigation revealed a status spongiosus affecting the internal capsule; thus the pyramidal symptoms were explained. The anatomic changes in the central nervous system differed greatly and were not completely in accord with the clinical changes. The symptoms in the third brother developed in a fairly regular course first the head then the upper and finally the lower limbs. This might point to a body localization in the lenticular nucleus and its regular, gradual involvement.

**Mold Fungi**—The results of a two year survey of the air borne molds in central and southwestern United States reported by Morrow and her associates emphasize the universal distribution of air disseminated molds, regardless of geographic location, season or climate. Molds were actually recovered at one of the northern stations immediately after a heavy snow and following several days of near zero weather. High mold counts were found not only at Houston, Galveston and Toledo where coastal and lake conditions might be conducive to mold growth, but also at San Antonio, Abilene and Kansas City, Mo. Certain species, *Aspergillus* and *Penicillium*, although relatively low, occur so commonly and consistently as to be designated cosmopolites. Others, *Alternaria* and *Hormodendrum*, although recovered more frequently on the basis of yearly occurrence than any other genera exhibit such a variation in incidence as to be reflected in the regional and seasonal trends of the totals. Still others, *Pullularia*, exhibit neither regional or seasonal trends nor consistency in occurrence but appear so suddenly that they definitely affect the totals for a single count. This is in contrast to the concept that *Alternaria*, *Helminthosporium*, *Spondylocladium* and *Hormodendrum* are encountered most commonly and consistently.

**Air Borne Fungus Spores**—Bernstein and Feinberg state that a daily study of the mold content of the air in the Chicago area for a continuous period of five years revealed that *Alternaria* and *Hormodendrum* constituted 72 per cent of all the spores grown on artificial mediums. Some fungi show no particular seasonal tendency but fungi that have a high incidence display decided seasonal fluctuations. The seasons for the various fungi vary, as does the length, time of onset and termination from year to year. Such definite variations usually are not observed for pollen seasons.

**Asthma and Carcinoma of Bronchus**—The data on 3 patients who complained primarily of asthma but who also had an associated primary bronchial malignant growth are reported by Prickman and his co-workers, as they illustrate some of the features of concurrent asthma and primary bronchial carcinoma. The study emphasizes the importance of a careful and complete examination of all patients with asthma and the necessity for bronchoscopy. Recurring hemoptysis among asthmatic patients, although it may be associated with severe cough, should always suggest the possibility of a neoplasm or some other organic pulmonary disease. Recurring chills and fever or fever alone in asthma should suggest the possibility of bronchostenosis with retained secretions, and this condition may be caused by inflammation or by a neoplasm. Persistent impairment of breath sounds, with or without impairment of the percussion note, justifies bronchoscopy of any patient with asthma. Bronchoscopy is indicated when infiltrating lesions at the pulmonary hilus are demonstrated roentgenographically. The symptoms caused by carcinoma of the bronchus in some persons can be and are mistaken for those of asthma.

**Thiamine Metabolism**—In the belief that measurement of the circulating level of thiamine is preferable to that excreted in the urine, Gorham and her associates used the ultramicro technic of Atkin Schultz and Frey to determine the thiamine in the leukocytes or erythrocytes. The method also makes it possible to measure the thiamine and the pyrimidine capable of accelerating yeast fermentation. The average thiamine level of the normal leukocytes (998 micrograms per hundred cubic centimeters) was about ten times that of the normal erythrocytes (103 micrograms per hundred cubic centimeters). The study would indicate that in the course of its metabolism thiamine is broken down to the pyrimidine accelerating yeast fermentation compound. The intravenous administration of thiamine to normal individuals is followed by a significant increase in the concentration of the pyrimidine accelerating yeast fermentation compound in the blood cells and urine. The mere presence of thiamine is not enough to account for the simultaneous production of pyrimidine accelerating yeast fermentation. Until the pyrimidine accelerating yeast fermentation normally found in blood and urine can be isolated and administered, no conclusion can be drawn as to its ability to produce thiamine in man.

a hypertensive individual weighed 1,250 mg. Both of these ganglions were on the left side. The largest right celiac ganglion from a nonhypertensive subject weighed 1,950 mg, while the heaviest right celiac ganglion from a hypertensive patient weighed 1,225 mg. The average weight of the left celiac ganglion from nonhypertensive subjects was 968.4 mg and for the right it was 745 mg, and the average weight for the ganglions from hypertensive patients was respectively 867.9 and 674.4 mg. While in the 3 older brothers the parathyroid symptoms were predominant, the symptoms in the youngest were only those of a hepatic cirrhosis, although at necropsy alterations of the lenticular nuclei and their surroundings were present. This case differed from the others and from the clinical picture in that clinical symptoms due to hepatic disease are unknown in Wilson's disease. Nevertheless the family

to replace normal menstrual losses. As the intake level rose from below 8 to 16 mg, negative balances decreased and the amount of iron stored increased. Seven subjects whose diets were generous in other nutrients had an average daily iron intake of 7.21 mg and stored 155 mg daily. Five other subjects with similar iron intakes but otherwise suboptimal diets had an average daily negative balance of 1.3 mg. It appears that emphasis should be placed on obtaining diets optimal in other essential nutrients rather than iron alone, known to function in efficient iron absorption and utilization.

**Staphylococcal Pneumonia in Infants.**—Pneumopyothorax occurred in 4 of 6 infants with staphylococcal pneumonia that Clemens and Weens encountered in sixteen months. The pneumonia was bronchiogenic in type and usually followed an infection of the upper respiratory system including the nasal accessory sinuses and the middle ear. The pneumopyothorax occurred before any diagnostic or therapeutic thoracentesis was performed. Early empyema occurred in all the infants. Frequent roentgen examination, especially in the erect position, is the most valuable aid in the early diagnosis of the complications. The clinical course is characterized by sudden onset with high fever, rapid respiration and cough. From the onset and through the entire course of the illness (to death) the patients appeared toxic. Stupor and unconsciousness were observed in the terminal stages. A drop in temperature was not always followed by an improved clinical condition. A sudden turn for the worse, indicated by cyanosis, hyperpyrexia, an increase in cardiac and respiratory rates and the vomiting of dark brown material, should suggest pneumopyothorax. Staphylococci in large numbers were found in the empyema fluid from the 6 infants. Pulmonary abscess was found in the 3 patients on whom necropsy was permitted. The centers of the abscesses contained necrotic material and frequently dense masses of staphylococci. The remainder of the pulmonary parenchyma showed a tendency to localized suppuration. Complete pneumothorax was prevented by the formation of adhesions between the parietal and visceral pleura. Therapy (chemotherapy, staphylococcus antitoxin, surgical procedures, blood transfusion and fluid balance by intravenous and subcutaneous administration of dextrose) might have been more favorable had it been instituted earlier, that is before adhesions which facilitated the retention of pus had formed. The cause of death seemed to be the overwhelming toxemia and the change of the intrathoracic pressure in the patients in whom pneumothorax developed.

**Outbreak of Tuberculosis Due to Hospital Infection.**—A recent hospital outbreak of miliary tuberculosis among infants resulted from their being exposed to a nurse with open tuberculosis. The nurse had been employed at the hospital from March 15, 1939 to Jan. 30, 1940; her duties included all care of infants in the nursery from 11 p. m. to 7 a. m. A total of 506 infants were born at the hospital during her employment

there, and of the 426 that were tested later 26 reacted to the Mantoux test. This gives a reaction rate of 6.1 per cent, which is three times the rate found among children (with a mean age of  $2\frac{1}{2}$  years) tested in Massachusetts Well Baby Clinics. Of the 26 infants who reacted to the tuberculin test, 7 presented roentgen evidence of tuberculosis. Two died of miliary tuberculosis and the diagnosis was confirmed at necropsy, and 2 other reactors were subsequently admitted to the Children's Hospital, Boston, 1 with a diagnosis of pulmonary tuberculosis and 1 with a diagnosis of tuberculous tracheobronchial nodes with atelectasis. Both recovered. The remaining 3 infants showed enlargement of the tracheobronchial lymph nodes, which is characteristic of tuberculosis, but symptoms of the disease have not developed. Active tuberculosis was not found in any member of the families of the 7 infants. Lack of interest on the part of parents has made it impossible to secure many retests, and only 10 of the reacting children were brought in for roentgen study a year later, March 1941. At that time none showed any evidence of pulmonary disease. Two facts are emphasized by Pope: babies can be infected with tuberculosis during the earliest days of life, and such infection in certain cases tends to progress rapidly and often ends fatally. The diagnosis of tuberculous meningitis or of generalized tuberculosis in an infant or child should initiate an immediate and intensive search for the source of infection.

**Pertussis Treated with Pertussis Antigen.**—Pertussis broke out among 36 children from 3 to 9 years of age occupying one department of a home. The 36 children were divided into three groups: 14 received detoxified pertussis antigen, 11 were not treated and 11 had had the disease before. The study reported by Kramer lasted seven weeks. There was no reduction in the number of paroxysms of coughing immediately after the injection of the antigen, nor was the severity or the length of the disease influenced. The course of the disease in the control group was approximately the same as in the treated group. Some benefit might be claimed for 7 patients who received five injections of pertussis antigen at the beginning of the disease, the course of the disease in them was five and a half weeks as compared to seven weeks in the 7 patients who did not receive treatment until the twelfth day of the disease. However, 4 control children had a similar abbreviated course. The children who previously had pertussis did not contract the disease even in a mild form. Tabulation of the time at which the paroxysms occurred shows that two thirds of the coughing spells occurred between 7 p. m. and 7 a. m. and that the maximal intensity of coughing in pertussis occurred during the early hours of the night.

**Sulfaguanidine for Enteric Infections.**—Of 30 patients moderately to severely ill with acute bacillary dysentery, Hall treated 15 with sulfaguanidine and used 15 as controls. The results in 13 of the treated patients were excellent, fair in 1 and failure (death on the ninth day) in 1. The response was just as dramatic and spectacular as that obtained with sulfathiazole and sulfapyridine in pneumococcal pneumonia. The temperature usually dropped to normal in twenty-four hours, and the general appearance of the patient changed from that of an acutely ill child to one who hardly looked ill in forty-eight hours. When treatment was instituted early a definite decrease in toxicity and a slowing down of the stools usually occurred in as short a time as twelve hours. In all but 3 patients the temperature returned to normal in twenty-four hours. Generally the course of the disease in the control patients was that observed in the past with two exceptions: 1 patient died from an overwhelming toxemia sixty hours after the onset of illness and 1 patient made a rapid recovery after an onset which would ordinarily indicate a virulent infection. The course of the illness of 5 patients with typhoid treated with sulfaguanidine was essentially unchanged by the drug as was a *Salmonella* gastroenteritis in 1 patient. Few toxic effects were observed among the 21 treated patients. Nausea was observed twice, headache once and conjunctivitis once. Sulfaguanidine was not given for longer than twelve days to any patient.

**Mediterranean Anemia.**—Smith reports a case of Mediterranean or Cooley's anemia in a youth of 19 who has been observed since he was 4. The case illustrates the form of the

disease in which adult life is reached. The familial potentiality of the disease is emphasized by the fact that every member of the family had some abnormality of the erythrocytes.

**Diet and Sulfanilamide Toxicity**—A high protein (casein) diet given to rats was observed by Kapnick and his co-workers to protect the animals against large amounts of sulfanilamide administered daily in acacia suspension. The survival, weight gain, condition of coat, physical activity and clinical appearance were better. Drug intolerance was increasingly apparent on the general high fat and high carbohydrate diet. On a high protein diet the volume of urine increased, more of the drug was eliminated and the concentration of the drug in the blood was lower. The greater tolerance afforded by the high protein diet was probably due to some extent to its more rapid excretion.

**Monocytic Leukemia**—Sterne stresses the fact that monocytic leukemia can be definitely diagnosed only by demonstrating the pathologic monocytes in the peripheral blood stained with Wright's solution. The stain will also differentiate this leukemia from the myeloid and lymphatic leukemias. In his 5 patients the young myeloid cells varied between 2 to 15 per cent. Ordinarily the percentage of monocytes, both mature and immature, is high enough (more than 60 per cent in twelve of seventeen determinations) to avoid confusion as to whether the monocyte or the myelocyte is the leukemic strain of cell. In

the five determinations showing a lower percentage more than half of the monocytes were young forms, and the myeloid elements never exceeded 10 per cent, leaving little doubt as to which was the leukemic strain. In those few cases in which immature myeloid and monocytic elements are present in equal numbers the leukemic series is the one which will show amitotic nuclear division, unequal divisions of nucleoli and incomplete mitotic spindles with resulting nuclei of unequal size. Certain cases of monocytic leukemia show a high percentage of clasmocytes. Dameshek believes this cell to be the forerunner of the monocyte. If a trained hematologist and pathologist are available additional valuable diagnostic evidence may be obtained from supravital staining, lymph node biopsy and bone marrow aspiration. Supravital staining differentiates monocytes and their precursors from other cell types, biopsy of the lymph nodes and bone marrow aspiration distinguish monocytic leukemia from other diseases producing reticuloendothelial hyperplasia. A simple classification of the relative age of monocytes that will suffice in most instances is similar to that used for the myeloid series: the youngest recognizable cell is called a monoblast (corresponding to the myeloblast), a slightly older form a promonocyte (promyelocyte), a still older cell a young monocyte (myelocyte) and finally the adult monocyte (mature neutrophil). The last three, and frequently the first type, may be satisfactorily identified by means of a Wright's stain of the peripheral blood.

- \*Diagnosis and Control of Brucellosis I F Huddleson, Lansing, Mich—p 106

**Tularemia**—Werling discusses 10 cases of tularemia (9 of the ulceroglandular and 1 of the typhoid type) observed between June 1937 and November 1940. All the patients recovered. The infection of 1 followed tick bite, 8 handled wild rabbits, and no definite source could be determined for 1. Six of the patients received 0.6 Gm of neoarsphenamine at weekly intervals with good results in 5 after an average of five doses, 2 received sulfanilamide without any apparent benefit and 2 received serum, which still seems to be the best method of treatment. For the greatest benefit, serum and neoarsphenamine must be administered early.

**Diagnosis and Control of Brucellosis**—During an epidemic of melitensis brucellosis Huddleson had an opportunity for making a comparative study of four diagnostic tests in 41 clinical and 49 subclinical cases of the disease: the blood cultures, the skin, the agglutination and the phagocytosis tests. Of the 4 clinical cases with blood serums negative to the agglutination test 3 showed a positive blood culture on the same date. The blood culture was positive in 12 other clinical cases which at the time showed a maximal agglutination titer of 1:25. The interval between the date of onset and the date the agglutination test was made and titer obtained varied from one to eighty days. There does not appear to be any relationship between the strength of the titer and the time the test was made after onset. The brucellergen skin test was positive in all clinical cases. The phagocytosis test was confusing in 8 of the 41 clinical cases in that the phagocytic picture was similar to that observed in immune individuals. On the basis of the results of each of the laboratory tests, too much reliance should not be placed on any one test to confirm the early diagnosis of clinical brucellosis. The results of all the available tests must be carefully analyzed before a positive diagnosis is arrived at. In considering the results on the group classified as subclinical cases it is shown conclusively that it is possible to demonstrate active infection long after exposure to infective material in individuals in whom clinical manifestations of brucellosis never developed. Since brucellosis is primarily an animal borne disease, its prevalence in man can be reduced only either by suppressing the disease in animals or by effectively breaking the infection chains between animals and man. The three effective measures in animal brucellosis are slaughter of infected animals.

segregation of infected animals from the noninfected on separate farms and immunization of calves under 8 months of age. Control of the disease in cattle by vaccinating the calf is worthy of trial. Another simple and inexpensive control measure in animals would be the requirement of a negative blood test on animals sold for breeding or for dairy purposes. The incidence of the disease in man could be reduced quickly if the owners of livestock used more caution in the handling of infected animals, their excreta and secretions and by the proper pasteurization of all milk from infected animals used for human consumption.

#### Acute and Chronic Perforations of Gallbladder—

Schaeffer does not believe that there are silent and harmless gallstones. When gallstones are discovered they should be removed, preferably by cholecystectomy. He operated on 601 patients with disease of the gallbladder from 1934 to 1941, among them 20 whose gallbladders were perforated. These 20 were found among the 122 acute cases. Eight of the 20 patients died, there were 6 with chronic perforations, 2 of whom died. Eighteen of the 20 patients were women, the youngest was 30 and the oldest was 77. The average age of those who died was 68 and of those who recovered 54.4 years. The patients complained of symptoms before admission to the hospital from two weeks to thirty-five years. When gallstones are revealed roentgenographically or there is a definite history of disease of the gallbladder the patient should not only be advised to have them removed surgically but should be urged and persuaded to be operated on before the condition of the gallbladder becomes acute and is followed by perforation and peritonitis. Only 3 of the 20 patients with perforations complained of symptoms for less than one year. All but 3 of the patients with acute perforations were operated on within twenty-four hours after admission to the hospital, those with a chronic condition within one to eighteen days. The acute perforation is an abdominal emergency requiring immediate operation. The author's attitude in acute cholecystitis is that the operation should be done in the acute stage rather than to wait until gangrene and perforation occur. Perforation produces an immediate severe chemical and toxic peritonitis. The operative procedure must be determined by the patient's clinical condition.

**Painless Myocardial Infarction**—Stroud and Wagner report 2 cases of painless myocardial infarction. They have observed a small group of persons who have been subjected to paravertebral injection of 1 per cent ammonium chloride for the relief of the pain of angina pectoris. Clark has shown that afferent impulses which are interpreted as pain and warmth are conducted at least in part, by C fibers. These fibers may be eliminated if the nerve is injected with 1 per cent ammonium chloride. Subsequent to the injection these patients apparently no longer suffered pain on effort. The sensation of substernal fullness, tightness or oppression together with dyspnea still continued to limit their activity, although to a less extent than prior to the injections. The effect did not persist for more than four days. Ultimately alcohol was used. It gave more permanent relief but was occasionally complicated by neuritis. These symptoms have been termed "the pain equivalent of angina pectoris." It seems possible that some patients may

have an abnormality of the C fibers in the sympathetic chain which prevents the usual stimulation by the changes brought about by acute myocardial anoxia, or possibly the fibers have been destroyed by a chronic process so that they no longer respond to even severe changes. In myocardial infarction without pain all the objective signs of infarction are present, i.e. a fall in blood pressure, fever, leukocytosis and electrocardiographic changes. The sudden onset of dyspnea, congestive heart failure or an unusual attack of syncope in a known hypertensive patient deserves the same careful study and treatment as if the patient had experienced substernal pain radiating to the neck, the arms and the wrists.

**Various Qualities of Roentgen Rays in Therapy**—Six sets of voltage-filter-distance factors for x-ray beams are presented by Quimby. They cover the range between 100 kilovolts of unfiltered to 200 kilovolts of highly filtered radiation. Depth dose data for these beams, 100, 100, 120, 140, 200 and 200 kilovolts with respectively no filter, 1 mm of aluminum, 3 mm of aluminum, 0.25 mm of copper, 0.5 mm of copper and 2 mm of copper, half value layer of 0.9 mm of aluminum, 1.9 mm of aluminum, 4.3 mm of aluminum, 8.6 mm of aluminum, 0.9 mm of copper and 1.8 mm of copper and a focal skin distance of 15, 20, 30, 40, 50 and 80 cm are presented in such a manner as to facilitate determinations as to their relative values in any specific condition. The approximate number of roentgens delivered per minute for the six sets of roentgen qualities are 400, 150, 40, 15, 45 and 8. The values are based on averages of calibrations made on low voltage machines operating at 4 to 5 milliamperes and on high voltage machines

operating at 20 to 25 milliamperes. In selecting the quality of radiation to be employed for any particular lesion the roentgenologist must take into account not only the dose at that definite depth but also the doses to overlying and underlying structures.

**Roentgen Rays for Inflammatory Conditions**—In describing the action of roentgen rays on inflammatory conditions, Desjardins points out that each variety of cell in the body has a specific sensitiveness to roentgen rays, the leukocytes are the most sensitive. Not only do roentgen rays have a decidedly deleterious action on the important varieties of leukocytes but the action is surprisingly rapid. When the effect of irradiation on an inflammatory lesion is closely observed, the rate and manner of the response of the cells is often so similar to that under experimental conditions that a relationship between the two is almost inescapable. When exposed to roentgen rays it is probable that a proportion of the leukocytes are destroyed, the cells disintegrate effectively and their contents, including the bacteriolytic substances which they contain, are destroyed and scattered between the remaining intact cells and tissue fluid of the inflamed area. As the disintegration proceeds it is accompanied or followed by an increase in phagocytosis. Some of the reticular cells most probably assume a phagocytic property. Chronic inflammations respond best to repeated doses somewhat larger than the single ones required for acute inflammations. The greater the degree of leukocytic infiltration (as in acute infection) the more definite and the more rapid is the effect of treatment. Leukocytic infiltration and connective tissue proliferation (as in chronic inflammation) act in opposite directions, the former increases the effect of irradiation and the latter diminishes this effect.

**Roentgen Therapy for Pneumonia**—Rousseau and his associates limit their discussion to the analysis of 104 cases of acute lobar pneumonia since 1937 with roentgen therapy and the usual supportive and symptomatic measures and of 29 in which irradiation was used only after sulfonamide therapy for not less than three or more than seven days and the usual routine medical care proved valueless, and death seemed inevitable. Of the 104 patients 98 recovered and 6 died. The average duration of illness before irradiation was instituted was two days. Of the 29 patients 22 recovered and 7 died. The average duration of these patients' illness before roentgen therapy was begun was five and eight-tenths days. The authors conclude that although the effectiveness and simplicity of sulfonamide therapy for pneumonia entitle it to first place, roentgen treatment appears in some cases to have distinct advantages, especially for persons who are known to tolerate the sulfonamides badly, the very old, the debilitated and those with serious cardiac, renal or hepatic disease, whose recovery may be curtailed by the toxic effects of the drug. No ill effects from irradiation could be detected in persons already saturated with the sulfonamide drugs. The interval between the roentgen treatment and death of all the patients who died was less than fifteen hours. All the patients who survived for as long as fifteen hours after roentgen treatment was begun recovered completely. This suggests that the treatment may not exert its maximal effect on the course of the disease for fifteen to twenty-four hours. Usually changes in the temperature, pulse, respiration and leukocyte count were not demonstrable until fifteen to thirty-six hours after roentgen treatment.

**Radium for Postoperative Parotitis**—Fricke and Madging believe that the reports in the literature on the serious potentialities of acute postoperative parotitis have been unduly pessimistic. When death does occur the primary disease for which the operation was performed is usually responsible and the parotitis is only a contributing factor. This was true of their 190 patients treated with radium and of 79 treated by other methods. Approximately 11 per cent of the patients treated with radium later died, as did 7 per cent of those not irradiated. Seven experienced spontaneous rupture and drainage, but all these recovered. In 8 per cent of those in whom radium was employed and in 19 per cent of those treated by other methods the extent of the infection increased, fluctuation appeared and surgical drainage became necessary. According to most investigators, when incision and drainage are required the prognosis is much more serious. A detailed study of the 19 patients who died revealed that parotitis was the chief cause

of death of only 1. The average age of the patients who died was ten years more than the average age of the entire group. The preceding operation in 9 of the 19 patients who died had been performed for a malignant tumor, usually of the colon. The principal cause of death was peritonitis, with bronchopneumonia second, followed by uremia and pulmonary embolism. The parotitis of 5 patients had either cleared up entirely or was subsiding at the time of death.

**Roentgen Treatment of Acute Peritonitis**—The opinion of Kelly and Dowell is that if gas gangrene and acute spreading peritonitis of intestinal origin are caused by the same organism their excellent results with roentgen therapy in the few cases that they so treated are explained. Regardless of the question of bacterial etiology, they are convinced that the results of irradiation in acute peritonitis will parallel those secured in gas gangrene and that the mortality rate following appendicitis will be decidedly reduced. Of all the cases of acute peritonitis treated in the various stages by different methods that are listed in the record room of St. Joseph's Creighton Memorial Hospital the best results were obtained with irradiation. Of 109 treated by general measures 71 died, of 42 treated with sulfanilamide and general measures 16 died, of 21 given sulfanilamide, irradiation and general measures 7 died and of 30 treated by roentgen radiation and general measures 6 died. Conditions which preclude success from the roentgen treatment of peritonitis are its delayed use, organic intestinal obstruction, open and leaking intestinal perforation, the early internal use of the sulfonamides simultaneously with roentgen therapy and underlying organic pathologic changes which are fatal in themselves.

**Acute Postoperative Parotitis**—A method for treating acute postoperative parotitis by irradiation is outlined by Pendergrass and Hodes. Treatment is instituted as soon as the diagnosis is made. Relief of obstruction of Stenson's duct should be attempted by aspirating, probing, gentle irrigation or/and strong suction, but free drainage from the parotid should be established. Only then is the parotid irradiated with roentgen rays generated at 130 kilovolts, filtered through 0.25 mm of copper and 1 mm of aluminum. The skin target distance is 25 to 30 cm and the port is large enough to extend beyond the inflamed area. If the patient is too sick to be brought to the x-ray department for treatment, the portable x-ray machine is used at his bedside. On the first and on the second day a dose of 150 roentgens is delivered to the skin overlying the infected gland, 100 roentgens the third day, none on the fourth day and occasionally 75 to 100 roentgens on the fifth day. From the time the patient is first seen, every effort is made to promote emptying of the parotid, his fluid balance is watched carefully, he chews gum constantly and sucks on hard sour candy, and hot mouth washes are employed every hour. Mincing the gland is an extremely important though somewhat hazardous procedure, as the pressure exerted must be gentle. The gland should always be "milked" in the direction of the normal flow of its secretions. Of 47 patients with acute postoperative parotitis given roentgen therapy, 19 responded within four days, the improvement of 13 was somewhat less dramatic and 15 obtained little or no effect from the treatment, in 7 incision and drainage of the gland were resorted to. Death from parotitis alone is rare, usually it should be attributed to the primary disease.

**Suprasellar Cyst of Rathke's Pouch**—Rowlands and his collaborators report a case of tumor of the hypophyseal duct in a man of 43 with a symptomatology comparable to or in large measure identical with that occurring in Simmonds' cachexia and in complete experimental hypophysectomy. Infantilism inhibited growth retardation of age changes in chondral cartilage arrest of sexual development diabetes insipidus, disturbance of carbohydrate and fat metabolism and of heat regulation a subnormal basal metabolism symptomatic narcolepsy and mental changes were present. At necropsy the pituitary stalk was found destroyed the posterior pituitary lobe almost completely destroyed two thirds of the anterior lobe was replaced by clefts of cholesterol crystals surrounded by collagen and numerous foreign body giant cells and the degeneration of the remnant of the anterior lobe was advanced. It is probable that the whole of the pituitary gland was functionless and if this was so it would explain the greater part of the symptomatology. Study of the skull disclosed a large epidermoid cyst in the region of the septum pellucidum and left frontal lobe.

**Night Visual Capacity and Flying**—Livingston does not believe that vision in the night sky corresponds to the state of dark adaptation used in laboratory studies and therefore suggests that the term night visual capacity and not dark adaptation be used. The range at which aircraft become detectable is influenced by the position of the observer in relation to the highest background brightness. The use of oxygen for night flying is of greatest importance withholding it impairs night vision at relatively low altitudes. The two methods for preparing the eyes of pilots before taking off are retention in a dark room or the wearing of dark goggles of low light transmission. The goggles overcome the risk of the transfer of upper respiratory ailments and the disinclination of active men to be inactive for a period before flying. From a study of recent work it became clear that the real problem was to suit the ophthalmic technique to the visual reactions under flying conditions. The requirements of the Royal Air Force were met by creating an apparatus which required a preliminary introductory preparation that caused no abnormal sensations. The instrument is a rotating hexagon of six metal sides 24 inches high with four rectangular apertures in each face. Behind each panel is a white flashed opal screen visible only in the apertures. The screens can be moved up or down so that the objects etched in black on them can be readily altered. The distance of each of the subjects 6 of whom are examined at a time from his pupil is 1 yard. The objects regarded separately by direct fixation are indecipherable but when the eyes move from one object to another the angle covered reaches well into the rod area of the retina and scotopic vision is stimulated and it is possible to record what is seen. This principle has been created

to encourage observers to employ eccentric fixation in identifying aircraft at night. To be certain that the subjects to be examined are in a comparable state of adaptation they wear dark goggles of equal transmission for half an hour before entering the test room from which all light can be excluded. Each subject is handed a card illustrating some of the characters which he will be expected to analyze, the light transmission of the goggles is sufficient for their scrutiny. Each subject is handed a board on which is clamped a braille type card. The light in the dark room is extinguished the goggles are removed and during the fifteen minutes in complete darkness it is carefully explained that there are four similar tests, each corresponding to a metal button on the board, which is placed in such a way that each button corresponds to a transverse grooved line on the braille card. The buttons run down the middle of the board, making a left and a right braille line. Each test exposes first objects and then letters. The subject writes the name or draws the object recognized on the left side, and the letters seen are written on the right side. The letters may be set in abnormal positions and should be copied as set. Each test lasts one minute, and test succeeds test without pause. The illumination on each occasion is slightly increased until the third test is reached, when one minute of glare from an electric lamp is introduced. The subject looks slightly beneath the lamp. When scoring, a differentiation is made between a night pilot of bomber aircraft and an air observer or air gunner. A high degree of night vision is less important in the case of the pilot because he is flying on lighted instruments.

- Experience with the Wilson and Blair Medium for Bacillus Dysentery (Flexner) D B Bradshaw —p 181
- Carotid Cavernous Aneurysm with Fistula W J Roche —p 182

**Mental Symptoms of Cerebrospinal Meningitis**—Weir and Vautier found that 3 men with abnormal mental symptoms who were certified had cerebrospinal meningitis associated with wartime effort and overcrowding. Each presented a picture of confusional psychosis confusion, disorientation irritability restlessness and general resistiveness with violent outbursts. Each had a history of alcoholism. The alcoholism might have lowered the resistance to the meningococcus which was most likely harboring in the nasopharynx of carriers in the vicinity. Meningitis was suspected on finding some degree of nuchal rigidity and commencing retraction of the head. Mild headache appeared only as the patient's mental state improved. A lumbar puncture should be done to determine the nature of the illness. No other case has occurred previously or has arisen since in the area from which each of the 3 patients came. Medical officers in charge of the health of the workers in large industrial concerns and war industries have a special responsibility, for it is among such people that the disease is apt to occur without any warning. Cerebrospinal meningitis should be considered when mental symptoms suddenly develop in any person. All persons with acute confusional psychosis should at first be sent to mental hospitals as temporary patients.

- Isolated Fracture of Carpal Cuneiform W P Greening —p 221

**Treatment of Fresh Compound Fractures and Wounds**—Scott points out that those who first see fresh compound fractures and wounds are not sufficiently aware of the urgency of adequate treatment within six hours. The only justifiable cause for delay is the patient's general condition. Early splintage if a compound fracture is not contaminated is essential.

otherwise it should not be reduced until the wound is excised. When sedation and splintage are in order, a plasma drip should be started before the operation. Any patient requiring more than 2 pints of fluid should be given blood instead of plasma after the second pint. During incision and excision of all necrotic tissue of a wound a tourniquet should never be maintained in place. Failure to excise a wound because it is more than six hours old is to deny the principle of excision. After approximately forty-eight hours the Winnett Orr principle of incision and drainage is usually sufficient for if gas gangrene has not developed in that time it is not likely to do so. The wound should be sutured if seen within six hours and, if approximation without cutaneous tension is not possible, sutures should not be used. Conditions in which it is safe to do a primary suture seldom arise in war surgery. If the wound is not sutured and infection is not present the wound should be packed with dry gauze and plaster applied over the gauze. If infection is present petrolatum gauze to provide the required drainage is used. The limb should be immobilized one joint above and one joint below the wound or fracture. If padding is used under the plaster it must be highly absorbent. When a wound is left open, no window should be cut. In an uninfected wound is sutured there is no need to cut a window. The cutting of a window in the plaster of such a wound suggests doubt as to the surgeon's wisdom in suturing it. Tetanus toxoid may sometimes make antitetanus serum unnecessary, but at present it should always be employed. To start the patient on a course of sulfonamide therapy after his fresh wound has been treated is an admission of failure. When such a patient's temperature rises above 100 F and infection is present surgery has been faulty, the infecting organism should be determined and the appropriate sulfonamide derivative prescribed. A point cited against the use of the excision-incision closed plaster technic is that gas gangrene starts in the calf, the thigh and the shoulder. If the surgeon is in doubt as to the efficiency of the excision and incision of such a wound, plaster should not be applied for forty-eight to seventy-two hours. If infection does not develop in this time, plaster may be applied. In the earliest stage of gas gangrene usually a clear change in the general condition of the patient occurs, and if this change is noted and acted on directly the diagnosis will be made just as soon as it would have been by repeated inspection of the wound. Serum is of prophylactic value in the treatment of gas gangrene only if adequate doses (100,000 units in twenty-four hours) are given. Of 31 patients with compound fractures and wounds involving joints treated by the author, only 1 died. This patient had a compound fracture of both tibias and died of head injuries within twenty-four hours. A sulfonamide drug was administered to only 3 patients. The average stay in the hospital for all the patients was seventeen days. All were put in plaster.

**Gastric Lavage in Diagnosis of Tuberculosis**—Davies and Doherty examined the gastric contents of 75 boys and girls 2 to 11 years of age for tubercle bacilli. Sixty-four of the children had pulmonary and 11 had nonpulmonary tuberculosis. Faucial, nasopharyngeal and middle ear tuberculosis were excluded. Tubercle bacilli of the human type were found in the gastric contents of 24 patients. A positive result was not obtained in any of the nonpulmonary cases. Tubercle bacilli were found in 3 specimens on direct examination after concentration. Ten specimens were positive on culture and guinea pig inoculation, 7 on culture only and in 7 after guinea pig inoculation only. A positive result on direct examination should not be accepted unless confirmed by culture or by guinea pig inoculation. The three positive results on direct examination were also positive on culture or guinea pig inoculation. A parenchymal lesion was present in 22 of the positive cases, and pleural effusions in the remaining 2. In 14 the lesion was in the right pulmonary field and in 4 in the left lung, in 4 others there were bilateral lesions. The gastric contents of all patients with parenchymal lesions should be examined on successive days and frequently during treatment. A child with tubercle bacilli in its stomach contents should be considered infectious until repeated negative results have been obtained. The clinical course of the disease in such children is favorable, the lesion gradually resolves, leaving evidence of calcification or fibrosis.

 Barbiturate Poisoning Treated with Picrotoxin M. Fishman—p. 199

**Use of Plasma in a Hospital Ship**—Their experience with the administration of plasma to 16 severely burned patients in a hospital ship prompts Wolfe and Clegg to suggest that its use be more widespread at sea. The treatment of shock in such casualties during transport to base hospitals can save many lives. The authors prefer dilute citrated plasma as it can be easily prepared and supplied in one container ready for use after simple filtration. Experience may prove that it can be stored at room temperature, meanwhile refrigeration, especially in tropical and subtropical climates, is desirable. Such facilities are available on ships. Freezing solid, if possible, is recommended. The burns of the 16 patients were second degree and extensive or complicated by associated injuries. All but one were treated by the tannic acid silver nitrate technic (Bettman 1935). The burns of only 2 patients failed to heal within a fortnight. There were 7 deaths, 4 were of severely burned patients who showed no response and died within fourteen hours of admission, 1 responded well to plasma but died twenty-nine hours after admission, 1 responded well to plasma but symptoms of burn toxemia developed on the fourth postoperative day and he died two days later of capillary bronchitis, and 1 acquired streptococcal tonsillitis and pharyngitis and he died eight days after admission of massive obstructive atelectasis due to capillary bronchitis. The degree of hemoconcentration after plasma has been given must be estimated repeatedly. Plasma transfusion in burns is usually necessary for thirty-six to forty-eight hours, because during this period plasma is still being lost into the burned area. In burns if plasma infusion was delayed or treatment of the burn postponed local edema progressed, whereas after plasma was given most of the edema disappeared within twelve hours. When the burned surface is sealed by coagulation, plasma infusion will restore to the circulation the fluid lost in the tissue spaces, provided capillary damage is not irreparable. The cutaneous loss can be balanced by the oral administration of fluid supplemented if necessary by rectal and intravenous saline solution. Saline baths are of value when the patient's life is not threatened, but they have no place in the treatment of extensive superficial burns.

**Intraperitoneal Sulfapyridine in Acute Abdominal Conditions**—Gardiner used sulfapyridine intraperitoneally in 15 cases of perforated appendix, in 2 of perforation of the sigmoid colon and in 2 of resection of a gangrenous small intestine. All but 1 patient recovered and none had the usual prolonged outpouring of thick pus from the abdominal cavity and wound. Thus hospitalization was shortened. One patient died of peritonitis. In further similar trials of the drug the bacteriology of the abdominal fluid should be determined and the level of the sulfonamide derivative in the blood should be recorded.

**Persistent Myalgia Following Sore Throat**—An epidemic of 7 cases of myalgia is reported by Houghton and Jones and its clinical features are discussed. The 7 patients were members of the nursing staff in whom sore throat developed in 6 it was followed in eight to twenty-one days by paroxysmal muscle and severe headache. Subungual hemorrhages and the toes were observed in 2. Pyrexia and pains persisted up to five months, menstrual disturbances and spontaneous epistaxis were also present. All laboratory studies including cutaneous tests and precipitin reactions for trichinosis were negative. Biopsy of a painful indurated area in a muscle showed no abnormal changes, and no treatment was of any value. The patients recovered without any sequelae. It is suggested that the condition was due to an unidentified microorganism or virus.

\*Edema and Cachexia from Ascariasis N Villegas—p 483

**Edema and Cachexia from Ascariasis**—Villegas describes a type of cachexia in nonsyphilitic children with ascariasis which is characterized by excessive coldness of the extremities, bleeding gums, pellagroid mucosal and buccal lesions dermatitis, anorexia, vomiting, diarrhea or constipation, micturism, loss of appetite, hypotension muscular and psychic asthenia somnolence and rapid progressive decline in the weight and in the general condition of the patient. It is observed in poorly nourished children of tropical and semitropical countries. Treatment with diuretics, anthelmintics epinephrine, vitamins, tonics and hormone preparations usually fails. Mortality is 80 per cent. Good results were obtained from administration of 8 drops daily of nuxvomica for ten to fifteen days. The general condition improved from the first two or three days of the treatment, during which the patients eliminated a large number of ascarids and regained their appetite. After three to five days of the treatment, 13 Gm of castor oil with 4 drops of volatile oil of chenopodium is given. The diet consists of milk, fruits, meat, vegetables and carbohydrates given as soon as the treatment starts. Permanent cure was obtained in all cases. Edema of the feet disappeared in the course of the treatment.

\*Vulvovaginitis in Young Girls J Alves de Medeiros—p 314  
Cancer of the Thyroid L Galvão—p 333

**Vulvovaginitis in Young Girls**—De Medeiros reports 23 cases of vulvovaginitis in girls between the ages of 6 and 10 years. Treatment consisted in a daily sitz bath with a 1:8,000 potassium permanganate solution and tonics. Patients with oxyuriasis but without gonococcal infection were also given specific vermifuges. A cure resulted in three to four months. Patients with gonococcal infection were given protein therapy and antigonococcus vaccines. The treatment was supplemented by administration of sulfanilamide. Estrogen was administered to patients who exhibited disorders of the genitalia. Cure was verified in all cases by a follow-up of the patients for several months.

## Revista de la Sociedad de Pediatría de Rosario

\*Biermer's Pernicious Anemia in Infant A R Dutruel and S L Rabasa—p 197

\*Bronchoaspiration in Asphyxia of Newborn Infants M Gonzalez Loza and J C Santa Maria—p 228

**Pernicious Anemia in Infant**—Dutruel and Rabasa review the literature and report a case of pernicious anemia in an infant 10 months old. The appearance of the patient and the alterations of the peripheral blood and of the sternal bone marrow were typical of Biermer's anemia. There were hypochlorhydria and diminished reflexes in the legs. Liver therapy resulted in clinical improvement, which was maintained by feeding raw liver in the diet. Discontinuance of the latter was followed by a recurrence. The disease should be called megaloblastic rather than pernicious anemia. A diagnosis of pernicious anemia in an infant is permissible only when the changes in the blood and in the sternal bone marrow are typical. A favorable response to liver therapy confirms the diagnosis.

**Bronchoaspiration in Asphyxia of Newborn Infants**—Asphyxia produced by aspiration of amniotic fluid and mucus from the mother's genitalia is frequent in normal children, and even more so in the premature and weak newborn infants. It may recur several times during the first two days of life and may be the cause of pulmonary edema or bronchopneumonia at a later date. Gonzalez Loza and Santa Maria report successful results from bronchoaspiration by means of a cannula carefully introduced through the glottis into the bronchi under laryngoscopic control. After aspiration oxygen is insufflated under pressure through the cannula. A mixture of oxygen and

carbon dioxide is insufflated when stimulation of respiration is indicated. The procedure can be repeated, if necessary, after twelve or twenty-four hours. For two or three days after performance of laryngoscopic bronchoaspiration the secretions may be removed from the mouth and pharynx by simple aspiration. The authors advise having the necessary equipment for laryngoscopic bronchoaspiration in maternity hospitals.

\*Articular Changes in Late Congenital Syphilis H O Loos—p 549

\*Familial Acrogeria H Gottron—p 571

**Aspiration Biopsy of Liver**—Roholm and Krarup state that arsphenamine jaundice developing in syphilitic patients is not a syphilitic lesion since it is also observed after arsphenamine treatment in the absence of syphilis. Attention has been called to the similarity between arsphenamine jaundice and epidemic hepatitis. It is believed that arsphenamine damages the liver and prepares the way for the unknown virus of epidemic hepatitis. The microscopic changes in the liver are identical in epidemic hepatitis and in the arsphenamine jaundice. The authors report pathologic studies on patients with acute diffuse hepatitis subjected to aspiration biopsy according to the method of Iversen and Roholm. Some of these had been treated with arsphenamine and the liver changes observed in them did not differ from the typical picture of acute epidemic hepatitis. The authors present histories of 10 patients with arsphenamine jaundice on whom eleven aspiration biopsies were done. The microscopic changes in the liver were identical in the so-called arsphenamine icterus and in the acute epidemic hepatitis. The two disorders are identical. Arsphenamine reduces the resistance of the liver to the unknown virus of acute epidemic hepatitis.

**Articular Changes in Late Congenital Syphilis**—Loos states that articular changes of late congenital syphilis, which were quite frequent before 1900, have decreased noticeably in recent decades. The manifestation is evident about the fifth year of life and is most frequent during the tenth year. The thirtieth year can be taken as the upper age limit of manifestation. The knee is the most frequent localization. From the clinical point of view the author differentiates between articular changes without and with involvement of bones and cartilages. Those without osseocartilaginous involvement include (1) serous synovitis (simple hydrarthrosis), in which usually the knee joint shows a profuse but not very painful hydrops, and roentgenologic changes are absent, (2) hyperplastic synovitis, in which the articular capsule exhibits inflammatory hyperplastic changes that appear in the roentgenogram as thickening. The articular changes with involvement of bones and cartilages include (1) hydrops with epiphysitis and (2) pseudotumor albus syphiliticus. Hydrops with epiphysitis is the most frequent form of congenital late articular syphilis. Four of the author's six observations belonged to this group. Aside from the customary clinical picture of hydrops with thickening of the wall and epiphyseal swelling of the bone there may be severe deformities with bony ankylosis. The pathologic anatomic basis of this process consists in gummatous inflammations of the bone ends of the articular cartilage and of the soft parts. Pseudotumor albus syphiliticus, the rarest form of late congenital arthrosyphilis was designated thus because of its similarity to the tuberculous fungus. The rarity of ulcerous destruction of the skin above the diseased joint prevents its being mistaken for tuberculosis. In addition to bone changes such as multiple gummas and osteomyelitis gummosa tibiae, ocular lesions are frequently associated with the articular lesions of late congenital syphilis. Parenchymatous keratitis and disseminated choroiditis are particularly frequent. The combined administration of neoarsphenamine and bismuth compounds and

the oral administration of iodine together with local electro-physical measures produced favorable results in late congenital arthrosyphilis

**Familial Acrogeria**—Gotttron applies the term acrogeria to a disorder which he observed in siblings, a girl aged 19 and a youth aged 16. Both had unusually small hands and feet and severe atrophy of the skin on these parts. The author thinks that this disorder is a localized and abortive form of progeria. The familial occurrence of this rare condition suggests a genotypic origin. From this point of view, acrogeria can be considered one of the as yet little known hereditary disorders of the connective and fat tissues.

\*Rheumatoid Sepsis H. Oettel —p 773  
Diagnosis of Auriculoventricular Rhythm and Block O. Reimer —p 783

**Hepatic Puncture**—Kofler directs attention to the recent method of Iversen and Roholm (*Acta med Scandinav* 102:1 [Sept 23] 1939, abstr. THE JOURNAL, Dec 9, 1939, p 2194). At his clinic in Vienna this technic has been used in about one hundred punctures on patients ranging in age between 16 and 77 years. Stasis liver, fatty liver, various forms of icterus, cirrhosis and carcinoma were some of the conditions in which hepatic puncture was done. In some of the cases the puncture was repeated at weekly or monthly intervals. The technic of the intravital aspiration biopsy is described in detail and the possible dangers are discussed. Complications may be of four different types: hemorrhage, infection, injury to other organs and penetration of air into the hepatic tissue. The last named complication is obviated by the fact that no aspirators are used. Injuries of other organs can generally be avoided. When they do occur they usually heal without surgical intervention and without complications. The danger of the development of a hepatic abscess as the result of defective sterility or of a peritonitis or pleuritis from the puncture of an existing abscess is slight. The chief danger and practically the only one is that of hemorrhage. It can be avoided by careful preliminary examination and preparation of the patient. Aspiration biopsy should never be done in the presence of a hemorrhagic diathesis. Hepatic puncture has demonstrated that a hepatitis in Eppinger's meaning of that term is the basis of catarrhal icterus.

**Prophylaxis of Epidemic Influenza by Inhalation of Antiserum**—Smorodinzew and his collaborators emphasize that the prophylactic use of specific influenza serum will be successful only if the disorder in question is actually epidemic influenza and not some other disease. English as well as Russian investigators have demonstrated the different etiology of disorders all of which were designated as influenza. The virus of epidemic influenza is rarely encountered in sporadic cases of influenza, and there are various serologic types of influenza virus. The anti-influenza serum, which effectively neutralizes the typical strain used for its production, may have little effect on other strains. For this reason it is essential to produce serums with a large "spectrum" of antibodies. The authors resorted to the prophylactic inhalation of antiserum for the first time in the influenza epidemic of February and March 1939. The finely dispersed serum was inhaled for five minutes through a respirator, the tube of which was connected with a chamber containing a spray that was activated by an electric ventilator. From 2 to 3 Gm of serum was inhaled in the course of five minutes. The inhalator apparatus used by the authors had fifteen outlets or respirator attachments, so that 15 persons could be treated simultaneously. The inhalation, whether done once or repeated after an interval of from ten to fifteen days, causes neither local nor general reactions and is therefore applicable in large groups. It produces a noticeable reduction in influenza mor-

bidity. Of 501 employees of a large department store who were subjected to prophylactic serum inhalation at the onset of an epidemic of influenza and again after from ten to fifteen days, only 4 developed a mild form of influenza (0.8 per cent), whereas of an untreated control group of 1,825 employees 150 (8.2 per cent) developed influenza. The authors conclude that inhalation of anti-influenza serum is not only of therapeutic but also of prophylactic value.

**Rheumatoid Sepsis**—According to Oettel, rheumatism may be only a link in a long chain of reactions in infectious processes. All transitional forms have been observed from sepsis by way of pyemia to sepsis lenta and to rheumatoid. The author reports 8 cases of rheumatoid sepsis. There appeared to be transitions between septic and rheumatoid tissue reactions. The simultaneous existence of hyperergic and septic reactions becomes manifest in the clinical syndrome "rheumatoid sepsis" and can be distinguished from septic processes in the restricted meaning of that term. Septic processes of the skin and paronychia are symptoms of rheumatoid sepsis, rheumatism develops only when the septic component predominates. The first mentioned symptoms may be the signal of septic rheumatism, but rheumatism may also exist in their absence. In addition to splenic tumor and parenchymal degeneration, a threatening circulatory weakness may develop. Bacteriologic examination often demonstrates pleomorphic streptococci. The septic focus of rheumatoid sepsis seems to be chiefly in the periphery. Septic rheumatism may run its course without endocarditis, in the severe form it may be fatal. Favorable therapeutic effects were produced with sulfonamide preparations and with the transfusion of febrile blood (from donors treated with colon bacillus vaccine).

\*Electric Shock Therapy by Cerletti Method Preliminary Report O. L. Forel —p 267  
\*Electric Shock Therapy in "Maison de Sante de Malevoz," Monthey, Valais, Switzerland A. Repond —p 270

**Electric Shock Therapy by Cerletti's Method**—Electric shock therapy has been used at Forel's clinic since the beginning of 1940, and its results were found to be superior to other methods of shock therapy. The application is rapid and simple, there has not been a single fatality, there is a complete and permanent amnesia regarding the shock. It is possible to repeat the shock on the same or the next day, although repetition after two days is preferred. The patient generally does not object to repetition of the treatment. It is useless to continue the method if the result is negative after from five to fifteen shocks. The indications for electric shock therapy are the same as for other forms of shock therapy. Psychotherapy is an indispensable accompaniment of the electric shock therapy. Patients should not be told about the epileptic convulsions. The patient knows that it will induce sleep and that he will wake up without recollecting what has happened. The apparatus should be kept out of sight. The patient's awakening, which is frequently accompanied by "primordial anxiety," deserves particular attention, because in the hours following it he is particularly amenable to psychotherapy. The changes in behavior and emotions give the impression of a catharsis; there is a relative release which makes possible an approach to the subconscious.

**Electric Shock Therapy**—Repond describes observations in 38 cases in which electric shock therapy was employed. Results are particularly favorable in melancholia and in schizophrenia, especially in cases in which stupor is present. Cure was obtained in 18 cases and great improvement in 11, the remaining 9 the treatment was ineffective. It is still unknown why patients with the same symptomatology fail to react, while others react quite readily to this therapy. Constitutional factors might be responsible.

## Book Notices

**Acute Alcoholic Intoxication. A Critical Review.** By Henry W. Newman M.D. Cloth Price \$2.50 1p 207 with 7 illustrations. Stanford University Press London Oxford University Press 1941

This is a timely review of the problem of acute alcoholic intoxication. The volume is divided into two parts. The first part describes the general actions of ethyl alcohol with a careful consideration of the absorption, distribution, excretion and combustion. The author believes that the distribution of alcohol in the body is sufficiently constant to permit a fairly accurate prediction of the blood alcohol concentration after any given dosage of alcohol. Since the rate of fall of this concentration is fairly constant, the blood concentration at any time after ingestion may be predicted with accuracy. As regards the excretion of alcohol approximately 10 per cent of ingested alcohol can be accounted for in the breath and the urine. The remaining 90 per cent or more is metabolized in the body. The metabolism of alcohol is of interest. The first changes in the combustion of alcohol take place in the liver, leading to the production of acetic acid. Then, probably rapidly the intermediate products are burned to carbon dioxide and water or converted to other substances which can be burned or stored in the body. When dextrose is not being burned the rate of alcohol metabolism is decreased. Acceleration of alcohol metabolism occurs after the administration of protein or amino acids, after the administration of relatively large amounts of insulin or after increase of the body temperature with general increase in body metabolism. The second part of the volume is concerned with the toxicology of ethyl alcohol. This has chapters on acute toxicity, the chemical diagnoses of drunkenness and the treatment of acute alcoholic intoxication. The author believes that blood is the most satisfactory material for alcohol analysis. Breath analysis has the advantage of being simpler but is considered less reliable. There is an excellent discussion of the legal definition of intoxication prevailing in some states. The author reviews the various methods of treatment of acute alcoholic intoxication and accurately indicates that there are few therapeutic procedures of proved clinical value. When alcoholic intoxication is so severe as to cause respiratory failure, 10 per cent carbon dioxide inhalation, without rebreathing is indicated. There is limited use for subconvulsive doses of metrazol to stimulate respiration. Also intravenous dextrose, with or without small doses of insulin appears to be helpful. There is no consideration of the psychobiologic factors underlying alcoholism. The volume is clearly written and recommended as a careful review of the problem of acute alcoholic intoxication.

**Fondo de ojo a la luz de sodio (luz amarilla).** Por Justo Lijo Pavía. Paper Price 18 pesos Pp 199 with 101 illustrations. Buenos Aires. Editor El Ateneo 1941

The lamp employed is an Osram lamp, in which the volatilization of sodium ions on the walls of the tube produces an intense yellow light. Kleeefeld employed it for the purpose of better visualizing the fundus of eyes with cloudy media and of observing lesions deep in the retina, the nearly monochromatic light achieving better penetration of the tissues than ordinary light. The author reports his findings with this light in various conditions in comparison with those by ordinary and red free light. The conditions covered in the report are retinal detachment, persistent medullated nerve fibers, macular degeneration, various stages of macular lesion, macular hole, hypertensive retinopathy, trauma to the retina and optic atrophy. The observations in these conditions are visualized by the illustrations, chiefly reproductions of fundus photographs. Many are examples of the author's 'panoramic fundus representation, in which a number of photographs are joined together so as to show a large area of the fundus. In retinal detachment the sodium light allows observation of fine changes in the course of the nerve fibers, of traction folds and of changes in the paramacular reflex. In persistent medullated nerve fibers the outline of the disk can be seen best by this light. In macular degeneration very delicate defects in the internal retinal layers visible can be clearly outlined. In edema of the macula (early lesions) swelling of the

nerve fibers may be seen and fine changes in the caliber of the vessels. The choroidal vessels are seen more clearly than with other methods. Very early cystic changes are also visible. In hypertensive retinopathy the connection between hemorrhages in the smallest arterioles can be traced and objects in the small veins giving rise to hemorrhages can be seen. In a number of conditions the findings in the inner retinal layers were similar to those of red free light, while in deeper lesions red free light was inferior to sodium light. Of the forty-three references listed, fourteen are to previous articles by the author whose special interest has been fundus photography and the refined study of fundus lesions.

**Accepted Dental Remedies Containing a List of Official Drugs Selected to Promote a Rational Dental Materia Medica and Descriptions of Acceptable Nonofficial Articles.** Council on Dental Therapeutics. Seventh edition. Cloth Price \$1 Pp 309 Chicago American Dental Association 1941

No one who has watched the successive editions of this valuable and compendious volume can refrain from remarking on the success with which the Council on Dental Therapeutics has implemented the last words of its motto 'for Dentistry'. The present volume contains in admirably accessible form a concise and up to date statement of the materia medica and therapeutics needed by the practicing dentist. For example, while the chapter on vitamins offers a brief and well informed discussion on all the known vitamins with emphasis on their utilization by means of a well chosen diet the only preparations accepted and described are those containing A and/or D, which are most useful from the dental point of view. The necessity of cooperation between physician and dentist in this field is emphasized.

Of special dental interest are such chapters as those on adherent powders for dentures, denture cleaners and dentifrices, all concise, enlightened and effectively informative. The sanity and clarity of the dentifrice chapter is particularly commendable. In less than three short pages it gives a comprehensive and obviously well documented statement of the usefulness and limitations of dentifrices, clearing up many of the misconceptions that have resulted from dangerous and misleading commercial propaganda. Among the seventy or more accepted preparations the most widely advertised ones are conspicuous by their absence. The names of some of them may be found in the "Bibliographical Index to Proprietary and Unofficial Articles Not Included in A D R," which appears in the back of the book and refers mainly to unfavorable reports published in the *Journal of the American Dental Association*.

In the appendix material there also appear a valuable outline on symptoms and treatment of acute poisoning, a concise therapeutic index in connection with an excellent classification of drugs for specific dental use, and several pages of formulas and prescribing suggestions, which should be of great usefulness to the practicing dentist. The terminal index is adequate and not profuse.

Although *Accepted Dental Remedies* is intended primarily for the dentist, it has much information that is of value for the physician and the pharmacist.

**Criminal Youth and the Borstal System.** By William Healy M.D. and Benedict S. Alper. Cloth Price \$1.50 Pp 251 New York Commonwealth Fund London Oxford University Press 1941

This small volume is a valuable addition to the series of studies which Dr. William Healy and his collaborators have contributed to American criminology. The authors once more call attention to the unsatisfactory present management of penal institutions in this country. (Statistical studies report 80 per cent recidivism in certain institutions.) The authors' concise and vivid review of the English Borstal system is both instructive and enjoyable reading.

"Borstal village stands on a hill above Rochester, looking on the River Medway, and gives its name to the prison for boys and to the system of training which is in use there. The Borstal system is perhaps the most consistent attempt at substituting for punishment reform in the case of the youthful criminal who is still approachable and changeable. No one even if convicted of an offense can be committed for Borstal training until the prison commissioners have approved his suitability for such training. Originally youths between 16 and 21 were

eligible, later the age limit was extended to 23. Borstal training consists of a four year period consisting of two indeterminate stages from six to thirty-six months in an institution and the unexpired remainder of the four year term on parole to the Borstal Association.

The humanitarianism of the Borstal system is not the expression of any sentimentality but is fully consistent with its aim to create a human and occupational environment for the youthful criminal during his imprisonment which may have both a reforming influence on his personality and also prepare him for a trade. The main emphasis is on a careful selection of a suitable personnel. Experience, some training, a broad point of view, maturity and ability to get along with people are prerequisites. Members of the Borstal system receive civil service status, which gives them economic security.

"That the leaders have been able to draw such a fine body of people to work with them in many capacities is one of the most remarkable things about the Borstal system. Its success has been entirely dependent upon this." The core of the whole system is the utilization of personal influence. The authors, after carefully evaluating the existing evidence, come to the conclusion that "unquestionably the results of the Borstal system are relatively much better than those obtained by the reformatories of this country."

Healy and Alper also pay attention to certain weaknesses of the Borstal system. They think that it does not take full advantage of the great possibilities offered by this system for the scientific study of the personality and social factors of criminal careers by experts—psychiatrists and trained social workers. Only such studies would warrant a real progress in the field of the treatment of the criminal. The reader is left with the impression that the Borstal system without such methodical studies may remain an isolated experiment in the field of criminology and not have the great revolutionary effect which it could have if its principles could be scientifically tested and improved. The aim of the authors is to make the American public acquainted with it and hope that its best features could be used under the model youth corrective authority act of the American Law Institute. In this country there are all the preconditions for further developing this system with the help of the great number of well trained social workers and psychiatrists who for many years have been interested in the study of criminal careers.

**Diagnostic anatomo topographique de l'obstruction artérielle coronaire. Sixième partie. La thrombose artérielle souspéricardique gauche cause de l'ischémie aiguë du myocarde.** Par le Docteur Guillaume A. Bosco professeur titulaire de sémiologie et de propédeutique clinique à la Faculté des sciences médicales de Buenos Aires. Paper. Pp 276, with 31 illustrations. Buenos Aires 1941.

Myocardial ischemia is the sequel of a coronary arterial thrombotic process which appears in the left ventricle because this ventricle, in contrast with the right, offers favorable conditions for its appearance. This predisposition is explained by the pathogenic factors of the thrombosis: arterial or anatomic-pathologic, hemodynamic or circulatory, mechanical or myocardial. These factors combine to provoke the arterial obstruction in a determined site, prepared in advance by the circulatory status of the heart—the subpericardial zone. That this ischemia has been erroneously considered as right ventricular has been due to lack of knowledge of the anomalous coronary arterial distribution, that is to say the termination of the left circumflex artery in the posterior wall of the right ventricle, and, on the other hand, the lack of basic conceptions, such as those which the author describes. Thus is explained why the lesion produced by left coronary arterial obstruction has been generally accepted as right ventricular infarction. The illustrations are beautifully reproduced and fortify the author's thesis. His investigation led him to adopt the following nomenclature:

1 Anterior coronary syndrome, produced by thrombosis of the anterior descending branch, and its sequel, anterior apico-septal infarction.

2 Lateral coronary syndrome, produced by thrombosis of the left circumflex when of normal distribution, and its sequel, left parietolateral infarction.

3 Posterior coronary syndrome, produced by thrombosis of the left circumflex when of anomalous distribution, and its sequel, posterior parietoseptal infarction.

**A Manual of Pharmacology and its Applications to Therapeutics and Toxicology.** By Torald Sollmann, M.D., Professor of Pharmacology and Materia Medica in the School of Medicine of Western Reserve University, Cleveland. Sixth edition. Cloth. Price, \$8.75. Pp 1298. Philadelphia & London W B Saunders Company, 1942.

As the author states in the preface, the developments have become so extensive that almost every paragraph had to be rewritten. Changes are evident from the table of contents, which has been radically rearranged, to the individual chapters, the bibliography and the index. Probably of most current interest are the changes in the sections on the sulfonamides, vitamins, hormones, anesthetics and hypnotics and synthetic autonomic agents. To imply that the changes are confined largely to these sections would create an entirely erroneous impression, since revisions are evident throughout the book. Although the volume has increased in size by only one hundred and eight pages, the present edition records an abundance of valuable information not available in the fifth edition. This increase of material, added without greatly affecting the size of the book, is made possible by the omission or condensation of matter that has become of minor importance. Also the author has abandoned the policy of listing and describing all preparations of the United States Pharmacopeia and of the British Pharmacopeia, and has restricted bibliographic references to the last twenty years (a bibliography to 1920 inclusive is listed in the fifth edition). A further change in Sollmann's book is the preference given to English titles. The sixth edition of Sollmann's Manual of Pharmacology will remain one of the most useful and valued reference works on pharmacology.

**Internal Medicine in Old Age.** By Albert Mueller Deham, M.D., Associate Visiting Physician, Welfare Hospital for Chronic Diseases (Second Division), Department of Hospitals, New York City, and S. Milton Rabson, M.D., Assistant Professor of Pathology, New York Post Graduate Medical School, Columbia University, New York (on leave). Cloth. Price \$5. Pp 396. Baltimore: William Wood & Company, 1940.

Here is a truly clinical volume based on an extensive experience, on clinical reports, and on some two thousand necropsies and special studies of the pathology of senility. The authors have had much experience in the field discussed, and they provide a bibliography to the major references in the field. The general considerations of old age are followed by special reference to the system of the body and the changes brought about by old age in these systems. A brief section is concerned with infectious diseases. The advice is thoroughly scientific, there is little reference to the strange pharmacopeia often found in works of foreign origin. The authors have had personal experience with cases in which rejuvenation was attempted by the Steinach and Voronoff techniques. They make this positive statement: "In not one case, however, was there any ultimate evidence of restored efficiency or of continued sexual potency." Indeed, they are not even inclined to accept the claims that have been made for these operative procedures as a means of halting the advances of senility. They say "It is expedient neither to suggest their use nor to advise against them should the patient desire such operation, rather let the physician emphasize the possible hazards in overtaxing various organs. Exceptional forms of intervention may be justified in exceptional men." As far as the use of glandular therapy is concerned, they believe the results inconclusive but worthy of continued investigation.

**Conceptual Thinking in Schizophrenia.** By Eugenia Hanfmann, Ph.D., Instructor of Psychology, Mount Holyoke College, South Hadley, Massachusetts, and Jacob Kasanin, M.D., Chief, Psychiatric Service, Mount Zion Hospital, San Francisco. Nervous and Mental Disease Monographs, No. 67. Boards. Price, \$2.50. Pp 115 with 2 illustrations. New York 1942.

Vigotsky, an astute Russian psychologist, developed a test for studying conceptual thinking in schizophrenia. Like Goldstein his fundamental thesis was that in the schizophrenic ability to think in abstract concepts was lost and that regression to primitive levels of concrete individual terms occurs. Grouping of individuals is made according to complexes and not to classes. The authors have taken over Vigotsky's apparatus and tested many patients with his method. They give details of the technique, methods of scoring and analysis. The authors confirm Vigotsky in his conclusion that in the schizophrenic there is a reduction of conceptual thinking. Certain minor corrections of the Russian theory are made. For any one wishing to learn the fundamentals of the test the book is highly recommended.

## Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS BUT THESE WILL BE OMITTED ON REQUEST.

### SUPERTROPICAL BLEACH FOR GAS BURNS

To the Editor—It is requested that information regarding the preparation of supertropical bleach be forwarded to this facility. An evaluation of this substance in the treatment of gas burns (mustard lewisite) and suggestions for alternate treatment would be appreciated.

Camdr C G DeFoncy MC  
U S Naval Air Station Alameda Calif

ANSWER—Supertropical bleach is a stabilized chlorine containing compound similar to HTH prepared by the Matheson Alkali Works, Incorporated, 327 Guilford Avenue, Baltimore. It is not however, exactly the same as HTH but is stabilized by a secret process which is known to the company mentioned. It is understood that any high test bleach such as HTH itself is satisfactory for the first aid treatment of mustard or lewisite burns. The preparation is made up for use by adding one to two parts of water to the bleach powder. The early application of such bleach paste to mustard or lewisite burns is undoubtedly of value, depending on how soon after the burns occur the treatment can be carried out. There is probably no better prophylactic treatment for mustard burns than the proper and early application of bleach. However the Army Medical Corps recommends two superior forms of early treatment for lewisite burns. The first of these is the alternate and repeated swabbing of lewisite contaminated areas with sodium hydroxide solution and with alcohol. This should be instituted at the earliest possible moment. The sodium hydroxide solution is a 10 per cent solution in 30 per cent glycerin. The second method recommended by the Army is the repeated swabbing of the lewisite contaminated area as early as possible with fresh solutions of 3 per cent hydrogen peroxide. The peroxide method is even superior to the sodium hydroxide-glycerin mixture. In summary, it would be wise to have on hand sufficient quantities of high test bleach for both mustard and lewisite burns, if nothing else is available, and if possible to have sodium hydroxide and peroxide available for lewisite. Peroxide is very unstable and therefore should not be depended on entirely as protection against lewisite.

### HAY FEVER DUE TO RAGWEED

To the Editor—A woman who in the past has had hay fever from June 1 to the first fall frost was given last year cutaneous tests for oak, plantain, timothy, ragweed, cocklebur, lamb's quarters and house dust. She had a strongly positive reaction to house dust and a moderately positive reaction to timothy and the remainder were negative. She was given ten injections of mixed grosses, a dose of 1,000 units being reached and was symptom free until August 1 when hay fever started and continued until the first frost. The same cutaneous tests were repeated this year with the same results. Could you make suggestions as to the possible cause of attacks from August 1 to frost other than ragweed? Do you think it likely that ragweed is the cause with two negative cutaneous tests? Where would you fit the strongly positive reaction to house dust into the picture and how include in the treatment if necessary to include it?

Basil C Gray MD Oneonta NY

ANSWER—It is rather obvious that this patient, living in the state of New York, is ragweed sensitive. Symptoms that come on August 1 and last till the frost in that district are almost always due to the pollen of ragweed. The scratch tests for short and giant ragweed should be repeated. If these are again negative an intradermal injection with each one separately or mixed, in a dilution of 1:1,000 should be made, and will in all likelihood be positive as compared to a control test using any diluent. If the intracutaneous test is negative a small amount of raw ragweed pollen should be laid against the inner surface of the lower eyelid and left there for five to ten minutes. If the patient is allergic to ragweed the eye will become inflamed and will itch and tear. If negative nothing will happen. If this conjunctival test is negative it is almost certain that the patient is not ragweed sensitive because insertion of pollen in the conjunctival sac merely imitates what actually happens during the hay fever season.

It is possible, of course, that foods eaten in the summer only or molds may be the cause of some of the symptoms at least, but molds occur all summer long and are especially prevalent the latter part of July. They do not, however, lead to any such clearcut seasonal symptoms as does ragweed pollen. Mold tests should certainly be made. If any one of the three methods of testing for ragweed (scratch, intradermal or conjunctival) is positive, injections of ragweed extract should be started at once beginning with 0.10 cc of a 1:10,000 extract and increasing the dosages approximately 50 per cent at intervals of twice a week, with the usual precautions. As the symptoms occur from June to the first frost, it would seem unlikely that the reaction to house dust is of any significance. It need not be included in the treatment. House dust is much more of a factor in rhinitis and asthma which occur from the fall to the summer. The injections of grass extract should be started at once. Perennial treatment with extracts of grass and probably of ragweed are advised.

### EFFECT OF MERCURY VAPOR ON MAN

To the Editor—A patient reports the following analysis of mercury vapor in the air of his laboratory: 300 to 500 micrograms per cubic meter under normal conditions, an amount which can be reduced to 100 micrograms per cubic meter by proper ventilation. Can you give information concerning the toxic content of mercury vapor in air and what to do to eliminate it? I should appreciate information also on the treatment for metallic mercury poisoning.

Robert P McReynolds MD Los Angeles

ANSWER—A microgram represents one millionth of a gram. By extension it appears that a person exposed to 500 micrograms per liter of air would take into the body approximately 5 mg of mercury in a work day, assuming that 10 cubic meters of air would be inhaled during the exposure period, which quantity is probably high. Such an intake represents about five times the maximum tolerable mercury limit, since a recently proposed standard fixes tolerance at 100 micrograms per cubic meter of air. This standard in truth may be high, since by some investigators it is believed that as little mercury as 60 micrograms per cubic meter of air may lead to poisoning. An additional exposure factor possibly may be found in mercury dust that settles on the skin. By way of prevention, a number of suggestions now are made. The quantity of mercury in the air should be reduced to 100 micrograms at most per cubic meter, the spilling of mercury and other opportunities for evaporation of the metal should be avoided, mechanical ventilation should be introduced if necessary to reduce the mercury content of air to the level specified, scrupulous oral and cutaneous hygiene should be exercised, the personal use of alcoholic beverages is undesirable, and constipation should be avoided, at the first sign of poisoning all additional exposure should cease. In mining operations the spraying of certain chemicals into the atmosphere (a procedure not necessarily applicable to laboratories) is said to render the mercury content of the air harmless. In connection with treatment, no mention is made of the therapy of acute poisoning, since this is unlikely to occur under the circumstances mentioned. For chronic poisoning no drug therapy is of known value, although the use of sodium thiosulfate in doses of 1 Gm administered intravenously every second day has been advocated. In cases of chronic poisoning the manifestations resemble the symptoms of parkinsonism, and the drugs used for that disease might be of some value. The use of amphetamine sulfate in a dose of ½ grain (0.03 Gm) twice daily has been suggested. Mouth washes are usually desirable, and among others may be mentioned potassium permanganate 1:8,000, tincture of myrrh 2 per cent, thymol and potassium chlorate. Physiologically the patient with chronic mercury poisoning may profit from some of the following measures: removal from all exciting environmental influences, living in open air, with exposure to sunshine if possible, frequent periods of exercise or work, the promotion of perspiration, a high intake of water and milk, the promotion of a high urinary output and frequent stools, frequent hot baths, massage of parts showing tremors, and abundant use of foods with a known content of vitamins, particularly milk and egg. Additional information may be found in the following references:

Davenport S J and Harrington Daniel: Mercury Poisoning as a Mining Hazard. Information Circular 7189 Bureau of Mines U S Department of Interior November 1941.  
Johnstone R T: Occupational Diseases Philadelphia W B Saunders Company 1941.

## TRANSMISSION OF ENDEMIC TYPHUS

*To the Editor*—There have been about 20 cases of very severe murine typhus in my county in the past month and it seems that the rat and the rat flea are the agents of its spread. I understand that it is important to hold down the rat population through various measures, among which the cat is particularly useful. In my own house we find a mother cat more efficient than traps or poison not only because of those she has killed off but also because her presence in the house acts as a rat repellent. Usually before devouring the rat which she has caught elsewhere she brings it to the back door and requests praise. Later she enters the house to nestle up to us and our children or her own kittens. I am not clear as to how particular or specific various types of fleas are to their animal hosts such as the rat flea to the rat, the dog flea to the dog and the cat flea to the cat, and I should like to ask this question: If a cat was to catch a rat which was harboring rat fleas infected with typhus would these fleas tend to transfer to the cat during the intimate contact which exists during the almost always prolonged play that goes on before the rat is slowly devoured? Thus, could it be possible that the cat might on again returning to the household distribute a portion of the rat fleas to human subjects? There is thus the question of specificity of fleas and also the possibility in spite of specificity of haphazard occasional transference such as suggested. Most of my typhus patients give a positive reaction up to 1:640 on the Weil-Felix reaction by the twelfth day of the disease. Last February, twelve days after my third dose of typhus vaccine (total 2.5 cc), my serum was negative to this reaction. Is this the rule or might this indicate that I have not responded well as to degree of immunity? Of the 40 persons immunized, few have given the slightest local or systemic reaction. This is quite a contrast to typhoid shots.

M D, Florida

*ANSWER*—The flea usually incriminated in the transmission of endemic typhus fever from infected rats to man is *Xenopsylla cheopis*. This flea has been reported found on domestic cats. Cats have been reported as susceptible to laboratory infections with typhus fever and further to transmit typhus infection to the fleas (*Ctenocephalus felis*) which they harbor. From these reports it would appear as a possibility that the cat could be bitten by an infected *X. cheopis* flea from the rat and become infected and thus infect its own fleas. These fleas could then transmit the disease to human beings in association with the cat. The cat might also act as a mechanical transmitter of the *X. cheopis* fleas from the rat to the human being.

It must be realized that the foregoing is a theoretical consideration of the question. Actually typhus virus has been reported to have been isolated from cats, naturally infected, only by European investigators and then only on about two occasions. These observations have not as yet been confirmed in this country.

In answer to the question concerning the Weil-Felix reaction following endemic typhus vaccination, it must be stated that studies along these lines have not as yet progressed to the point where generalizations can be made. Why not make the Weil-Felix test on the 40 persons already immunized, as well as on those who are vaccinated in the future?

## ASYMPTOMATIC NERVOUS SYSTEM SYPHILIS

*To the Editor*—A white woman aged 32 was discovered to have a 4 plus Wassermann reaction at the time of delivery of her second child. The blood from the umbilical cord gave a negative Wassermann reaction but seven days later was 1 plus. Blood tests at the time of delivery of her first child, two years before, were said to be negative. Physical examination was negative except for moderate deafness in both ears, which was first noted at the age of 14 and which has progressed ever since. Her husband and first child had negative Wassermann reactions. She did not have any knowledge of contact during the two years in which the disease was apparently contracted. Treatment with neoarsphenamine and bismuth compounds was begun, but after four months the Wassermann reaction was still 4 plus. No Wassermann test was done at the time of delivery of the first child. After the second child, two years later, the test was 4 plus. A spinal puncture was done at the same time and was found to give a 4 plus reaction. Central nervous system symptoms were absent, but the history of deafness starting at 14 suggests the possibility of congenital syphilis. Tryparsamide was given but was not tolerated and was stopped after four weekly injections of 2 Gm each. The spinal fluid at this time was plus and showed a normal colloidal gold curve. Why is the reaction on the blood of the father and the first child consistently negative? Is this congenital syphilis? How may I proceed with the treatment? What amount of fever therapy is indicated?

M D, Milwaukee

*ANSWER*—This patient apparently has asymptomatic central nervous system syphilis. It is difficult to see how she would have been delivered of a child that has congenital syphilis if she herself had congenital syphilis. Third generation syphilis is exceedingly rare, so much so that the patient would have to satisfy some pretty severe criteria before that would be allowed.

It is quite possible for a person with late syphilis to be delivered of a child that is normal and then to have a second child that is suffering from congenital syphilis. It means that their disease is more or less of a latent character and that only now and then are there spirochetes in the blood stream. This

may well happen in connection with pregnancy, and the fetus the second time was infected thereby.

Moreover, such a person may well be married and be able to transfer the disease to the next generation and yet the husband may not be infected. It would be rather unusual for such a person to have acute relapse manifestations of a contagious character through which the husband could be infected. If this individual should be used as a donor in transfusions there would be grave danger of transferring the disease.

As to her treatment, it is unfortunate that more exact data are not furnished. Nothing is said about the cell count on the spinal fluid or of the globulin reaction, and little is furnished as to how careful a neurologic examination was made.

The patient should be given a course of fever therapy either with the fever machine or with malaria and, of course, this should be done by an expert who is perfectly familiar with the procedure and with the dangers connected with it. Following this her eyes should be examined very carefully from the standpoint of visual and color fields and if there are no contraindications she might be started on a course of tryparsamide, beginning with a dose intravenously of 1 Gm, the injection being given slowly and increased 0.5 Gm at a dose up to a maximum of 2.5 Gm, the injections being given once a week for a series of twenty-five injections.

With the first injections of tryparsamide the patient should be watched very closely and questioned as to any untoward manifestations in connection with the eyes. Naturally, if she does not stand this therapy well it may be necessary to use alternating courses of arsenicals and bismuth compounds in place of the tryparsamide and in such a case one might employ neoarsphenamine in doses of 0.6 Gm once a week for a series of ten injections, to be followed with an alternating course of intramuscular injections of bismuth subsalicylate once a week for a series of ten treatments.

In view of the importance of the situation in this case, it would seem advisable to have a consultation with some one in the inquirer's part of the country at the end of this time. It is difficult, in fact almost impossible, to outline the course of therapy that should be followed for such a patient for a longer period than six months.

## ELECTRIC SHOCK THERAPY

*To the Editor*—What is your opinion as to the present status of electric shock treatment for mental disorders? I have been consulted as to its value in a man of 50 who has been diagnosed as having general arterio sclerosis and in the last months has shown definite mental deterioration. He exhibits sexual perversions and definite changes in his normal behavior pattern which have necessitated his institutionalization. The institution in which he is confined has advised electric shock therapy. Before rendering judgment on this case I would appreciate your advice in the matter.

Nelson Clark Walker, M D, Hockensock, N J

*ANSWER*—The electric shock treatment for mental disorders has largely replaced, in the last year or two, the use of insulin or metrazol to invoke a "shock." This is partly because, by the electrical method, the dosage is easily controlled, a factor long a deterrent in the use of other forms of stimulation. The dose can be graded until the best results are obtained without injury to the patient. Reports from various sources indicate that the effects produced on mental disease by electric shock are just as good as those from insulin or metrazol. The method, therefore, can be used with a considerable degree of safety if employed by expert hands.

It is more difficult to decide whether a man of 50 with general arteriosclerosis and mental disease characterized by sexual perversions should be subjected to this treatment. In general, arteriosclerosis is considered to be a contraindication for any sort of shock treatment, exceptions must always be made, depending on the amount of arteriosclerosis, the condition of the blood pressure, the general health of the patient and the persistence of his mental abnormalities. If arteriosclerosis is causing a permanent and progressive mental degeneration, no form of shock treatment is likely to be efficient. Such an estimation of the patient's condition should be made only after six months of observation in an institution, in the meantime the ordinary employed forms of psychotherapy being used. If such treatment fails, electric shock should be taken into consideration as a second step.

All these factors must be carefully evaluated. More than one consultant may be needed. In general, one would feel that if the patient is under good institutional care the advice given by the psychiatrist in charge should have the most serious consideration in the final decision.

A review of the various types of shock and an estimation of their efficiency up to 1941 will be found in *Shock Treatment in Psychiatry*, by Lucie Jessner and V. Gerard Riva, New York, 1941.

### TREATMENT OF SYPHILIS IN SEAMEN

*To the Editor*—In the management of active syphilis in seamen what is the shortest possible time to keep them from returning to sea and what type of treatment schedule should one employ? What is the answer to the same questions in the case of latent syphilis? Because of the war early return to sea is very important and stops between ports are at intervals of about three weeks or more.

A. J. Reich, M.D., New York

**ANSWER**—The ideal treatment for active syphilis in seamen would be the use of the intravenous drip, but as this is still in the experimental stage it does not seem wise to recommend it.

In acute syphilis intravenous injections of mapharsen are recommended three times a week for three weeks, and in this period give the patient a weekly injection of bismuth subsalicylate 2 cc intramuscularly.

For the three weeks that the men are going to be on the ocean it is recommended that they be given sobisminol mass 2 capsules three times a day. On their return it probably would be possible to get them to stay for one week and give them three more intravenous injections and one injection of bismuth subsalicylate intramuscularly. As they go out to sea again, the same procedure should be employed with sobisminol mass.

By alternating these treatments it would be possible to give the patient twenty-four injections of bismarsen within a period of six months, after which there seems to be no reason why it would not be practicable to have them use the sobisminol mass while they are on the sea and get an injection of mapharsen and bismuth subsalicylate once on their return, rather than giving them three times during a week.

This therapy might then be kept up for a year after the serologic tests have become negative and provided the lumbar puncture examination is also negative.

With latent syphilis, the patient may be given an injection of mapharsen 60 mg intravenously and an intramuscular injection of bismuth subsalicylate 2 cc of the 10 per cent suspension in oil and be asked to use 2 capsules of sobisminol mass three times a day for the three weeks that he is at sea. Each time that he returns he might receive an injection of mapharsen intravenously and of the bismuth subsalicylate intramuscularly.

This therapy could be kept up for a period of eighteen months, following which he could be given two courses of four months each twice a year for the succeeding two years.

Sobisminol mass is an expensive preparation, and a certain number of persons have some gastric discomfort from it. However, if it is taken in the middle of the forenoon, middle of the afternoon and about 8 o'clock at night with plenty of water, the average person will have no difficulty. The urine of these patients should be checked from time to time to indicate whether there is any evidence of irritation of the kidneys.

### POSTANESTHETIC ALOPECIA

*To the Editor*—Some women who have had anesthesia for an operation or at the time of delivery frequently remark "I can't do a thing with my hair since I took ether." Others state that their hairdressers refuse to give them permanent waves because they had recently had anesthesia. Still others state that their hair has fallen out excessively after anesthesia. What is the explanation for the unruliness and falling of the hair? Is the anesthetic directly responsible or is there a metabolic disturbance associated with pregnancy or illness which is responsible? If the anesthetic is responsible is there any difference in the effects of ether, ethylene and cyclopropane on the hair?

M.D. Florida

**ANSWER**—Perhaps ether anesthesia can cause a change in the hair of some persons, especially women, for they are much more susceptible than men to such influences on hair growth. Aside from pregnancy, which is one of the commonest causes of temporary symptomatic alopecia, other well known etiologic factors, such as influenza, typhoid and other febrile diseases and surgical operations cause it in more women than men. However, in ascribing blame for the alopecia one should not dwell on the anesthetic when anesthesia has been occasioned by pregnancy or by an operation for the relation of these factors to loss of hair is well established and at present there is no proof that changes in the hair have been caused by ether anesthesia or by any other form of anesthesia.

The loss of hair comes on from one to six months, most often two to three months, after the causal event, so the alopecia should not be ascribed to a recent event. Beau's lines, furrows across the finger or toe nails, may appear at the same time. Additional evidence of the disturbance of circulation or of metabolism causing the alopecia.

### SCARLET FEVER IMMUNIZATION

*To the Editor*—What is the present status of scarlet fever immunization for exposed persons and for routine immunization for the preschool child? If the prophylactic dose of serum is used on exposed persons, how long does the immunization persist?

J. Leland Fox, M.D., Seaford, Del.

**ANSWER**—Passive immunization against scarlet fever has not yielded consistently satisfactory results. Though antitoxin appears to be effective as far as protection against toxic effects are concerned, its use has not been very general, since it may produce serum reactions as uncomfortable as a mild form of the disease and frequently leaves the child sensitive to horse serum. Convalescent serum is free of these objections, but the data as to its effectiveness against anything other than the toxemia of the disease are not conclusive.

It would appear that active immunization against the toxic elements of scarlet fever is effective. The injections are attended with somewhat more uncomfortable reactions than following diphtheria immunization. While toxin immunization gives a high level of protection against clinically recognizable scarlet fever, there is no good evidence that the immunization gives equal protection against the infectious component.

No program of immunization thus far has been carried on long enough and on a sufficiently extensive scale to yield satisfactory evidence as to the value of the procedure for routine use in the preschool child.

It is presumed that the prophylactic dose of serum may produce immunity for as long as two to four weeks.

### THERAPY OF GLIOMA OF THE BRAIN

*To the Editor*—A woman with an infiltrative gliomatous brain tumor of the parietotemporal region was operated on approximately two months ago. The tumor was only subtotally removed and immediately after the operation residual tissue was treated by intensive radiotherapy but to no avail as the tumor has recurred. Is any experience with Coley's fluid in a similar situation familiar to you? What is the status of injectable radioactive liquids and where can they be obtained?

M.D. New Jersey

**ANSWER**—Up to the present nothing has been found to replace surgical intervention in the treatment of brain tumors. High voltage roentgen therapy may give temporary relief to the patient whose infiltrative gliomatous tumor cannot be completely removed surgically. Intensive and repeated doses are, however, necessary. Results depend on the histologic nature of the glioma. Glioblastoma, which is the most frequently encountered glioma, is only moderately sensitive to irradiation, other types of glioma do not respond at all. Direct irradiation or the insertion of filtered radium applicators into the tumor has not as yet demonstrated any superiority over therapy administered through the normal surface tissues.

Radioactive liquids, such as thorotrast (thorium dioxide), are useful as a diagnostic procedure, they have, however, no therapeutic value as they do not leave the blood stream. Intravenous injections of radon produce extensive destruction of leukocytes, even complete aleukia, and have no effect on malignant tumors. Experience with Coley's fluid and reports as to its usefulness in the treatment of intracranial neoplasms are not available.

### TETRYL AND LEAD AZIDE POISONING

*To the Editor*—Several patients employed in a local munitions plant most of them women have duties involving the handling of tetryl and lead. Soon after handling these substances which are used in the making of bomb fuses they have a yellowish discoloration of the skin and a few days later a small lenticular vesicular eruption surmounting an erythematous base. Some of the workers complain of bronchial irritation. Some complain of a metallic taste of their food. Can you give me any suggestions regarding these conditions?

William J. Sigmund, M.D., Bradford, Pa.

**ANSWER**—"Tetryl" is another name for 'furan' or 'furfuran' a relatively innocuous substance. It is not known that this material is used in fuse priming. It is assumed that the actual substances used were 'tetryl' and either lead azide or lead styphnate. However, if these assumptions are in error, none of the statements which follow may be applicable. Tetryl is picrylmethylamine or for short "nitramine." In its manufacture (not here described) several opportunities arise for poisoning, burns and dermatitis from various intermediate products. When in the dry, powder form, as well as when mixed with diluting materials, such as acacia it is a well known cutaneous irritant and discolors the skin. Tetryl produces the yellow characteristic of picric acid as well as an orange staining. As described by Schwartz the lesions are

erythematous and papular with vesication. Lesions are commoner at points of contact, including the elbow fold and neck area. Patch tests with 0.5 tetryl in alcohol may yield positive results in twelve to twenty-four hours. Exposure to tetryl is fully capable of inducing systemic disease, as best described by Noro (Untersuchungen über die Triotyl-, Tetryl- und Knallquecksilber-vergiftungen bei den Arbeitern der Munitionsfabriken Finlands, reviewed in *THE JOURNAL*, Dec 13, 1941, page 2109). Exposure both to lead azide and to lead styphnate may lead to systemic disease as well as to dermatitis. The dermatitis from the azide is rare but possibly more severe than that from the styphnate. The styphnate has the property of turning the skin and hair yellow. Among the three substances mentioned probably may be found the cause of the dermatitis mentioned in the query and of the other manifestations, such as the metallic taste. The exposure should be brought promptly to the attention of whatever military agency is concerned with this enterprise and in addition to the attention of the state department of health.

### FRIEDREICH'S ATAXIA

To the Editor—Your explanation of the inheritance of Friedreich's ataxia in *The Journal*, February 28, page 770, seems to me to be a bit queer, because you say if "the disease is dominant or recessive on a simple mendelian basis, it would be transmitted to the next generation in at least a proportion of three to one." This would be true only if the trait was dominant and the afflicted brother and sister married each other or married partners with the disease. In the case of rare dominant traits, those afflicted are heterozygous and the expectation is that half their children will inherit and show the trait. If the disease is recessive in this brother and sister they are both homozygous, and if they married normal partners all their children would inherit the trait, but none would show it.

William Allan, M.D.,  
Bowman Gray School of Medicine, Winston-Salem, N.C.

COMMENT—Russell Brain too found it difficult to explain the inheritance of hereditary ataxia in all cases on a simple dominant or recessive. He suggested that the disease "depends on the coexistence in the germinal material of two factors, one of which behaves as a dominant and the other as a recessive. In order to manifest the disease an individual may be either homozygous or heterozygous for the dominant factor but must be homozygous for the recessive. It is further assumed that the dominant factor is a mutant arising in the affected family, while the recessive factor, which by itself even in homozygous individuals does not cause the disease, is relatively common in the general population. This hypothesis explains the transmission of the disorder through normal individuals, who carry the dominant but are heterozygous for the recessive factor, and also its occurrence in the offspring of marriages of members of an affected family with members of a population in which the disease is rare. It is further supported by the proportion of affected offspring derived from the marriages of affected and from those of normal members of families in which the disease has appeared. No other hypothesis appears capable of affording a satisfactory explanation of the peculiarities of the inheritance of this disorder on mendelian lines. The only alternative is to assume that the disease is transmitted as a mendelian dominant but that its manifestation may be suppressed in certain cases by some unknown environmental factor (Brain, W.R. *Hereditary Nervous Disorders, The Chances of Morbid Inheritance*, edited by C.P. Blacker, Baltimore, William Wood & Co., 1934, p. 48).

Finally, even as Dr. Allan has pointed out, the trait may be inherited without clinical signs, is it therefore wise for the brother or sister to marry? The answer in all instances should be no.

### VIRUSES IN DRINKING WATER

To the Editor—Is there any way to test drinking water for viruses?

J. A. Schurgot, M.D., Grafton, Ohio

ANSWER—As far as is known, but few virus diseases are spread by means of water. There are two possible exceptions, namely poliomyelitis and swimming pool conjunctivitis. The virus of poliomyelitis has been found in human feces and sewage. At least one worker, Kling, has reported finding the virus in drinking water (*In Search of Poliomyelitis Virus in Drinking Water, Internat. Bull. Econ. M. Research & Pub. Hyg.* A 40 161, 1939), but this observation needs confirmation. There are definite ways of detecting viruses in water, for instance the injection of the unaltered water or concentrated water into animals susceptible to the virus suspected of being present. If the water is highly contaminated with bacteria they can be removed by filtration without appreciably interfering with tests for viruses. Workers making such tests must be thoroughly familiar with viruses and the methods of detecting and handling them.

### REFRACTORY GONOCOCCIC INFECTION

To the Editor—On Feb. 2, 1942 a woman aged 26, presented herself at the office because of profuse purulent vaginal discharge. Bacteriologic examination of urethral and vaginal smears disclosed innumerable pus cells loaded with streptococci, staphylococci and a moderate number of intracellular gram-negative diplococci. Cervical smears contained only mucus. Sulfathiazole 30 grains (2 Gm.) daily for ten days and 45 grains (3 Gm.) daily for another two days was given. Local treatment consisted of estrone suppositories 2,000 units daily. The latter were administered with a view to the vulvovaginal type of the disease and the infantile appearance of the genitalia. Sulfathiazole was apparently well tolerated at first under steady control of the blood status, but on the thirteenth day a severe drug rash with fever occurred. On the twentieth day the discharge was mucus only, and neither pus cells nor organisms of any kind could be found in the smears. Now mixed vaccine for gonococci, streptococci and staphylococci was administered in two doses of 0.1 and 0.2 cc subcutaneously on the twenty-eighth and thirty-third day respectively. There was no reaction on the first injection, but two days after the second injection the discharge suddenly reappeared and the smears are now loaded with gram-negative diplococci. Streptococci and staphylococci are no longer visible. I initiated a course of sulfadiazine but am skeptical of the outcome. What more can be done if the effect of sulfadiazine is insufficient or if there is another relapse? Would artificial fever give better chances, and if so in what form? The boy friend is being treated elsewhere for chronic gonorrhea. I am fairly sure that there has been no intercourse since February 2. I would appreciate whatever advice you might be able to give and also your opinion as to whether it was unwise to administer the vaccine at that stage.

M.D., Massachusetts

ANSWER—In event of the sulfadiazine therapy failing to effect a clinical and bacteriologic cure, it is suggested that, after a rest period of approximately two weeks, the patient be treated by the combined sulfathiazole and artificial fever method as outlined by Simpson (*Brit. J. Ven. Dis.* 17 185 [July-Oct] 1941). A similar article by the same authors appeared in *War Medicine* 1 470 [July] 1941).

### LUMPY BREAST

To the Editor—Kindly advise as to the diagnosis and therapy of the breast of a 25 year old multipara who eighteen months post partum began to have an aching and lumps in both breasts with the secretion of a watery milky solution. The breasts contain a few small hard lumps which on pressure are slightly tender, and there is retraction of the left nipple as a consequence of its attachment to the area of mastitis.

M.D., Manitowoc, Wis.

ANSWER—The age is against cancer, but this diagnosis can not be excluded on the basis of age. The presence of multiple tumors is evidence against cancer, but the retraction of the nipple favors the diagnosis of cancer. Congenital retraction of the nipple has to be excluded in this case. If the retraction of the nipple is not congenital and is a consequence of attachment of the tumor to the skin, cancer has to be excluded by biopsy and frozen section. The interpretation of conditions of this type is exceedingly difficult even after careful examination of the patient. Consultation with some one experienced in this clinical condition is required in this case.

### CHLORINATING WATER

To the Editor—What is a practical method of chlorinating water for a camp on a lake to make it potable?

Robert E. Cloud, M.D., Ensley, Birmingham, Ala.

ANSWER—There are several reliable manufacturers of chlorinating equipment for small camp water supplies using calcium or sodium hypochlorite solutions as the disinfecting agent. The type of installation will depend on the type and size of the water system involved. The equipment applies the hypochlorite solution in prescribed quantities in proportion to the pumpage or flow of the water in the local system. The appliances may be operated either manually or automatically, the latter being somewhat more expensive. In the water works trade, appliances of this kind are known as hypochlorinators.

### HEREDITARY TRANSMISSION OF ALLERGY

To the Editor—A woman who suffers from hay fever and whose husband has the same type of hay fever is very desirous of having children. She would like to know what the probabilities are for her children to have hay fever, eczema or other forms of allergy.

M.D., Ohio

ANSWER—When both parents have major allergy as described here, statistics indicate that from 65 to 70 per cent of the offspring will have some form of allergy. In the majority cited in the query, children may, of course have other allergic manifestations such as asthma or eczema in addition to the probability of hay fever.

## THE URGENT NEED FOR DOCTORS

PAUL V McNUTT  
Federal Security Administrator  
WASHINGTON D C

Long before Pearl Harbor the American Medical Association established a Committee on Medical Preparedness. Long before America as a whole was ready for the total mobilization of its manpower, your committee undertook a census of physicians and visualized a plan for matching physicians to the needs of a nation at war.

The Procurement and Assignment Service was established at the suggestion of the American Medical Association. Your association it was that worked out with the Selective Service authorities the plan for deferment of medical students and interns. Largely through your help medical education has been adjusting itself to war needs.

I need not call the roll further. I need not cite your collaboration with the Office of Scientific Research and Development and the National Research Council and many other professional groups. Through THE JOURNAL you know the work that your association has done. But it is my privilege to have worked with you and my pleasure to congratulate you on your vigorous action. No other part of the total manpower job is so well blueprinted today as is the mobilization of medical service.

It is fundamental that I acknowledge the work you have done, for I am about to deliver a very serious speech. Whatever the physical circumstances may be, it is not the kind of speech usually thought of as an "after dinner speech."

This is war. And war has brought to every American obligations so heavy that we have not yet realized the fundamental sacrifices that we must make.

In every walk of life manpower needs are being studied. Every American will be called on to do whatever is necessary to achieve victory.

America has selected your sons and your neighbors' sons for service with a citizen army. That army is fighting beyond the seven seas in order that America may be quite certain that we shall never have to fight on our own beaches. To establish the security of the American Way, we are risking the lives of our young men for victory.

And I need hardly tell you that no limitations of convenience or economic interest shall stand in the way of giving them full and complete support at home.

That is a commitment from us to every man in the military forces—a commitment which was implicit in his enlistment or selection.

In determining what is necessary we are now engaged in the total "diagnosis" of America's manpower needs.

And when the "diagnosis" is complete, the "treatment" of each worker and the disposition of each case will be based on our best and most objective analysis of the facts.

No labels will stand in the way. No a priori theories of political or economic organization can stand in the way of effective action. Those principles which support effective action will stand. Any others will have to suffer a moratorium.

In doing that we are taking a leaf from modern medicine. You probably still know among your colleagues—as I do not—certain cloisters of the mind which limit their objectivity but in general the old barriers of doctrine—the homeopaths versus the allopaths—have passed away. As T V Smith has put it, these "paths, like the paths of glory, lead only to the grave." No obstructive hedge of theory must stand between the patient and the doctor's best professional skill.

This is war. We are out of the cloisters of words. We must look squarely at the facts. Let me describe some of the symptoms of our case on June 8, 1942.

Let me present them simply in terms of a series of hard unpalatable facts. Whatever the state of other skills, professional and otherwise, in the reservoir of America's manpower yours is a profession which can face the facts.

1. We are not getting enough volunteers. We are not getting as many volunteers as the Procurement and Assignment Service expected we would have by this time. It is absolutely necessary that there is an immediate and significant increase in the number of volunteers, or else some other method of procurement will be required soon.

Slightly more than 3,000 physicians, who were not obligated by reserve commissions, volunteered in the first six months of this war. By contrast, 12,000 volunteered in the first six months of the last war.

An army of 9 million will take 12 per cent of our male population. Present medical corps ratios indicate that the armed forces will require 33 per cent of all our physicians (including retired men)—two-thirds of all those under the age of 45.

Several thousand physicians are needed by July 1 and more physicians must be drawn into the service in the next six or seven months than the 22,000 taken during the past eighteen months. Another 10,000 will be needed in 1943.

Some states are ahead of their reasonable and expected quotas. Others are from hundreds to thou-

sands behind their quotas. There is evidence that there are still some areas in America which have not yet fully discovered the war.

This is no statement of opinion. This is a statement of some very hard facts. I deliver them without the slightest hint of bedside manner for your earnest consideration.

2 And remember this. The Army and Navy are not the whole story. There is yet far too little consciousness of any problem beyond that of obtaining physicians for the Army and Navy. The acute need for civilian service is not yet appreciated. There will be no "business as usual" for physicians at home—any more than there can be for the physicians in the military service.

The American Medical Association's Council on Industrial Health and Dr. Selby's Committee on Industrial Hygiene, Health and Medicine have aided in the establishment of many industrial medical services. They have helped to create educational programs to train physicians for such services.

But for the most part that development has been directed to large plants. There is no well recognized plan as yet for the small plant. The more general recommendation of "cooperation with local practitioners" is not enough. It has not produced results.

And as industrial physicians have so often reminded the people, industrial health does not begin and end at the factory gates. Home and community sickness cost America more man-days in time lost than do occupational accidents and occupational illnesses. The home and the community, therefore, cannot go unserved in wartime.

Dr. Lahey and Dr. Abell, and those who appreciate the great responsibility of American medicine, know and understand these needs. It is time, I think, for a concerted drive to bring home to every doctor the importance of the local civilian problems of medical care in boom areas—a drive that will bring the necessary action.

Let me underscore the need for doctors in industrial areas and in defense boom towns. The community that is growing, as some communities have, from a rambling rural village of a thousand people to a town of 30,000 and 40,000 or 50,000, must be taken care of. Doctors will have to be assigned to those towns on a voluntary basis or on some other basis.

3 There is and there will be a growing problem of rehabilitation. Mechanized warfare means more casualties, despite all physicians and engineers can do. Perhaps there will be fewer deaths but more mangled fingers, injured arms, crippled legs.

With mechanized equipment the industrial process is multiplied manifold. With high pressure production accident rates go up. Thus, added to our training and our battle front casualties, there will be a vast increase in industrial casualties.

The casualty prospect adds to the acuteness of our need for doctors in the military forces. It adds greatly to our need for doctors on the industrial front. And there is the added responsibility for rehabilitation which arises out of the nature of total war. We need every man-hour on the production line—and therefore we need every man-hour of medical service.

We face a sad prospect. Total war has made a fundamental change in our attitude toward the disabled. We

can no longer regard rehabilitation as a humanitarian or "welfare" measure designed to salvage self respect or provide incidental income for the disabled individual. He is a person—a valuable person. He must be rehabilitated and vocationally trained not merely for his own good but because the nation needs him. He must be vocationally trained not in some obscure handicraft the products of which are intended for Fifth Avenue shops or roadside tourist stands but in skills that will fit him for a place in the main stream of American production. Industry must not disqualify him for his disabilities, it must qualify him for his abilities.

Thus the rehabilitation problem includes not only the rehabilitation of rejectees but the rehabilitation of men who suffer their disability because they served their country in the military service or on the production line.

4 A total systematic plan is necessary to meet these needs. Manpower must be conserved now.

But I think the situation presents to the American medical profession an opportunity. You are familiar with the advances in clinical medicine which came out of the last war. You know the advances in bone surgery and plastic surgery and in the care of wounds. You know full well the height to which your profession rose under the terrible pressure of war. You are faced with even greater and more challenging problems now. You will rise to new heights, which will be all the higher because in this last quarter of a century you have developed so beautifully in medical education and scientific research.

In addition, however, to your problem of the last war you face the acute social problem presented by total war. There must be no break anywhere in the fabric of our national effort. Those breaks come only when America's fundamental resources, the health and vitality of its people, break down.

Just as clinical medicine progressed in 1917-1918, this time America can look forward to your firmer mastery of the management of its medical services. I hold no brief for any a priori plan. I hold a brief only for the application of the same scientific objectivity to problems of the organization and distribution of medical services as they are applied to clinical questions.

That will serve to outline America's main problem. Here are some of the prescriptions which are indicated.

1 For the military services younger men must go. They must realize their duty now. The armed forces need thousands of young doctors immediately—to be exact, 5,000 by July 1, 20,000 during the next seven months.

They must make whatever arrangements are necessary for their older associates to handle their practices. The older men in turn must remember that they had their chance last time. They not only must stay but must extend the scope of their activities to meet the medical needs of the civilian communities.

2 The medical profession must cooperate in every local community as vigorously as your national organization is now cooperating. It must obtain physicians in sufficient numbers for the Army and Navy. It can and must take action to allocate men to important positions in industry and in civilian life. Having accomplished these two important military duties, the profession should certainly have no fear of any drastic change in medical practice after the war.

3 Let me make this clear. The Procurement and Assignment Service for the War Emergency was set up in collaboration with the medical profession to facilitate the channelling of physicians to military and civilian service. It will not continue after the war. "All out" collaboration does not involve any theoretical assaults on, or support of, any theory of medical practice.

The Procurement and Assignment Service, with which every physician should and must collaborate to the full, is staffed by physicians guided by physicians and represents every one of you in the worldwide application of the simple but profound obligations of the Hippocratic oath.

There was nothing of theory in the establishment of the Procurement and Assignment Service. It was a proposal to solve in a practical manner a problem of great urgency. It was not imposed by the government. It was set up, I repeat, at the suggestion of your profession. It investigated all aspects of the problem of providing doctors in an equitable way for military and civilian service. It made the arrangements with Selective Service for the deferment of medical students. It has safeguarded your professional interest in every way.

At the same time it has accepted the obligation to deliver the doctors that the nation needs to the points at which they are needed.

Now let us look at the record.

The plain fact and conclusion is simply this. The Army and Navy and the war industry areas have not gotten the doctors they need. The careful safeguards that were set up by the Procurement and Assignment Service have apparently slowed down the rate of recruitment. The voluntary plan must work and work promptly—or some other more vigorous plan will have to be produced.

Yours has been an outstanding effort in canvassing and classifying every member of your profession. You have still in your hands the machinery by which a self-governing profession can demonstrate its ability to meet the tremendous demands of total war. And I appeal to you to make that machinery work.

Yours is an important profession. It is the first to require rationing—rationing which will make sure that there are enough doctors to meet the needs of every unit of the home front and of the battle front. The issue is who shall do the rationing, for America must have the doctors it needs.

---

**General Practice Requires Brilliant Men**—There is an idea abroad that medical men drift into general practice because there is no place for them anywhere else. This idea should be disabused. Only brilliant men should go into general practice. In no other field of medicine is competition so keen and in no other field of medicine are the keenest mental qualities required for success. The sphere of general practice is not the place for mental or physical weaklings. In it you work amongst the people. They know you personally. Your mistakes are made public and are discussed by all. The general practitioner's mistakes are not hidden under a bundle of pathological and x-ray reports but are discussed in the local public house and at the church on Sunday. It will not bring big financial success but it brings better things. It brings friendships which are life-long. No other branch of the profession gives such a full life—a life full of real living and of service. Therefore if you decide to take up general practice do so with the knowledge that there the greatest field for service as a doctor is open to you.—McCann J. J. *The General Practitioner Looks at Medicine* *Irish J. M. Sc.* June 1941.

## HIGH FAT DIET PRECEDING CHOLECYSTOGRAPHY

A REVIEW OF THE LITERATURE AND EXPERIMENTAL STUDIES ON FILLING THE NORMAL GALLBLADDER

HOWARD CURL, M.D.

MEMPHIS, TENN.

Eighteen years have elapsed since Graham and Cole<sup>1</sup> first reported the use of tetrabromophenolphthalein sodium, by intravenous injection, in the examination of the gallbladder. This added impetus to the study of the liver and biliary apparatus which not only increased the accuracy of diagnosis of pathologic conditions but greatly increased our knowledge of the physiology of these organs.

The interpretation of roentgenograms in which the gallbladder shows only a faint or no shadow has, from the beginning, been unsatisfactory. As early as 1925 Stewart and Ryan<sup>2</sup> concluded, after a series of experimental observations, that the question of "no shadow" needed further study. They gave five reasons why the gallbladder might give no shadow on roentgen examination. Others have since added to this list. Considering only those conditions which might interfere with the proper filling of the normal gallbladder I suggest the following:

- 1 Failure of absorption from the gastrointestinal tract of an adequate amount of the opaque medium
- 2 Failure of the liver to excrete the dye into the biliary passages
- 3 Pressure on the cystic duct.
- 4 Gallbladder already filled with bile to the exclusion of an adequate amount of fresh dye laden bile
- 5 Reflexes from the cecum, colon or other part of the gastrointestinal tract
- 6 Premature emptying of the gallbladder

### LITERATURE

A sizable literature has accumulated pertaining to the influence of the aforementioned factors in filling of the gallbladder. Brief reference will be made to only a few of the most pertinent studies which have appeared since the introduction of opaque mediums in cholecystographic examinations.

**Absorption**—The gallbladder shadow will depend not only on the size of the dose but on the amount retained for a period long enough to permit maximum absorption. Graham, Cole and Copher,<sup>3</sup> using the intravenous method gave 3.5 Gm. of tetrabromophenolphthalein. This has come to be the average dose of soluble iodophthalein when given by mouth. Sosman, Whitaker and Edson,<sup>4</sup> by intravenous injection of soluble iodophthalein, gave 0.04 Gm. per kilogram of body weight. Stewart and Ryan,<sup>2</sup> using an Einhorn tube, instilled 40 grains (2.6 Gm.) directly

From the Division of Anatomy, University of Tennessee College of Medicine.

This study was made possible by a grant in aid by the Committee on Scientific Research of the American Medical Association.

into the duodenum. Menees and Robinson,<sup>5</sup> the first to use tetrabromophenolphthalein by mouth, gave 0.05 Gm per kilogram of body weight. They stated that satisfactory shadows could be obtained with only 0.03 Gm but that it was better to have an excess to compensate for poor absorption. The following doses are all for soluble iodophthalein given orally. Stewart and Ryan<sup>7</sup> gave 40 grains for 150 pounds (68 Kg) of body weight. One patient showed an excellent shadow after only 15 grains (1 Gm). They thought that in general the doses used were too large. Sosman, Whitaker and Edson<sup>1</sup> gave 5 grains (0.32 Gm) for each 10 to 12 pounds (4.5 to 5.4 Kg) of body weight. Kirklin<sup>6</sup> gave 4 Gm regardless of weight. The Friedmans<sup>7</sup> administered, in multiple doses, from 6 Gm for patients under 100 pounds (45 Kg) up to 12 Gm for patients over 150 pounds. Whitaker<sup>8</sup> divided 8 to 10 Gm into two doses. Phillips<sup>9</sup> divided 90 grains (5.85 Gm) into three doses. Collins and Root<sup>10</sup> gave 7 Gm in divided doses and Robinson<sup>11</sup> 4 Gm in a single dose.

**Retention**—Vomiting within from one-half to one hour or a copious watery diarrhea within one or more hours frequently follows the oral administration of soluble iodophthalein. Sometimes both occur. In many of the cases in which one or both of these conditions occur, nevertheless, satisfactory gallbladder shadows are obtained. This might mean that the dose is too large or that absorption takes place very rapidly. Fantus<sup>12</sup> preceded the dye with a hypnotic to prevent emesis and followed with powdered opium to prevent diarrhea. Robinson<sup>11</sup> gave 1 drachm (3.7 cc) of paregoric one-half hour before the dye to allay the nausea and to retard the passage through the gastrointestinal tract, thereby promoting absorption. This technic is now followed by many roentgenologists.

**Reflexes Influencing Liver Eviction**—That the liver, although normal, may fail to excrete the opaque dye has been demonstrated by Goldman and Ivy.<sup>13</sup> In experimental animals they proved that stretching the colon inhibited the flow of bile from the liver. A similar response was obtained after stimulating the central end of the colonic, pelvic, inferior and superior mesenteric nerves, but the inhibition was not present when the hepatic nerves had previously been severed, thereby demonstrating a reflex inhibition of hepatic secretion. Fantus<sup>12</sup> thought absorption took place mainly in the region of the cecum and proximal colon and that stasis in this region prevented absorption. Inability to obtain satisfactory shadows under these conditions may well have been due to reflex inhibition

of hepatic function. Lahey and Jordan<sup>14</sup> found that functional disease of the colon interfered with gallbladder filling, but Ferguson and Palmer,<sup>15</sup> Kirklin and Blake<sup>16</sup> and Good and Kirklin<sup>17</sup> concluded that extra-biliary disease did not interfere with normal gallbladder function.

**Gallbladder Emptying**—Early in his work, Stewart gave his patients a meal containing large amounts of fat before giving the soluble iodophthalein, believing that this would partially or completely empty the gallbladder and render it "receptive" to the opaque bile. Sosman and his co-workers<sup>1</sup> found that fats would empty the gallbladder in from three to six hours, that lean beefsteak had a moderate effect and that carbohydrates and the sight, taste and smell of food had no effect. Boyden,<sup>18</sup> in extensive studies on the response of the human gallbladder to food, found that egg yolk was most effective, causing complete emptying within two and one-half hours. Meat gave the same pattern but was so slow that the organ began to refill before it had been completely emptied. Krause and Whitaker<sup>19</sup> found that fats and fatty acids were by far the most effective and that carbohydrates had no effect at all.

In 1928 Ivy and Oldberg<sup>20</sup> demonstrated that cholecystokinin, a hormone liberated in the upper part of the intestinal tract, was responsible for the contraction and evacuation of the gallbladder. Crandall<sup>21</sup> found little tendency toward spontaneous emptying of the gallbladder in fasting human beings and observed that a patient on a carbohydrate diet showed very slow emptying over a period of twenty-four hours. He concluded that liberation of cholecystokinin by the action of fats or acids was responsible for gallbladder activity. In a later study Ivy<sup>22</sup> demonstrated that cream and egg yolk when introduced directly into the duodenum had no effect on gallbladder contraction but that pancreatic digests of these same substances did cause evacuation. Sussman,<sup>23</sup> in a study of human subjects who were free from any evidence of cholecystic disease, determined that in fasting persons or those on a carbohydrate diet the gallbladder did not empty for at least five days and might remain filled for a much longer time. He attributed the gradual decrease in shadow density to the absorption of the dye by the gallbladder wall. He concluded that gallbladder evacuation depends on cholecystokinin, which in turn depends on the introduction of fats or acids into the duodenum in fairly high concentrations. Three egg yolks emptied the normal gallbladder within thirty minutes. Robinson<sup>11</sup> reported improvement in his cholecystographic studies when the dye was preceded by a meal containing a glass of whole

milk or a cup of cocoa well buttered toast and two soft boiled eggs. Kirklin<sup>24</sup> however, after extensive experience was firm in the belief that eggs, cream or other fats given before the ingestion of the dye interfere with the examination. He has repeatedly insisted that, if the technic is proper, every gallbladder which does not fill can be said with assurance to indicate pathologic changes in the biliary tract.

**Nonvisualization**—Most of the reports that have appeared in the literature have indicated that 8 per cent or more of the nonvisualized gallbladders have later proved to be free from pathologic changes. Ferguson and Palmer<sup>12</sup> concluded after a large series of routine examinations, that the diagnosis of cholelithic disease on the basis of a normal cholecystogram alone was entirely unwarranted. In a case of nonvisualization after intravenous administration of the dye Whitaker<sup>8</sup> found after cholecystectomy, the gallbladder filled with a thick concentrated bile. Microscopic examination showed no pathologic changes in the gallbladder wall. Stewart and Illick<sup>25</sup> thought that some of the failures to fill might be due to a temporary edema of the cystic duct. Jenkinson<sup>26</sup> recommended that all patients with nonvisualization be reexamined after a month during which time a diet rich in fats should be given.

#### PRESENT STUDY

No one has yet made a correlation of the reported observations with the roentgen examination of a large number of patients, which I now propose to do.

These studies were undertaken under conditions found in many x-ray laboratories and following accepted roentgenographic procedures.

**Object**—The object of this study is as follows:

- 1 To determine the percentage of presumably normal gallbladders that do not fill on first examination.
- 2 To repeat some of the studies previously made on the effect of food on the already filled gallbladder.
- 3 By attention to the preexamination diet, to determine the effect of a high fat diet on filling the presumably normal gallbladder.
- 4 If it is possible to suggest a routine that will offer better results in the examination of the gallbladder that is normal.

**Procedure**—That the results might be comparable with those of other workers, the general laboratory routine was followed that obtains in many x-ray laboratories. Three preparations of soluble iodophthalein purchased on the open market, were used. Doses of the three products were 3.5 Gm, 3.6 Gm and 4 Gm respectively.

The following written instructions were given each student, who was urged to follow these to the minutest detail or forego the examination entirely:

- 1 At 6 p. m. eat supper (specific instructions for supper were given to each group, as will be noted).
- 2 Immediately after supper empty entire contents of bottle in a glass and add water (about 1 ounce [30 cc]) slowly, stirring until a thick smooth paste is formed. Then add 4 ounces of water (120 cc), stir well and drink the entire amount.
- 3 Lie down and keep quiet for at least one hour after taking the dye.

4 Eat nothing after taking the dye, eat no breakfast, although water, black coffee or clear tea may be drunk.

5 Report at the laboratory fourteen hours after taking the dye.

Cathartics are not usually given, but many roentgenologists direct that an enema be taken on the morning that the roentgen examination is to be made. I gave neither cathartics nor enemas. While the technical results of the roentgenograms would undoubtedly have been better had the colon been flushed out, it was deemed best to do nothing that might interfere with the gallbladder being full at the time of examination.

**Observations**—The following 512 observations were made on 182 medical students. The ages ranged from 18 to 30 years and the weight from 90 to 190 pounds (41 to 86 Kg). Every student, as far as it was possible to determine, was free from any illness and especially from any sign or symptom of gastrointestinal, hepatic or biliary tract disease. The results are shown in the accompanying table.

Group 1 One hundred and three students who had not been previously examined were given the preexam-

Tabulation of Results of Study of Gallbladders

| Group | Diet                      | Number Examined | Number Filled | Number Not Filled |            | Percentage |

† For three days before examination.

‡ For three days after gallbladder already filled.

ination diet with no alteration except for the evening meal preceding the ingestion of the dye. For this they were instructed to eat the usual amount of supper but no eggs, cream butter or other fats.

Group 2 Fifty-two students from group 1 who had a positive gallbladder shadow were given a fat meal of cream and eggs and reexamined for effect on evacuation.

Group 3 Fifty students were instructed to eat for a period of three days preceding the examination a large amount of fats fat meats cheese cream, butter and eggs. A similar supper was to be eaten before the ingestion of the dye.

Group 4 Fifty students were given the following instruction. For three days and for the evening meal before taking the dye exclude from the diet all fats already listed and all fried foods.

Group 5 Twenty-five students were given an exclusive fruit diet for three days, including the evening meal before taking the dye.

Group 6 Twenty-five students from groups 3 and 4 who had normal cholecystographic shadows, were given an exclusive fruit diet for three days and then, without receiving additional dye were reexamined.

Group 7 Fifty students, most of whom had been previously examined but who had been on their regular diet for at least one month, were directed to take a fat free evening meal, as in group 1. The following

morning they were allowed a breakfast which consisted of toast or sweet rolls without butter but with jam or jelly, cereal with skimmed milk and sugar but without butter or cream and tea or coffee with sugar but with no cream. They then reported for roentgen examination.

Group 8 Fifty students under the same conditions as those in the preceding group were instructed to eat a meal rich in fats, as in group 3, and on the following morning a breakfast as in group 7, before reporting for examination.

Group 9 Thirty-seven students from groups 7 and 8, who showed a normal gallbladder filling after the breakfast given were allowed to eat a lunch of their own choosing. They were then reexamined five hours after lunch or shortly before the next evening meal.

Group 10 Seventy students, of whom 20 were on a minimal fat and 50 were on a high fat diet, were given the dye paste, to which was added 4 ounces of grape juice instead of water. The ingestion of this mixture was preceded by the administration of 1 drachm of paregoric.

#### COMMENT

When Graham and Cole first announced the use of a dye that would, when injected into the blood stream, be eliminated into the biliary passages and would render the bile in the gallbladder opaque to roentgen rays virtually nothing, based on present day knowledge, was known about the gallbladder. That the gallbladder was a reservoir for bile was believed, and the importance of bile in fat digestion was generally accepted. By what mechanism the gallbladder was emptied was not known. Roentgenologists were debating the probable influence of a filled stomach, pressure of the duodenal cap, contraction of abdominal musculature or the general increase in intraabdominal pressure as the factors which brought this about. Some leading physiologists<sup>27</sup> doubted that the gallbladder could, by contraction of its musculature, evacuate itself. It remained for Ivy to demonstrate the exact mechanism of gallbladder emptying and for Boyden and others to point out the influence of foods other than fats on the activity of this organ.

Knowledge of the physiologic nature of the gallbladder has changed greatly since that early work, but the technic first used in cholecystography is still followed by many roentgenologists. The role played by fat has been accepted, but that a definite relationship may exist between the preexamination dietary habits of the patient and a normal cholecystogram seems to have not occurred to many. That the gallbladder filled with concentrated not easily evacuated bile because of prolonged carbohydrate or low fat diet rather than actual pathologic changes could be responsible for the nonvisualization seems to have not been considered a possibility. That there is a very definite relationship between the preexamination dietary habits of the patient and the results of the cholecystographic study has been demonstrated, I believe, by the present study.

The observations in group 2 reconfirm the role played by fats in producing evacuation of the already filled gallbladder. Groups 6, 7, 8 and 9 demonstrate that a carbohydrate or low fat diet, under the same conditions met with in a medical practice, will not empty the already filled gallbladder.

Groups 4 and 5 demonstrate the fact that in many patients on a low fat or carbohydrate diet the gallbladder will not admit opaque bile in quantities sufficient to cast a shadow. While occasionally calculi are demonstrated in patients free from any evidence of cholecystic disease, it is not common in this age group. It is fair to assume, therefore, that the nonvisualization in these cases was due not to pathologic changes in the gallbladder but to the fact that the gallbladder was already filled with bile.

By the same reasoning it may be assumed that this factor was responsible for nonvisualization in 28 per cent of the cases in group 1. From this group one may also conclude that many patients in the economic class from which medical students are drawn get an inadequate amount of fat in their regular diet.

An analysis of the studies of group 3 clearly indicates that fat feeding before the introduction of the dye not only does not interfere with but actually aids filling of the gallbladder. That 100 per cent filling after the fat feeding was not obtained is not an indictment of the procedure. It rather indicates that the amount of fat was inadequate or that the feeding was not carried out over a sufficient length of time. It may also indicate that factors other than diet also interfere with the filling of the normal gallbladder. This has been suggested by other workers. It is a point which needs further study.

I feel, however, that sufficient evidence has accumulated to warrant the suggestion that a high fat diet is indicated for a period of several days before cholecystic examination. It is obvious that this dietary regimen should be under the control of the referring or family physician. It has been suggested that when calculi are present such a procedure might precipitate a "gallbladder colic." I have been able to find no proof of this assertion. Fat feeding, however, might be withheld in those cases in which calculi are known to be present or in which the history, clinical and laboratory findings definitely point to cholecystic disease and roentgenograms are desired only for confirmation.

That nausea, emesis and diarrhea do not interfere with gallbladder filling is indicated by the findings in group 10. The percentage of filling in this group was not appreciably different than that in the other groups which were on the same diet. This would indicate that the amount of dye was sufficient and the retention long enough to permit adequate absorption. The addition of grape juice and the use of paregoric, however, rendered the entire procedure very much less disagreeable for the patient.

#### CONCLUSIONS

From the work of others here reported and from the observations made in the present study I feel justified in making the following conclusions:

1. Fat is an essential factor in the gallbladder emptying mechanism.

2. Patients on a fat free or low fat diet may have a gallbladder which, not emptied for days, may be distended with thick concentrated bile, and such a gallbladder, unable to admit more bile, will not be visualized on roentgen examination.

3. All patients whose gallbladder is examined routinely or who have a questionable or doubtful cholecystic history should be put on a high fat diet for several days or even weeks before the roentgen examination.

PNEUMONOCONIOSIS ENCOUNTERED  
IN BITUMINOUS COAL MINERS

R HAROLD JONES, MD

FAIRMONT, W VA

For many years silicosis has been accepted as a definite clinical entity occurring in workers exposed to siliceous dust in various mining occupations. Anthracosis in employees of anthracite mines has long been recognized, but one is surprised at the paucity of mention in medical literature of nodular or fibrotic pulmonary changes in bituminous coal miners.

It is a well known fact that dusts, both organic and inorganic, are present in variable concentrations in the mining and preparation of bituminous coal. Gardner<sup>1</sup> in 1938, in the evaluation of irritating effects of various minerals on the tissue of experimental animals, demonstrated that bituminous coal dust was irritating as well as anthracite dust. Cummins and Shadden<sup>2</sup> in 1930 concluded that anthracosis was not a simple condition, as thought by many, but was a form of pulmonary fibrosis, usually due to an associated silicosis. Clark and Moffett<sup>3</sup> in a recent study of 774 miners employed by a bituminous coal company in the southern Appalachian region, found that 2 per cent of the workers had presilicotic changes and 1 per cent showed silicotic nodulation. The Division of Industrial Hygiene of the United States Public Health Service, collaborating with the Utah State Board of Health,<sup>4</sup> published in 1940 a report based on the study of three bituminous coal mines in Utah. In this study there were adequate engineering as well as medical criteria. The authors pointed out that practically all of the suspended dust particles in the atmosphere of these mines were capable of entry into the lungs and that the dust concentrations in most of the underground occupations were great enough to constitute a dust hazard. In this series 507 workers were examined, and 32 per cent were found to have anthracosis after all persons having had other exposure were excluded.

Several years ago my colleagues and I became impressed with the number of soft coal miners presenting themselves at our institution, located in the bituminous coal field of southern West Virginia, with either a major or a minor symptom of chronic cough or dyspnea, usually referred to by the patient as "miners' asthma." This stimulated our interest and led to our obtaining a more careful history, especially with regard to the industrial aspect. A careful fluoroscopic and roentgenographic study of the chest and routine sputum and blood analyses were made on the patients with the aforementioned symptoms and those having long employment in the bituminous coal mines. During the four year period 86 cases of silicosis were discovered in which silicotic changes were present in varying degrees. In this series were included only those cases in which exposure to dust had been in bituminous coal mines alone. Several cases showing silicotic changes were excluded since the

men had previously worked in dissimilar types of industry having a dust hazard. Other cases in which the condition was predominantly infectious, with only a minimal evidence of silicosis, were not included in this series. In correlating the industrial histories one is impressed by the fact that coal miners have a tendency to migrate from mine to mine. In a period of several years they will have worked for various companies and in several capacities, each job probably having quite a different degree of dust concentration. This variation in employment makes it difficult to classify each miner so as to make an accurate statistical study. For the sake of simplicity, I have made an effort to place each miner in some group depending on his history with regard to dust exposure together with the length of employment in each occupation.

Each respective case in this series has been classified under stage 1, 2 or 3 silicosis. Those cases showing only a fine nodular or grainy appearance diffuse hazy-

Fig 1—Age groups with number of cases in each group stage of involvement and disability incidence

ness or a ground glass appearance, with no, or only partial, obliteration of the linear markings, were classified under stage 1. The nodules in this group usually measured less than 1 mm in diameter, and there was a varying degree of hilar proliferation and broadening.

Those cases in which more nodulation was demonstrated the nodules exceeding 1 mm in diameter, with associated emphysema (the latter usually being present at the apexes and bases), were placed under stage 2. A large number of the patients in this group presented themselves with varying degrees of pulmonary symptoms.

In stage 3 the symptoms were pronounced. Emphysema was demonstrated at the bases of the lungs, and often in the apexes. These changes were observed on physical examination as well as on roentgenographic study. A large portion of the nodules had become coalescent, giving a conglomerate appearance, and the hilar were indistinct. The persons in this group were disabled for the performance of manual labor. There was associated superimposed infection, in some tuberculous. A few cases showed cavitation obviously associated with

From the Medical Service, Laird Memorial Hospital.

Dr Lewis E. Nolan performed the necropsies and studied the histologic sections and Dr Ernst Wolff assisted in the preparation of the roentgenograms.

acid fast organisms and in others probably the result of silicotic necrosis

In arriving at a conclusion in each individual case other pulmonary lesions were ruled out. The conditions considered in differentiation were military, chronic, nodular and fibroid tuberculosis, primary or metastatic carcinoma, sarcoidosis and residual changes as the result of arteriosclerosis.

Fig. 2 (case 1)—Anthracosilicosis stage 1. Note uniform haziness with fine filament of fibrosis and small delicate generalized nodules.

A large number of patients were hospitalized for diagnostic observation.

In the accompanying chart and table some of the important features of this group of cases are analyzed. Figure 1 graphically presents 86 cases of anthracosilicosis divided according to the age decade, with the number of cases of each stage of the lesion in each decade. The total number of persons disabled in each group is included. The first group numbered 5 patients, and the youngest patient was 26 years old.

The oldest patient in whom anthracosilicosis was found was 79. The average age of the 86 patients was 50.75 years. It is interesting to note that the extreme age groups (the 5 included in the decade ending at 29 years and the 70+ year group) showed fewer patients than the others and that none of the patients were disabled. There was a larger number in the 60 to 69 year group, which totaled 17 patients. None of these patients were classified under grade 3, although 1 was considered disabled. All the patients with stage 3 involvement, it is

\* Case 6 was included in this group the patient having been employed nine years as a driller.

shown, were found in the middle aged group (30 to 59 years) and the largest total number was represented here. Thirteen patients, or 15 per cent of the total series of 86, were classified as being disabled. This group represents the more active span of the individual worker's productive life. In this graphic representation no attempt has been made to subject the series of cases to a further statistical analysis, as this is not an industrial group study and any further analysis might lead to erroneous deductions.

In the table the series is analyzed as to years of exposure, chief mining occupation and stage of involvement. This study demonstrates that in terms of disability the total period of employment in the mining industry is not of paramount significance. All of the stage 3 group is composed of those persons who had less than thirty years' employment. The average period of employment in bituminous coal mining for all patients studied was twenty-eight years.

It is worthy of note that in the group of 7 miners with not more than nine years of exposure 3 were classified as having stage 2 or stage 3 involvement. These 3 men were all employed as machine men, motormen or drillers, which leaves the impression that persons working in these three occupations are subjected to higher dust concentrations than men in other types of employment. The same impression is noted in studying the group who had had ten to fourteen years' exposure. Those patients with longer periods of employment were mainly loaders and, as a group, showed a lesser degree of involvement in spite of many more years of working in bituminous coal mining.

The following cases taken from this series will illustrate the various histories, clinical and laboratory findings, roentgenographic changes and, in some cases pathologic features. Two cases with autopsy are presented.

REPORT OF CASES

CASE 1—I W P, a white man aged 71, complained of slight chronic cough with exertional dyspnea. The presenting symptoms were not featured. He had been a coal loader in West Virginia coal mines for sixty-one years and showed no unusual chest signs on physical examination. There was mild generalized arteriosclerosis. Studies of the blood gave normal results including the sedimentation rate. The sputum was negative for acid fast organisms. The lungs showed uniform haziness with a fine filament of fibrosis, and small, delicate nodules were scattered throughout. The apexes appeared clear. The diagnosis was anthracosilicosis stage 1 (fig. 2).

CASE 2—I S, a Negro aged 29, complained of moderate dyspnea. He had been a driller in the mines for one year, a motor brakeman for two years and a coal loader for eight years. His serologic reactions were positive, the sputum was negative for acid fast organisms. There was slight increase in the sedimentation rate, otherwise the hematologic survey revealed nothing abnormal. He was afebrile during the several days of observation.

A roentgenogram showed small foci of nodular areas of increased density, with hazy margins scattered throughout all lobes. The hila were broadened, and strands of increased density were seen extending into both apexes, more prominent on the left. The condition in this case was differentiated from military tuberculosis by the clinical course. Repeated over a period of several months, during which time the patient was under antisyphilitic therapy, showed no changes.

Fig. 3 (case 2)—Anthracosilicosis stage 2, with probable infection. Note small nodular areas of increased density with hazy margins scattered throughout all lobes with hilar broadening. Serial studies showed no change.

roentgenographic or on clinical study. The diagnosis was anthracosilicosis stage 2 probably with infection (fig 3).

CASE 3—I R, a white man aged 52 complained of bilateral pleuritic pain the pain being of two days' duration on first examination. He gave a history of moderate dyspnea, with a hacking, nonproductive cough of several years' duration, without hemoptysis or constitutional symptoms. His employment record showed twenty-eight years in soft coal mines as

motor brakeman, driller and foreman for the last eleven years he had been employed as a safety inspector. Throughout the period of hospitalization the temperature was not elevated, although there was a moderate amount of tachycardia on exertion. The chest was poorly developed and of the rachitic type. A pleuritic dry friction rub was heard at the bases of both lungs, with coarse musical rales throughout, and very distant breath sounds in the midportion of the lung fields; the chest expansion was 2 inches

Fig 4 (case 3)—Anthracosilicosis stage 3. Note multiple small nodular areas of increased density throughout all lobes with confluent areas in the right upper and the base of the left upper lobe. No change was evident on serial examination.

(5 cm). The hematologic survey revealed nothing abnormal except slight increase in the sedimentation rate. A series of sputum examinations showed no acid fast organisms. A roentgenogram revealed multiple small nodular areas of increased density throughout both lungs extending into the apices, with confluent increased density in the right upper lobe and a smaller area at the base of the left upper lobe. Repeated studies over a three year period showed no change in the roentgenographic picture. The diagnosis was anthracosilicosis stage 3 (fig 4).

CASE 4—L S P, a white man aged 53, complained of dyspnea, persistent cough and progressive weakness of five years duration. The patient had become symptom free when at rest. The cough had been productive for one year without hemoptysis, and there had been a 40 pound (18 Kg) loss of weight during the five years. He had been employed in bituminous coal mines for twenty-two years—thirteen as shot boss, the remainder as loader and shooter. The patient was afebrile during hospitalization although there was slight tachycardia at all times and the respiratory rate was moderately elevated even at rest. Coarse rales were heard in the midportion of the lung fields posteriorly. There was rather decided tachycardia on holding the breath. Moderate increase was shown in the sedimentation rate. Otherwise the results of the hematologic survey were not abnormal. Examination of the sputum was negative for acid fast rods. Roentgenographic study showed hazy dense mottling between the first and sixth ribs anteriorly with diffuse nodulation and conglomeration in this area. Hilar shadows were diminished and nodulations hazy. Pleurodiaphragmatic adhesions were present. The apexes and bases were relatively clear. The diagnosis was anthracosilicosis stage 3 (fig 5).

In the following 2 cases pulmonary changes were demonstrated post mortem in persons from two separate occupational groups. The first was a coal loader over a period of fifty years, the second, a driller for nine years.

CASE 5—The body was that of a 66 year old white man who had been employed in bituminous coal mines for fifty years as a coal loader. The cause of death was acute perito-

nitis, secondary to acute suppurative gangrenous appendicitis with perforation. When the thorax was opened the hilar lymph nodes were seen to be slightly enlarged and were black on sectioning. The pleural cavities were free of fluid and adhesions. The left lung weighed 665 Gm, the right, 680 Gm. Externally and internally the pulmonary surfaces were coal black. All the lobes contained small firm, nodular areas, 4 to 8 cm in diameter, extending from the hilus to the periphery. There were an increase of fibrous connective tissue and emphysematous bullae along the lateral margins of the lower lobes and in the apical areas of the upper lobes. The pericardium and the heart were grossly normal. Microscopic study (with hematoxylin and eosin and Masson's technique) demonstrated numerous fibrous nodular areas about the blood vessels and lymphatics, made up of fibrous connective tissue and collagen with an extensive deposit of blackish pigment in the areas. The capillaries were compressed at the margin of the nodules. Infiltration of occasional polymorphonuclear and mononuclear cells was observed. Large numbers of emphysematous alveolar spaces were present. Some of the alveoli contained macrophages, and the walls of the bronchi were thickened, with increase of fibrous connective tissue. The lumen contained polymorphonuclear and red blood cells. Chemical analysis revealed a total silicon dioxide content of 0.36 per cent of dried lung.

CASE 6—O T, a 48 year old white man, had been a farmer until nine years before his death. During the last nine years he had been employed in bituminous coal mines as a driller.

When the thorax was opened it was observed that the lungs were rigid and filled the chest cavity. The walls of the bronchi were thickened, and the hilar lymph nodes were enlarged, measuring from 2 to 3 cm in length and were firm and gray. The left lung weighed 1,440 Gm and the right 1,480 Gm. Crepitation was noticeably diminished in both lungs. They contained firm, nodular areas and were fairly rigid. The left upper lobe was bound to the chest wall by dense fibrous adhesions. The lungs cut with greatly increased resistance, disclosing numerous whitish gray and a few yellow gray, rounded nodular areas of fibrosis, 3 mm to 2.4 cm in diameter. The larger nodules were situated in the peripheral portion of the lobes. There were macroscopic areas of emphysema between nodular areas of fibrosis throughout all lobes. Many of the fibrous areas were confluent. The pericardium was normal. The heart weighed 430 Gm and was grossly normal.

Microscopic examination of the numerous sections from various representative areas of lung tissue disclosed massive rounded areas of dense fibrous connective tissue and collagen which had extensively destroyed the lungs. The nodules were made up of irregular whorls of dense fibrous connective tissue interspersed with collagen, and many of them had hyaline areas. Some nodules were small

measuring approximately 500 microns in diameter, while others were coalescent and made up of masses of fibrous tissue measuring from 1 to 2.5 cm in diameter. The pulmonary alveoli at the margins of the fibrous nodules presented large saccular spaces. The emphysematous areas formed an extensive part of the histologic picture between nodular areas of fibrosis. The nodules were

Fig 5 (case 4)—Anthracosilicosis stage 3. Note hazy dense mottling between the first and sixth ribs with diffuse nodulation and conglomeration in this area. Hilar shadows were diminished and nodulations hazy. Diaphragmatic adhesions were present.

relatively acellular, and in many the nuclei had entirely disappeared. There were scattered lymphocytes and polymorphonuclear neutrophilic leukocytes at the margin of the nodules. In the dense fibrous areas the capillaries were compressed and for the most part obliterated. In the emphysematous areas the capillaries were dilated and filled with erythrocytes. Some of the alveoli were filled with small polyblasts, plasma cells, lymphocytes and polymorphonuclear neutrophilic leuko-

Fig. 6 (case 5)—Anthracosilicosis. Note fibrous nodular areas about the blood vessels and lymphatics, containing collagen and an extensive deposit of blackish pigment. There are areas of emphysema adjacent to the nodules. Reduced from a photomicrograph with a magnification of 100 diameters.

cytes. The interalveolar septums contained lymphocytes, polymorphonuclear neutrophilic leukocytes and a few macrophages. In some alveolar areas were seen large mononuclear cells with brownish coarse pigment in the cytoplasm. In the emphysematous areas many of the small blood vessels were surrounded by circular areas of fibrosis. These areas contained many fibroblasts, a few lymphocytes and polymorphonuclear neutrophilic leukocytes, large mononuclear neutrophilic leukocytes, a small amount of serum and desquamated epithelial cells. In the fibrotic areas occasional small irregular particles of blackish pigment were observed. In some of the lymph nodes were irregular areas of fibrosis with extensive hyaline formation. Other nodes contained caseous tubercles, made up largely of epithelial cells with marginal lymphocytes. The mesenteric lymph nodes embodied extensive areas of caseation surrounded by fibrous capsules infiltrated with lymphocytes. In the spleen were numerous miliary tubercles made up largely of epithelial cells. The liver contained numerous miliary tubercles made up of epithelioid cells, Langhans giant cells and peripheral lymphocytes. There was beginning necrosis at the center of many of the tubercles. Study of the adrenal glands revealed numerous small tubercles with central necrotic areas surrounded by epithelioid cells, giant cells with peripheral nuclei and a marginal zone of lymphocytes.

The cause of death was pulmonary silicosis, the associated cause, chronic pulmonary tuberculosis, with miliary dissemination. Chemical analysis disclosed a silicon dioxide content of 3.05 per cent of dried lung.

## COMMENT

I do not feel that an accurate statistical study of this group of cases can be made, as many were referred for compensation or medicolegal opinion. In this study of 86 cases I have attempted to show that silicosis in soft coal miners is not a rare disease and that "miners' asthma" and anthracosilicosis are one and the same. The entity can be detected by means of a searching clinical study of persons employed as underground workers in the mining and preparation of bituminous coal. It has been demonstrated that the greater number of cases occur in the decades from 40 to 60 years of age and that the majority of the persons disabled by anthracosilicosis are in this span. However, 4 men in the next younger decade (30 to 39 years) were disabled. All of those in the disabled group had spent a large part of their mining life as drillers, motor runners, coal shooters or machine men. These occupations appear to be the most hazardous in the way of exposure to siliceous dust, to the extent of causing disability.

One concludes that disability is not necessarily in proportion to the total number of years employed in the mining industry but depends more on the occupation. However, a lesser but definite degree of anthracosilicosis does occur, although not to a disabling extent, in

Fig. 7 (case 6)—Extensive severe pulmonary silicosis. Observe an irregular area of dense fibrous connective tissue and collagen arranged in irregular whorls interspersed with collagen. There are empty, irregular alveolar spaces at the margin. Some of these contain serum and neutrophils. Note dilated capillaries filled with erythrocytes at the margin and compressed capillaries with the fibrous nodule. Reduced from a photomicrograph with a magnification of 100 diameters.

loaders and other underground workers after long years of employment.

Postmortem studies show that pneumoconiosis in soft coal miners may be of two types. 1. The well known deeply pigmented lung may show rather definite changes of associated silicosis as the result of long year

of exposure to bituminous coal dust containing silica.<sup>2</sup> There may be advanced conglomerate pulmonary silicosis with a minimum of anthracotic pigment.

Unfortunately little work has been done on group surveys of underground workers in the bituminous coal industry. Before a definite impression can be had as to the real incidence of silicosis and anthracosilicosis in these workers systematic studies of large groups in the soft coal fields will have to be carried out. At the same time, information regarding dust hazards as determined by thorough engineering surveys is almost completely lacking. Before worthwhile statistics become available showing the actual incidence and degree of silicosis and the hazards due to bituminous coal dust containing silica in the bituminous coal industry, thorough industrial engineering and medical surveys in the various fields must be made and the results of the two correlated.

#### CONCLUSIONS

Anthracosilicosis should be suspected in all soft coal miners with cough and dyspnea, usually referred to as 'miners' asthma.'

The cases in the series have been classified as those of stage 1, 2 or 3 involvement, in 13 cases the men were disabled.

Disability is not necessarily in proportion to the number of years of employment in the mines but depends more on the occupation.

Further group medical studies and engineering surveys should be made in the bituminous coal industry, with correlation of the findings.

### THE TREATMENT OF TYPHOID AND DYSENTERY CARRIERS WITH SUCCINYLSULFATHIAZOLE

WILLIAM M. M. KIRBY, M.D.

AND

LOWELL A. RANTZ, M.D.

SAN FRANCISCO

The discovery that certain derivatives of sulfanilamide are relatively poorly absorbed from the gastrointestinal tract marked the beginning of a new era in intestinal antiseptics. One of these compounds, sulfaguanidine, has been given extensive clinical trial and has been found to be of value in the treatment of patients with acute bacillary dysentery<sup>1</sup> and of dysentery carriers.<sup>2</sup> In cases of typhoid<sup>3</sup> the typhoid carrier state<sup>4</sup> and ulcerative colitis<sup>5</sup> the results have been discouraging. Patients undergoing extensive operations on the bowel were also given this drug with the hope that reduction of the number of gram-negative bacilli in the intestinal contents might cause a decrease in the incidence of infections of the peritoneal cavity due to fecal contamination. It was not entirely satisfactory for this purpose partly because it was absorbed into the blood stream to such an extent that it gave rise to frequent and occasionally

severe reactions and partly because it was ineffectual in the presence of ulcerating lesions of the bowel.<sup>5</sup>

In an attempt to overcome these objections, Poth and his associates<sup>6</sup> investigated a number of sulfonamide compounds and found some that were poorly absorbed from the gastrointestinal tract and that possessed bacteriostatic activity even when the primary amino group on the benzene ring of sulfanilamide or one of its derivatives had been conjugated with dibasic organic acids to form substituted acid amides. The most promising of these substances was succinylsulfathiazole, the formula for which is

Since the bacteriostatic action of the sulfonamides is known to be dependent on the presence of the free amino group on the benzene ring the mode of action of this compound needs to be explained. It has practically no *in vitro* activity. Although it was postulated that the presence of the free carboxyl group might somehow 'give a high local concentration of a reactive excited form of nascent sulfathiazole in intimate contact with the organism,' Poth showed that the drug is hydrolyzed in the intestinal tract giving a concentration of free sulfathiazole of from 50 to 200 mg per hundred cubic centimeters. Such concentrations are known to have strong bacteriostatic and bactericidal activity,<sup>7</sup> and until concrete evidence of the production of 'nascent sulfathiazole' is forthcoming it can be concluded that the action of succinylsulfathiazole is entirely dependent on the liberation of free sulfathiazole and that the addition of the succinyl radical to the sulfathiazole molecule merely inhibits absorption from the gastrointestinal tract.

When administered to patients the drug produced 'a profound change in the physical characteristics and the bacterial flora of the feces.'<sup>8</sup> The stools became small in bulk, semisolid and relatively odorless, and the number of coliform bacilli was drastically reduced. Absorption from the gastrointestinal tract was slight, with only 5 per cent being excreted by the kidneys. Severe toxic reactions were not noted, and there was a general impression that administration of the drug to surgical patients was associated with a 'smooth, uncomplicated postoperative convalescence.'

Reports of treatment of nonsurgical conditions with succinylsulfathiazole have not yet appeared. Our purpose in this communication is to present the results of administration of this drug to normal persons and to typhoid and dysentery carriers and to compare these results with those following administration of sulfaguanidine which were previously reported from this clinic.<sup>9</sup>

## TYPHOID

Succinylsulfathiazole,<sup>10</sup> 0.25 Gm per kilogram, was administered to 11 persons, 3 without evidence of disease, 3 typhoid carriers and 5 dysentery carriers, all of whom remained ambulatory throughout the course of treatment. The daily dose was divided into four por-

tionary output of total sulfathiazole was determined on one or more occasions. All sulfonamide determinations were made according to the method of Bratton and Marshall.<sup>11</sup>

## RESULTS

**Effect on Stools**—The effect of the drug on the stools varied considerably in different persons. In 6 instances they became slightly loose, lighter in color and smaller in bulk and had practically no odor. In the others the changes were much less noticeable, in 1 or 2 remaining entirely normal and in the others showing slight to moderate alterations of the same character as those just described.

The effect on the colon bacilli also showed individual variations. The results in the 9 cases in which daily quantitative counts were made are shown graphically in chart 1. In 6 the coliform organisms disappeared from the stools completely, and while they were definitely reduced in the other 3 considerable numbers were still present. In every case the number of colon bacilli returned to normal within three to five days after administration of the drug had been discontinued.

Although the gram-negative organisms were absent in some instances, the stools were not sterile. Gram positive organisms, especially enterococci, were present in large numbers, as demonstrated by cultures on blood agar plates.

**Absorption and Excretion**—The blood levels for free sulfathiazole were consistently low, varying from 0.6 to

Chart 1—The effect of succinylsulfathiazole on the colon bacilli in the stools of 9 persons. There was a sharp reduction in all instances, and in 6 the coliform organisms disappeared altogether. When the drug was discontinued the number of colonies of *Escherichia coli* returned to normal in from three to five days.

tions, which were taken at 8 a. m. and 1, 6 and 11 p. m., and the duration of administration of the drug varied from five to fourteen days.

The alteration of the bacterial flora of the intestinal contents was studied by daily quantitative counts of the number of colon bacilli in freshly voided stools. All counts were made on pour plates with MacConkey's medium to which 5 mg per hundred cubic centimeters of para-aminobenzoic acid had been added to inhibit the action of the sulfonamide drug. A small quantity of feces was suspended in a few cubic centimeters of isotonic solution of sodium chloride, centrifuged at 1,700 revolutions per minute for fifteen minutes, and dilutions were made on the basis of the quantity of sediment, 0.1 cc of sediment being considered equivalent to 0.1 Gm of wet feces. Counts were made for at least two days before the drug was administered, and in 9 of the 11 cases were continued until the number of coliform organisms had returned to normal. Quantitative counts were also made of the typhoid and dysentery colonies, which could be easily distinguished from the coliform colonies on the MacConkey pour plates.

The odor and character of the feces were noted, and to establish the time of appearance and disappearance of the drug in the stools qualitative tests were made daily for the presence of the sulfonamide drug. The amount of free sulfathiazole in the blood was determined on the third or fourth day, and in 5 cases the twenty-four hour

Chart 2—Effect of succinylsulfathiazole on coliform and dysentery bacilli in the stools of a dysentery carrier. The number of colonies of *Escherichia coli* returned to normal four days after the drug had been discontinued, while dysentery bacilli have remained at an elevated level for a follow-up period of sixty days. Similar results were obtained in 4 other dysentery carriers.

1 mg per hundred cubic centimeters, indicating that the drug is only slightly absorbed from the gastrointestinal tract. Total sulfathiazole levels for twenty-four hour urine specimens varied from 20 to 62 mg per liter.

11 Bratton, A. C., and Marshall E. K., Jr. *J. Biol. Chem.* 125, 1939.

10 Sharp & Dohme, Inc., supplied the succinylsulfathiazole used in this study.

cubic centimeters, which was from 22 to 41 per cent of the total drug (as succinylsulfathiazole) ingested in twenty-four hours.

The time of appearance of the drug in the stools, as measured by the qualitative presence of free sulfathiazole, varied from one to three days, and three to five days was required for all traces to disappear after treatment was discontinued.

**Dysentery Carriers**—Dysentery bacilli disappeared from the stools of all 5 patients within one week after treatment was begun and have remained absent during the follow-up period of thirty to sixty days (chart 2). In 3 of these the colon bacilli also disappeared completely, so that for three or four days there was no growth on the plates at all. The possibility that insufficient para-aminobenzoic acid was present in the medium to inhibit the action of the drug was excluded by streaking the plates with a suspension of normal stool, and good growth invariably occurred. In the other 2 patients the number of colon bacilli was sharply reduced but they did not disappear altogether.

**Typhoid Carriers**—The 3 typhoid carriers, all middle aged women who refused to have their gallbladders removed, had been previously treated unsuccessfully with sulfaguanidine.<sup>4</sup> With succinylsulfathiazole the results were equally unsatisfactory. Although somewhat decreased, large numbers of typhoid bacilli were constantly present in the stools throughout the two weeks of drug administration.

**Toxic Reactions**—Almost all the patients reported that the drug acted as a mild laxative. Their stools were loose, and they had three or four movements a day, but none had actual diarrhea. Four complained of mild perianal irritation that lasted three or four days and then disappeared in most instances before they stopped taking the drug. Otherwise toxic reactions were not noted. There was no nausea, vomiting, dizziness, headache, fever, cutaneous rashes, hematuria or anemia. The patients remained ambulatory, and all were able to continue their daily routine. Two of the typhoid carriers who suffered from severe nausea, vomiting and headache while taking sulfaguanidine did not experience any discomfort whatever during succinylsulfathiazole administration.

#### COMMENT

The original observations of Poth and his associates concerning the effects of succinylsulfathiazole administration on the intestinal contents have been confirmed in the present study. The stools become lighter in color and are relatively small in bulk, the odor is diminished and the number of colon bacilli is sharply reduced. The drug is only slightly absorbed from the gastrointestinal tract, producing blood levels of free sulfathiazole of less than 1 mg per hundred cubic centimeters, and less than 5 per cent is excreted in the urine.

Since the succinyl radical is attached to the amino group on the benzene ring, the drug has no *in vitro* activity, and its effectiveness *in vivo* is presumably due entirely to hydrolysis in the gastrointestinal tract with the liberation of free sulfathiazole. Poth has shown that concentrations of free sulfathiazole ranging from 50 to 200 mg per hundred cubic centimeters are found in freshly voided stools, indicating that variability exists. The extent to which hydrolysis occurs in different persons probably accounts for the fact that there is

more noticeable alteration in the physical characteristics and bacterial flora in some than in others. In conditions which tend to inhibit hydrolysis, therefore, the therapeutic efficacy of the drug can be expected to be diminished.

Daily quantitative stool counts revealed that typhoid bacilli were somewhat decreased in numbers but were still present and viable when large amounts of the drug were present in the bowel, whereas dysentery organisms disappeared completely and have not returned during a follow-up period of from thirty to sixty days. This suggests that mere seeding from the gallbladder was not responsible for failure to cure the typhoid carriers, and one can have no assurance that more favorable results would occur with intensive drug therapy following cholecystectomy.

Judging from these results, succinylsulfathiazole and sulfaguanidine appear to be equally effective in the treatment of dysentery carriers and equally ineffective in the treatment of typhoid carriers. However, the number of patients is small, and differences may become evident when more patients are studied. In cases of acute bacillary dysentery, hydrolysis of succinylsulfathiazole may be sufficiently impaired by diarrhea to render this drug less effective than sulfaguanidine. Favorable results have been reported in the treatment of acute bacillary dysentery, however, with ordinary sulfathiazole, in spite of the fact that this drug is largely absorbed from the gastrointestinal tract.<sup>12</sup> Whether the addition of the succinyl group, which inhibits absorption and permits smaller amounts of free sulfathiazole to be present throughout the entire bowel, will provide a more effective drug can be determined only by clinical trial. *In vitro* experiments indicate that sulfathiazole is a more powerful bacteriostatic and bactericidal agent than sulfaguanidine,<sup>13</sup> but so many variables exist that therapeutic efficacy cannot be accurately predicted on the basis of these results.

Succinylsulfathiazole has one outstanding advantage, namely that it is absorbed into the blood stream to a much smaller extent than sulfaguanidine and therefore is much less likely to cause reactions. No severe reactions have occurred with succinylsulfathiazole, either in the cases studied by Poth and his associates or in those reported here. This is further illustrated by the fact that 2 of the typhoid carriers who suffered from severe nausea, vomiting and headache while taking sulfaguanidine, experienced no discomfort whatever during succinylsulfathiazole administration. The only symptoms associated with the ingestion of succinylsulfathiazole were a tendency to pass frequent, loose stools and to have slight perianal irritation, complaints too minor to inconvenience significantly any of the patients.

#### SUMMARY AND CONCLUSIONS

1. Succinylsulfathiazole has been found to produce a decided alteration of the physical characteristics and bacterial flora of the stools. It is only slightly absorbed from the gastrointestinal tract, producing blood levels of free sulfathiazole of less than 1 mg per hundred cubic centimeters and an average of less than 5 per cent is excreted in the urine.

12. Cooper, M. L., Zucker, R. I., and Wagner, Stewart. Sulfathiazole for Acute Diarrhea and Dysentery of Infants and Children. *J. A. M. A.* 117: 1-20 (Nov. 1) 1941.

13. Straus, Elia, Dingle, J. H., and Fendley, Maxwell. Studies on the Mechanism of Sulfonamide Action: Inhibition and Penetration. *J. Immunol.* 42: 513 (Nov.) 1941.

2 The effectiveness of the drug is probably due entirely to hydrolysis in the gastrointestinal tract with the liberation of free sulfathiazole

3 Dysentery bacilli disappeared from the stools of 5 carriers during succinylsulfathiazole administration and have remained absent for periods varying from thirty to sixty days

4 Typhoid bacilli remained viable in the stools of 3 carriers during two weeks of drug therapy

5 The only reactions noted were a tendency to pass frequent, loose stools and to have slight perianal irritation

6 Since it is only slightly absorbed into the blood stream, succinylsulfathiazole is much less likely to produce severe toxic reactions than sulfaguanidine

## SIGNIFICANCE OF NEUTRALIZING ANTIBODY IN EXPERIMENTAL EQUINE ENCEPHALOMYELITIS

A CONSIDERATION OF ITS RELATION TO THE DISEASE IN MAN PRELIMINARY REPORT

R. WALTER SCHLESINGER, M.D.

ISABEL M. MORGAN, Ph.D.

AND

PETER K. OLITSKY, M.D.

NEW YORK

Our purpose in this report is to direct attention to recent experimental studies which may be applicable to plans for vaccination of man against infection with equine encephalomyelitis virus. That there may be need for such vaccination in the face of an epidemic is indicated by recent events. 1 An apparent increase in the incidence of the human disease has occurred, in 1941 more than 3,000 clinically recognized cases due to the western virus were reported in the Northwestern states and in adjacent provinces of Canada.<sup>1</sup> 2 Western virus was isolated from mosquitoes,<sup>2</sup> from horses and from 1 prairie chicken<sup>3</sup> in endemic areas. 3 Since antibody to the same virus was found in a large variety of birds and mammals, they are suspected of being natural reservoirs of virus.<sup>4</sup> Thus the difficulty of eliminating all actual and potential sources of infection is indeed great.

The apparently good results obtained from vaccination of horses with formaldehyde inactivated chick embryo virus<sup>5</sup> have led to the suggestion of using

similar immunization in man. Beard and his associates<sup>6</sup> have reported that vaccination of several persons resulted in the presence of demonstrable neutralizing antibody in their serums. We were able to confirm these results by the use of formaldehyde inactivated allantoic fluid from infected chick embryos.<sup>7</sup> Direct evidence is still lacking, however, as to whether the presence of such antibody will protect a vaccinated person against natural infection.

### ANTIBODY TITER AS AN INDICATOR OF THE EFFICACY OF VACCINATION IN THE EXPERIMENTAL ANIMAL

The effect of specific immunization may be determined in two ways: the test dose for resistance is given either by a peripheral route, simulating the assumed natural mode of infection (mosquito bite), or by injection of virus directly into the central nervous system—the most stringent method. It has been found<sup>8</sup> that vaccination of susceptible young mice, when it induces neutralizing antibody, invariably renders them resistant to peripheral injection of active virus. The mere presence of such antibody, however, while ensuring peripheral resistance, does not necessarily signify resistance to intracerebral inoculation. Such resistance is not encountered unless the antibody has reached a certain level—a level determined by titration of antibody by means of serum dilution.<sup>9</sup> This critical level has recently been defined on the basis of experiments in rabbits,<sup>10</sup> as follows:

We found that a vaccinated rabbit which had demonstrable antibody in its cerebrospinal fluid resisted intracerebral inoculation of a lethal dose of virus. The spinal fluid had the same neutralizing capacity as a three hundred fold dilution of serum. Conversely, if this antibody titer of the serum was not reached, antibody could not be detected in the spinal fluid, and the animal, as a rule, failed to resist the intracerebral test dose. The ratio agreed with what Freund<sup>11</sup> had previously established in rabbits immunized with typhoid vaccine: a constant ratio exists between the agglutinin titer of the spinal fluid and that of the serum. The ratio averages 1:300 and is of the same order of magnitude as that of blood free brain tissue to serum. Freund stressed the point that this ratio parallels that of normal globulins in the spinal fluid to those in the serum.

These results led to the suggestion that at the defined level antibody becomes available in sufficient concentration to arrest the spread of virus in the central nervous system. Thus the requirement for an effective vaccination is determined largely by the route by which the test dose or the natural infecting dose will enter the host.

An attempt was made to appraise the significance of neutralizing antibody in experimental infection of a type that, we assume, follows more closely than any other the natural infection.

# CORRELATION BETWEEN DEGREE OF IMMUNE RESPONSE AND OUTCOME OF INFECTION AFTER PERIPHERAL INOCULATION IN NONVACCINATED EXPERI- MENTAL ANIMALS

The susceptibility of mice to equine encephalomyelitis virus injected peripherally decreases with increasing age.<sup>12</sup> Morgan<sup>13</sup> was able to show that this change in susceptibility parallels an increase in capacity for a rapid immune response. The difference between young and old exists despite the fact that the two are found to be almost equally susceptible to the virus given intracerebrally. More recently the course of the infection following subcutaneous injection of western virus has been studied in rabbits. Adult rabbits showed no clinical signs of infection. Certain ones, however, had a characteristic febrile reaction which resembled that seen in monkeys,<sup>13</sup> horses<sup>14</sup> and guinea pigs<sup>15</sup> after similar inoculation, in such rabbits virus could be demonstrated in the circulating blood for one to three days after injection. In some instances the blood stream infection concurred with an early, moderate rise in temperature. High fever occurred only after virus had disappeared from the circulation and had been replaced by demonstrable neutralizing antibody. In spite of the presence of such antibody in the serum, virus could be demonstrated in the brains of rabbits killed at the time when the fever reached its highest peak. On the other hand, defervescence occurred characteristically in those animals which were not killed, in most cases it set in five to six days after injection and coincided with a rise in serum antibody titer to 1:300. Several young, i.e. 4 weeks old, rabbits died of typical encephalitis following subcutaneous inoculation of western virus. Typical signs or death occurred before antibody could be detected in their serums at a 1:300 dilution, as shown in the chart.

These observations were interpreted as indicating that the inapparent infection of the central nervous system in the adult rabbit had been arrested when neutralizing antibody had reached, at the critical time, the level at which it became available to the central nervous system.

## THE HUMAN INFECTION IN THE LIGHT OF EXPERIMENTAL DATA

In man as in horses,<sup>14</sup> monkeys, guinea pigs<sup>13</sup> and rabbits after peripheral injection, the course of an infection with equine encephalomyelitis virus ranges from that of mild abortive infection to severe encephalitis, leading to death or recovery, sometimes with sequelae. Inapparent infections occur which are recognized only because they lead to the presence of neutralizing antibody.<sup>16</sup> With the exception of the epidemic reported

by Hammon,<sup>17</sup> all outbreaks have been characterized by a relatively high incidence of frank cases among infants and children.<sup>18</sup>

If the human infection follows the pattern of infection in the experimental animal after peripheral inoculation, the presence of antibody is preceded by the transitory circulation of virus in the blood. Such circulation may or may not lead to an invasion of the central nervous system. If it does, the outcome of the disease may depend, as it does in the rabbit, at least in part on the degree of immune response of which the individual is capable. Howitt<sup>19</sup> recently found antibody to western virus in the spinal fluid not only of monkeys surviving experimental infection but also of 17 out of 20 human convalescents whose serums neutralized the virus. Her results fortify us in the view that recovery from an infection of the central nervous system with the equine virus is correlated with the availability of neutralizing antibody to the central nervous system and

Subcutaneous injection of western equine encephalomyelitis virus in rabbits R 190 effect on adult rabbit. To be noted are the febrile reaction, the time of circulating virus and the relation of antibody titer to defervescence. R 189 is similar to R 190 except that this adult rabbit was killed and the presence of virus in the brain in relation to the other factors is represented. R 277 effect on a young rabbit. Fatal encephalitis. Failure to reach antibody titer of 1:300 at time of death.

that its demonstration in the spinal fluid is an indication of this availability.

The evidence at present indicates that the mode of infection of man is by the mosquito bite and thus may be analogous to "peripheral" inoculation in the experimental animal. We would therefore postulate that circulating antibody such as has been induced in man by vaccination<sup>20</sup> would neutralize the virus in the general circulation before it could reach the central nervous system as it does in the vaccinated animal.<sup>6</sup> These considerations and the fact that the results of

vaccination of horses are good, lead us to believe that vaccination of human beings is justified in the face of an epidemic

SUMMARY

1 Specific immunization of rabbits protects against an intracerebral test inoculation of equine encephalomyelitis virus only when the antibody in the serum reaches a titer of 1:300 or higher. At this level antibody becomes demonstrable in the cerebrospinal fluid, and this is believed to be an indicator of its availability to the central nervous system. It had already been shown that a low titer of serum antibody in vaccinated young mice was sufficient to indicate resistance to peripheral inoculation of this virus.

2 Subcutaneous injection of active western virus in adult rabbits may lead to clinically inapparent virus invasion of the central nervous system, characterized by high fever and preceded by the presence of virus in the blood. Such infection of the nervous system takes place at a time when antibody is being produced. Defervescence and recovery set in as the antibody titer of serum reaches 1:300 (at about five to six days after injection).

3 Young (4 weeks old) rabbits, similarly injected, die of encephalitis before this antibody level has been reached.

4 Infection of man with equine encephalomyelitis virus and its possible prevention by vaccination are discussed in the light of experimental findings.

PNEUMONIA IN A RURAL PRACTICE

ITS INCIDENCE AND MORTALITY

EDWIN J. SIMONS, M.D.  
SWANVILLE, MINN.

This paper has as its object the portrayal of the care of pneumonia patients and the results of such care by the general practitioner or family doctor in an average rural American community. The community involved is a town of 435 population in a strictly agricultural district. It is felt that such practices typify customary rural treatment of pneumonia and its results under the American system of medicine. Contrast of this work with similar studies conducted in urban and teaching centers provides a yardstick by which to measure the average medical care in rural United States.

On Jan. 1, 1937 the Minnesota Department of Health started typing sputum for pneumococci without cost to the patient or attending physician. When requested, type specific serum was provided at cost, or without cost if the patient was unable to pay.

As will be recalled, this was before the use of the sulfonamides. Type specific serum had been used extensively in many of the large urban centers. An increasing number of reports from these cities showed reduction in the mortality rate of pneumonia by the use of type specific serum.

These developments suggested several interesting problems regarding pneumonia in a rural practice. One question involved incidence. Influenza, or "flu," often was diagnosed when influenza had not occurred in other districts. Further than that, one reputable physician had so few influenza cases and so many pneu-

monia cases that he engendered the ridicule of his confrères. The question then was "Might not many of the so-called influenza cases be pneumonia, or might not the incidence of pneumonia in rural areas be higher than is commonly believed?"

And the second question involved the mortality of pneumonia in rural practice. While many of the reports

TABLE 1—Incidence of Types of Pneumococci

| Type                             | No. of Cases |
|----------------------------------|--------------|
| I                                | 21           |

| XXIX, XXXIII                     | 1 each       |
| Total of types                   | 115          |

of the mortality of pneumonia in teaching and urban centers were available, no work had been done by which a comparison could be made of the rural and urban pneumonia mortality.

With these ideas in mind, on Oct. 1, 1937 a routine procedure of handling all suspected cases of pneumonia seen in rural practice was planned. Cases were considered as suggestive of pneumonia when the symptoms included chills, fever, cough, purulent or blood stained sputum, pain in the chest, vomiting or prostration. The finding of rales, bronchial or bronchovesicular breathing and evidence of consolidation on percussion or palpation were sufficient to classify the case as one suggestive of pneumonia. When either the symptoms or the physical signs aroused suspicion, a specimen of sputum was sent by bus or train to the Minnesota Department of Health. If the sputum examination revealed a definite type of pneumococci, serum was administered within twenty-four hours of the time the patient was first seen. Later, when the sulfonamides could be had, chemotherapy was started immediately after the sputum specimen had been secured. This delay was solely to avoid interference with typing.

TABLE 2—Age Incidence of Pneumonia in Present Series

| Age      | Cases | Per Cent |
|----------|-------|----------|
| 0 to 4   | 33    | 28.7     |

INCIDENCE

Following these criteria for sputum typing, during four and one-half years, from Oct. 1, 1937 to April 1, 1942, 117 proved cases of pneumococcal pneumonia were encountered. The frequency of types as determined by the Minnesota Department of Health is given in table 1.

This tabulation shows that only 115 of the 117 cases were actually typed. One of the remaining 2 cases

Clinical collaboration was given by Dr. P. A. Swedenburg and Dr. W. M. Schulze, and statistical assistance by Dr. W. R. Murlin.

was proved by x-ray examination and the other by consultation. The last mentioned case was one of the earliest of the series in which death was an important factor in initiating this study.

Age analysis showed ages ranging from 4 weeks to 83 years. There were 70 males and 47 females, a ratio of 60 to 40, or 3 males to every 2 females. Table 2, on age incidence, reveals a higher incidence of pneumonia in the age group 0 to 4 years than is customarily seen.

As can be seen in chart 1, the age incidence in pneumonia cases conforms in a general way with the incidence of pneumonia deaths in Minnesota as plotted by the Minnesota Department of Health for one year 1940.

Seasonal incidence as shown in table 3 and chart 2, conforms in general with statistics of deaths from pneumonia for the state of Minnesota during the year 1940 and also with other series.

Of even greater interest, however, are some of the clinical facts revealed. Only 19 of the 117 patients were hospitalized. X-ray films confirmed the diagnosis in 18 cases, the other hospitalized case presenting a postpneumonic empyema. White blood cell counts were performed for as many cases as possible, but records of these were not kept. Complications occurred in

TABLE 3—Seasonal Incidence of Pneumonia in Present Series

| Month     | No. of Cases |
|-----------|--------------|
| January   | 7            |
| February  | 16           |
| March     | 21           |
| April     | 11           |

| December  | 20           |
| Total     | 117          |

39 cases. Of these, cardiac disturbances varying from auricular fibrillation to coronary occlusion and decompensation were the most frequent. Empyema, asthma, bronchiectasis and effusion occurred in 1 or more instances. Otitis media was not infrequent in the younger patients. Nephritis, kidney hemorrhage and prostatic obstruction occurred. In 1 case, chronic alcoholism was present.

The history or symptomatology was suggestive of pneumonia and consequently was considered positive in 100 per cent of the cases. Contrasted with this, physical findings were typical or positive in only 96, or 83 per cent of the cases. This fact is unquestionably related to the high incidence of childhood cases. Of the 117 patients 28 per cent were under 5 years of age and 14 per cent additional occurred up to 10 years of age, or a total of 42 per cent of the patients were children under 10 years old. But also it is confirmatory of Reimann's concept as expressed in his book, 'The Pneumoniae,' which states "I believe that a person with or without a mild upper respiratory tract infection who has a chill, fever of over 102 F, cough, pleuritic pain, tachypnea and blood tinged sputum has a pneumonia."

The present study then involved 117 cases of pneumonia proved by bacterial typing during a four and

one-half year period after Oct 1, 1937. To compare this incidence with an analogous period in the same practice, records were reviewed for four and one-half years prior to that time. During the first four and one-half year period, only 80 cases of pneumonia were encountered. Approximately 50 per cent more cases of

Chart 1—Age distribution of pneumonia cases in Swanville and pneumonia deaths in Minnesota

pneumonia were seen in the same practice in a like period of time when it was possible to prove the bacterial etiology of the pathologic process. Of significance also seems the frequency of such diagnoses as "flu" bronchitis and upper respiratory infection in the earlier period as compared with their infrequency in the present study period.

Consequently, from the foregoing analysis the statement seems justified that the incidence of pneumonia in rural practice is higher than its diagnosis in the past has indicated. In spite of the frequent absence of typical or pathognomonic physical findings of pneumonia, many cases diagnosed as influenza or bronchitis with proper bacterial study and typing should be classified as pneumococcal pneumonia.

Chart 2—Seasonal distribution of pneumonia cases in Swanville and pneumonia deaths in Minnesota

#### MORTALITY RATE

During the early part of the study, serum was given as quickly as it was received, the dosage varying with age, length of illness, type, complications and severity. Only 19 patients received serum alone and of these 1 died, a mortality of 5.3 per cent.

When the sulfonamides became available, 26 patients had both serum and chemotherapy. Twenty-five were given serum and sulfapyridine, and 1 patient had serum and sulfathiazole. Both drugs were administered in the doses customarily recommended in the literature except that the first dose was 1 Gm. rather than the 2 to 4 Gm. often advised. In rural practice it is not possible to determine blood levels, the determination of adequacy, inadequacy or overdosage depending on clinical manifestations. Blood levels of the drugs were determined in some of the hospitalized cases. In this group of 26 cases, no deaths occurred.

Reports in the literature during the course of the study indicated that the lowest mortality rate was often obtained by chemotherapy alone. Consequently, subsequent to this time 46 cases were treated with either sulfapyridine or sulfathiazole alone. In 36 cases sulfapyridine was administered and in 10 sulfathiazole. Both were administered as described in the preceding paragraph. In all instances chemotherapy was started as soon as sputum was obtained for typing. No deaths occurred in this group of 46 cases.

TABLE 4—Pneumonia Cases During Nine Year Period

|                                | Time                    |                        | Total and Average |

| Cases                          | 80                      | 26                     | 106               |
| Percentage of mortality        | 16.25                   | 15.4                   | 15.82             |
| Total percentage of mortality  | 16.25                   | 4.27                   | 9.15              |

Throughout the study period, 26 patients were encountered who could be or were given, for various reasons, neither serum nor sulfonamides. Of the 26 4 died, a mortality of 15.4 per cent.

Thus, then, with five deaths in a group of 117 cases the mortality for the series is 4.27 per cent. For comparison with the mortality rate prior to the advent of serum and chemotherapy, all the records of four and one-half years before Oct. 1, 1937 were reviewed. Table 4 presents these data.

It is seen from these figures that the total nine year mortality in 197 cases is 9.15 per cent. However, during the first half of this time when no specific therapy was available the mortality was 16.25 per cent, whereas in the last half, when serum and chemotherapy were used, it was only 4.27 per cent. Furthermore, it is significant that all 13 of the deaths in the first group of 80 cases and 4 of the 5 deaths in the last series of 117 cases occurred among patients who had neither serum nor chemotherapy. In this total group of 106 cases the mortality rate was 16.04 per cent. This fact accentuates the efficacy of serum and chemotherapy, especially when it is noted that 5.3 per cent mortality occurred in the serum treated cases and no deaths occurred in the chemotherapy group or in the combined serum and

chemotherapy group. It is recognized that the series is far too small to permit irrefutable deductions to be made.

Some consideration should be given to the 5 fatal cases.

CASE 1—C. F., a man aged 60, had had a mild coronary occlusion two years prior to his death. Throughout his illness he was attended by a chiropractor. Medical attendance was confined to two country house calls on the fourth day of illness and the day before his death. It was not possible to obtain sputum for typing. Chemotherapy was not available at this time.

This case was one of the principal factors in the inauguration of this study.

CASE 2—Mrs. E. N., aged 83, died of type III pneumococcus pneumonia in spite of serum administration. She had a severe serum reaction, 40,000 units was used, her heart began to fibrillate, she died on the fourth day of illness.

CASE 3—Mrs. J. B. S., aged 68, was sick four days before being seen by a physician. Impassable snow drifts made calling or attendance earlier impossible. She had a type I pneumococcus pneumonia. Chemotherapy was not available. She died within twenty-four hours of the time she was first seen and before serum could be administered.

All these patients had lobar consolidations, as determined by physical examination.

CASE 4—C. H., a man aged 81, had been confined to bed for a month as a result of decompensation due to an arterio-sclerosis-hypertension syndrome. He developed a severe respiratory infection, was found to have bronchopneumonic, patchy consolidation, and sputum typing revealed type XI pneumococci. He lived 14 miles in the country and died before either serotherapy or chemotherapy could be started.

CASE 5—O. G., a man aged 58, had been confined to bed for four months before the onset of pneumonia, suffering from repeated and severe episodes of coronary occlusion. His heart was decompensated at the time of his death, and a week prior to death pulsus alternans was observed on several occasions. Physical examination failed to disclose lobar consolidation, yet evidences of patchy, diffuse consolidations were found. Typing of sputum revealed type XVII pneumococci. Neither chemotherapy nor serotherapy was used.

Both of the last 2 cases, it is felt, should best be attributed to a terminal sequence of bronchopneumonia induced by the cardiac condition. Nevertheless they were both known to be pneumococcal pneumonia and for that reason are included in the present study.

COMPARISON WITH OTHER STUDIES

For comparison, nineteen series involving 32,352 cases in urban and teaching centers have been collected from the literature. They are shown in table 5.

It is notable that in this compilation the mortality of 9.86 per cent in 17,186 cases for which chemotherapy alone was used is lower than that of any other group. This fact is borne out also in the Swanville series. In this tabulation, mortality in the serotherapy group, 15.48 per cent, is lower than that of the groups in which both serotherapy and chemotherapy were used. The truth of this fact is supported by many individual series and compilations of many series. Another characteristic finding is a mortality of 31 per cent among 1,311 cases in which no specific therapy was administered. In this regard, Flippin, Reinhold and Schwartz<sup>1</sup> in

<sup>1</sup> Flippin, H. F., Reinhold, J. G., and Schwartz, L. S. "Sulfathiazole Therapy in Pneumococcal Pneumonia." J. A. M. A. 116: 683-689 (Feb. 22) 1941.

stated that the mortality of 12 per cent (corrected to 7.4 per cent) in the group of 100 sulfathiazole patients and of 15 per cent (corrected to 11.4 per cent) in the comparable sulfapyridine series compares favorably with the previous mortality rate of approximately 35 per cent at the Philadelphia General Hospital in the years preceding use of these chemotherapeutic agents.

Comparison of the total mortality in the urban and rural series shows a mortality in the former of 11.85 per cent and in the latter of 9.15 per cent. In the urban series are included cases of Stahle,<sup>2</sup> Price and Myers,<sup>3</sup> Finland, Lowell and Strauss,<sup>4</sup> Evans and Gaisford,<sup>5</sup> Schwartz, Flippin and Turnbull,<sup>6</sup> and Finland, Spring and Lowell,<sup>7</sup> in which specific therapy was not administered. In all there were 1,310 such cases, with a mortality of 31 per cent. When these cases are deducted from the total and the mortality is corrected accordingly,

tion of 26 cases with four deaths in which no specific therapy was used would reduce the total mortality in the rural series to 11 per cent, it is felt that conditions peculiar to rural practice make inclusion of this group necessary for proper comparison of urban and rural practices.

#### SUMMARY

Only 80 cases of pneumonia were found in rural practice in four and one-half years prior to pneumococcus typing of all suspected cases of pneumonia. Following establishment of a routine for the diagnosis of pneumonia which included typing, 117 cases of pneumonia were seen in the same rural practice during a similar period of four and one-half years. This represents an increase of incidence of 46 per cent.

Results of the use of serum and chemotherapy are reflected in a reduction of mortality from 16.25 per cent

| Totals and averages   |                    | 32302           | 1120  | 10.48          | 17186        | 9.86           | 2364                   | 18.64          | 1310                     | 31.0           | 11.85                |

the total mortality rate is found to be 8.9 per cent. Similarly in the rural series, when the 80 cases seen in the first four and one-half years, when no specific therapy was available, are deducted from the total, a mortality of 4.27 per cent is found. While it is true that a similar treatment of the two series suggests that deduc-

tion of 26 cases with four deaths in which no specific therapy was used would reduce the total mortality in the rural series to 11 per cent, it is felt that conditions peculiar to rural practice make inclusion of this group necessary for proper comparison of urban and rural practices.

Comparison of urban and rural mortality in pneumonia shows a mortality of 11.85 per cent in 32,352 urban cases and a mortality of 9.15 per cent in 197 rural cases. These rates, corrected by the deduction of 1,310 cases with 31 per cent mortality from the urban series and 80 cases with 13 deaths from the rural series are found to be 8.9 per cent and 4.27 per cent respectively.

#### CONCLUSIONS

1 Based on the present study the statement seems justified that the incidence of pneumonia in the average rural American practice when all suspected pneumonia cases are subjected to a diagnostic routine which includes bacterial study and typing of sputum specimens, is higher than is commonly supposed.

2 From the present study it appears that the mortality of pneumonia in the average rural American community compares favorably with that of urban and teaching centers.

V KORENCHEVSKY

LONDON

Professor Sherman<sup>1</sup> has pointed out that by the time a professional man has finished his schooling about one third of his life has passed; another third will be spent in proving to himself and others what he is able to do, and in most cases not until about the age of 50 does he attain or is he promoted to a post of high responsibility and given the fullest opportunities to do his work.

This statement is in general true also for civil servants and men in the armed forces and in industry.

Therefore the physiology and pathology of aging comes a war problem, and for medicine it is especially important to decide whether there are available or there

1. be found any practical means of helping the older man to keep fit both physically and mentally and so to perform his work in the best possible way. As will be discussed in more detail in a later paragraph, the problem cannot be solved by transferring responsible posts to young men who are neither experienced nor sufficiently tested, nor from the point of view of modern science and medicine is there any necessity to do this.

Aging of functions starts in human beings at the latest at the age of 30, of some functions even earlier. This statement is particularly well supported by the numerous and convincing observations of Koga and Morant<sup>2</sup>, Ruger and Stoessiger<sup>3</sup> and Elderton, Moul and Page<sup>4</sup> in the Galton Laboratory for National Eugenics and by Professor Miles and his co-workers<sup>5</sup> in the departments of psychology of Stanford and Yale universities. In the Galton Laboratory about 7,000 men and 1,850 women and in Miles' Laboratories about 820 persons were tested at different ages. Ergographic examination of muscular activity and psychologic tests of sensory and mental faculties were performed on these persons, and the results obtained at different ages were statistically examined and tabulated.

There is no room here for a discussion of the differences and variations observed among the effects of aging on the different functions. As a general conclusion on the basis of the results obtained it is possible to state that for most of the functions examined a decrement set in at least at the age of 30 and in the case of some of the faculties examined at the age of 20 or even earlier. For example, careful investigation of bone sensibility to vibration by Pearson<sup>6</sup> and also by Egger<sup>7</sup>

and Piercey<sup>8</sup> has established that this sensibility is greatest in children and in adolescents. The maximum acuity of audible pitch probably occurs at the age of 5 to 13 (Koga and Morant,<sup>2</sup> Ruger and Stoessiger,<sup>3</sup> Elderton, Moul and Page,<sup>4</sup> Ciocco<sup>9</sup>). The range of accommodation in the eye is greatest at birth, after which it proceeds to decrease with remarkable uniformity as age progresses (Friedenwald<sup>10</sup>). According to Bernstein,<sup>11</sup> the measure of accommodative power of the eyes might serve well as an index of the degree of senescence of the individual from his earliest years.

Minot<sup>12</sup> on the basis of cytomorphosis, Robertson and his co-workers<sup>13</sup> drawing their conclusions from the decline in the nucleocytoplasmic ratio (estimated chemically) in organs and tissues during aging and I<sup>14</sup> in an analysis of the data establishing the decrease from infancy of relative weights of vital organs with aging all considered that the aging process of "wear and tear" of organs and tissues starts in all probability in early infancy (I have previously published details of this theory<sup>14</sup>). However, the conclusion that the prime of life is early infancy needs further investigation from different angles. Especially it needs to be adjusted to the results obtained with psychologic and ergographic technique (the prime of life occurs in adolescent or early adult life) and to the observations (submitted later) of Lehman,<sup>15</sup> who came to the conclusion that the greatest mental productivity was on the average recorded at the age of 30.

Thus if a logical conclusion is based only on the average age at which the definite beginning of aging of most functions is observed, all responsible key posts should be given to persons at the age of 25 to 30.

CONSIDERABLE DECLINE OF MOST FUNCTIONS  
(ON THE AVERAGE) AT THE AGE OF  
SIXTY OR EVEN EARLIER

Although some excellent work has been done on aging, there is no doubt that further investigations are badly needed for confirmation and development of the results already obtained and for elucidation of several new points. From the data available, however, it is possible to suggest, as a general statement, that when human beings reach the age of 60 a considerable degree of decline occurs, as a rule, in most of their functions. For many functions (e.g. visual acuity, vibratory sensibility, even apparently some of the higher mental processes as measured by special tests) considerable decrement can be found earlier, more often at the age of 50.

One special change of mentality which may occur in older persons deserves great attention in connection with

Prof. R. A. Fisher gave the author helpful criticism and encouragement, and Mrs. B. Clapham did the statistical calculations and prepared the tables. For economy of space, the tables are not included in the paper.

any responsible activity in particular defense and war work. This change is best described and its important peculiarities best characterized by Professor Henderson and Dr Gillespie.<sup>16</sup>

Simple senile deterioration is the name given to the simpler form of senile change, and is within the limits of the normal. There is progressive narrowing of interest. The power of comprehension becomes less elastic and thought becomes sluggish. The individual sticks to an idea obstinately, and dislikes departure from the beaten track of his daily routine (the "misonicism" characteristic of the aged). When anything new is suggested he resents it with the protest that the old ways are best. Failure of memory is a very prominent feature. The situation varies with the individual case. There are those who despite the passage of years retain their physical vigor and mental faculties to a surprising degree, while others, at a much younger age become old both in body and mind.

Professor Saundby<sup>17</sup> has written on this point (pp 63-64)

While the intelligence of the aged is often conserved the senses suffer. New ideas are accepted with difficulty and often with dislike, intellectual effort if long continued, becomes painful and the power of sustained attention becomes weakened. It becomes increasingly difficult for them to make up their minds to any new course of conduct [pp 37]. Imagination also is weakened invention fails, the emotions are subdued the brain reacts less promptly to the external stimuli and assimilates new ideas less readily.

Sir Farquhar Buzzard<sup>18</sup> comes to a similar conclusion.

If a man's neural sensitivity is the index of his age its decline [in old age] is expressed by his difficulty in retaining fresh impressions his reluctance to forming new associations, and his inadequacy to unaccustomed impulses.

Cannon and Tranchell-Hayes<sup>19</sup> emphasize (p 269)

The earliest symptoms of senility is an inability to find any good in the present state of affairs and a tendency to glorify the past. Increasing conservatism and obstinacy are noted.

The same point is emphasized by Professor Hollingsworth<sup>20</sup> (p 315)

Old age is thus conservative, reactionary, and resistant to the newer ways of the younger generation. In so far as he [old man] is still in power, he tends to foist upon the changing generation the older standards of conduct, the old ideas and institutions.

Lhermitte and Nicolas<sup>21</sup> come to similar conclusions and stress especially the weakening of creative imagination in senescence.

#### EARLY OR VERY LATE AGE AT WHICH THE SYMPTOMS OF SENILITY MAY DEVELOP

With a summary of the data presented, it is possible to conclude that in terms of statistical averages there is no function so far investigated in which decrement does not appear with aging.

Allbutt<sup>22</sup> rightly said, however (p 117)

In medicine we do not count the ages of people by the revolutions of the earth round the sun, but we measure them by the revolution of their own morbid processes.

Sadler<sup>23</sup> emphasizes the same point (p 909)

It must be remembered however that age in the mental realms as in the physical organism, is not merely a matter of years. Some individuals are as old or older at 40 than others are at 60 or even 65.

Professor Tilney<sup>24</sup> is especially emphatic in his practical comments on the subject (pp 1142-1143)

In the matter of our mental attitude towards old age progress is also needed.

The later years of life should no longer be regarded as the time for retirement, as the days of patient waiting. Ripe in experience, rich in the gifts of wisdom, is it right for a man to retire simply because his years are many? Not if he has a brain which is healthy and firm and capable of serving his fellow-men.

Professor Lehman (1936)<sup>25</sup> has found that the majority of outstanding contributions by physicists, chemists and inventors were made at 30 to 34 years. On the other hand, he emphasizes that this average figure should under no condition imply that a man's best work could not be performed at an older age. Thus in a group of chemists 34 per cent made their first and only important contribution after the age of 40, 19 per cent after the age of 50, 5 per cent after the age of 55 and one chemist made his at the age of 69. Besides age, other factors may help to explain the decrease in the number of important contributions with aging, e.g. older scientists often perform their research work through their students and co-workers (p 158). The fruits of genius are a function of numerous integers, including the personal traits of the worker, external conditions and their fortunate combination.

In another investigation (1937) Lehman<sup>26</sup> arrives at a similar conclusion with regard to the age at which authors have most frequently published their best books (p 73). "Literary masterpieces of the first rank have been published most frequently by men who were not over 45 years of age."

Maximum productivity occurs at the age of 37 to 42, but it seems "highly probable that best books have been written most frequently by authors who were still in their thirties." As in the case of scientists "there are, of course, many exceptions to this latter statement, and there seems to be no fixed age limit beyond which outstanding literary work cannot be done" (e.g. the second part of "Faust" was published when Goethe was more than 80 years of age).

Rhein, Winkelman and Patten<sup>25</sup> put an anatomic foundation in this statement. They compared the clinical history of 100 senile patients with the pathologic-anatomic changes found in the brain after the death of these patients. They found in 11 of 100 patients only fibrotic degeneration of the brain vessels, without any pronounced changes in the brain. These patients lived to be very old, had no hemiplegias and conserved

and Hoff and Shaby<sup>44</sup> Neurosis, experimentally produced in sheep, was also considerably improved by administration of the adenal cortex extract (Liddell, Anderson, Kotyuka and Hartman<sup>45</sup>)

#### MALE GONADS

Here again there is a similarity between the effects of castration or hypogonadism and some features of senility. For instance, castration in man produces in most instances the following changes (a survey of the earlier literature is given by Romeis<sup>37</sup> and Falta<sup>46</sup>)

1 Obesity in some cases only (Tandler and Grosz,<sup>47</sup> Korenchevsky<sup>48</sup>)

2 Phlegmatic state of mind, apathy, depression (Miller, Hubert and Hamilton,<sup>49</sup> Reiss<sup>50</sup>)

3 Emotional instability (Miller, Hubert and Hamilton)

4 Unwillingness to do mental or physical work (Reiss)

Decrease in muscular activity (Simonson, Kearns and Zer,<sup>51</sup> Reiss)

6 Fatigability (Miller, Hubert and Hamilton, Reiss)

7 Sleeplessness (Reiss)

8 Hot flushes (Hamilton,<sup>52</sup> Miller, Hubert and Hamilton)

9 Increased tendency to giddiness and sea sickness (Reiss)

10 Atrophic sex organs

To these symptoms observed in man must be added certain changes which have been found in animals (probably also occurring in man) which are important from the point of view of functional activity of the organism, namely

11 Smaller liver, kidneys and heart (Korenchevsky,<sup>53</sup> Noble and Greenberg,<sup>54</sup> Mark and Biskind,<sup>55</sup> Crabtree<sup>56</sup>)

In the male climacteric (Mendel,<sup>57</sup> Hollander,<sup>58</sup> Marcuse,<sup>59</sup> Vaertig,<sup>60</sup> Venzmer,<sup>61</sup> Werner<sup>62</sup>) symptoms similar to those of castration appear at the average

age of 48 to 52 years, the earliest age at which they have been observed being 40 (Marcuse, Vaertig). As in the woman, the symptoms in the man may be classified as

1 Nervous and psychic, to which belong intense subjective nervousness, headaches, giddiness, scotomas, emotional instability with an inclination to tears, irritability, sudden changes of mood, decreased interest in the usual activities (even pleasures), a desire to be left alone, decrease or loss of memory and ability for mental concentration, mental fatigability, loss of or disturbed sleep, day sleeping. A typical "climacteric neurasthenia or involutional psychosis, chiefly in the form of melancholia, with a tendency to suicide might develop

2 Cardiovascular changes hot flushes, fits of perspiration, chilly sensations (e. g. cold feet), tachycardia, palpitation, numbness, tingling

3 General and other changes, including increase of body fat, physical fatigability, rougher and darker skin with wrinkles or folds appearing on the exposed parts, constipation, decreased sex potency and libido

The changes which follow gonadectomy and some, in many cases several, changes present in men suffering from the virile climacteric or senility (already described) can be improved or some even returned to normal with testosterone esters (Henssge,<sup>63</sup> Laroche, Marsan, Bompard and Corcos,<sup>64</sup> Venzmer,<sup>61</sup> Villaret, Justin-Besançon and Rubens-Duval,<sup>65</sup> Veil and Lippross,<sup>66</sup> Vest and Howard,<sup>67</sup> Laroche and Bompard,<sup>68</sup> Miller, Hubert and Hamilton,<sup>49</sup> Foss,<sup>69</sup> Werner,<sup>62</sup> Arndt<sup>70</sup>)

Of particular interest are the following observations

The psychotic conditions of some mental diseases which develop in the male climacteric or in old age can also be successfully treated, in some instances even with resultant complete and lasting cure, by testosterone esters (Schmitz,<sup>71</sup> Weiss,<sup>72</sup> Guirham,<sup>73</sup> Thomas and Hill<sup>74</sup>)

Simonson, Kearns and Enzer<sup>51</sup> found that testosterone esters injected or given by mouth increased the performance of muscular work by 41 to 69 per cent in eunuchoids or castrated men, while Villaret, Justin-Besançon and Rubens-Duval noticed in eunuchoids so treated a better development of muscles and larynx, a decrease of obesity and an increase of growth and body weight. Vest and Howard even observed disappearance of the wrinkled progeric condition of the skin

In old or prematurely senile men treated with androgens, ergographic tests carried out by Veil and Lippross<sup>76</sup> and by Hamilton and Gilbert<sup>75</sup> showed an increase of muscular strength (up to 44 per cent, Veil and Lippross) of expiration pressure of air and of pressure under which urine was excreted (Veil and Lippross). Laroche and Bonnard<sup>68</sup> also noticed better development of somatic muscles and increase of muscular strength and endurance.

It has been found by several workers (e.g. McGrath,<sup>76</sup> Ratschow and Klostermann,<sup>77</sup> Suzmann, Freed and Prag<sup>78</sup>) that ergotamine tartrate produces gangrene of the tip of the tail in rats, similar macroscopically and microscopically to angitis obliterans which develops in old people. This experimental gangrene in rats could be prevented by injections into females of estrogenic hormones and into males of testosterone esters. Suzmann and his associates found that even in castrated males estrogenic esters had a protective action.

In old people suffering from angitis obliterans, intermittent claudication gangrene of the foot, ulcus cruris, angina or pseudoringina pectoris and other angiospastic disturbances of a lighter nature (e.g. cold feet and hands, numbness of the extremities), treatment of men with androgens and women with estrogens brings about alleviation or even cure of the pathologic conditions (in cases of gangrene when the disease threatens or it is just beginning to develop, but of course not when it is well advanced). These observations have been made by Baeeke,<sup>79</sup> Sieard,<sup>80</sup> Champy<sup>81</sup> Schittenhelm,<sup>82</sup> Teitge<sup>83</sup> and Arndt.<sup>80</sup> Champy and Arndt found that this angiospastic effect of sex hormones is not sex specific, e.g. both male and female sex hormones were active in males.

In castrated animals, the liver, kidneys and heart, which have decreased in size, become hypertrophied after injections of androgens, as shown by investigation of weights of the organs, their histologic structure and experiments on the isolated hearts (my co-workers and I<sup>83</sup>). Hypertrophy of the kidneys and (by some authors) of the liver and the heart after treatment with androgens has also been investigated and confirmed by Selye,<sup>84</sup> Pfeiffer, Emmel and Gardner,<sup>85</sup> Ludden, Krueger and Wright,<sup>86</sup> Noble and Greenberg,<sup>84</sup> Kochakian<sup>87</sup>

and Crabtree.<sup>88</sup> In agreement with our experimental observations on the hypertrophying properties of male sex hormones on the heart are also the observations of Hamilton and Gilbert,<sup>75</sup> who found hypertrophy of the heart in human cryptorchids treated with testosterone esters. Probably a beneficial effect of the male sex hormones in senile cardiovascular cases, previously mentioned, may be explained partly in the same way. Venzmer (1938)<sup>61</sup> explains the effect of sex hormones by the suggestion that they probably have a dilatation effect on the arteries. Friedlander, Laskey and Gilbert<sup>88</sup> observed after ovariectomy a consistent reduction of blood volume of about 25 per cent, which could be returned to normal by treatment with estrogens. Reiss<sup>89</sup> found in rats that after administration of sex hormones the blood content of the brain was always increased. According to Henssge,<sup>63</sup> high blood pressure in old people was lowered after treatment with sex hormones, but Aynan<sup>89</sup> did not observe this in the case of estrogens.

With regard to the duration of the beneficial effects of sex hormones on any of the senile features described in this chapter, according to all the authors it varies (e.g. Venzmer,<sup>61</sup> 1937) in some cases it disappears a few days after the end of the treatment, while in many other cases the improvement or disappearance of the disturbances lasts some months, a year or even two or three years. The authors also state that there are cases in which hormone treatment causes no improvement.

In general, however, the favorable effect of the hormone has been claimed in most cases as striking. Therefore these claims by numerous investigators of the problem can under no circumstances be disregarded.

#### COMMENT

The similarity of certain features of deficiency of the thyroid, adrenal and sex glands with those of senility and the favorable effect of the hormones on these glands on several features of senility, which many investigators have claimed, strongly suggests the desirability of testing these compounds on elderly patients in hospitals, the best possible technic being used, with the aim of ascertaining definitely their properties as harmless and desirable physiologic stimulants in old age. In the case of the sex hormones special attention must be paid to finding compounds or doses which do not stimulate the sex libido or function an undesirable effect in old age.

The greatest defect of all the clinical trials so far performed appears to have been either the too small number of patients observed or the deficient technic, especially the inadequacy of the control experiment. In most of these trials, there was no control group of patients injected with oil only.

There is another group of natural stimulants—the vitamins—which also needs to be extensively investigated with the best and most comprehensive clinical technic.

If the trials could be organized simultaneously on a large number of patients in several hospitals (say seven to ten), at least some conclusions sufficient for the practical application of these stimulants might be expected in one or two years.

In the case of vitamins, especially, a decision to apply them practically might be reached without much reserve, if the doses that produce hypervitaminosis are clearly stated. If this precaution is taken only favorable results can be expected from their administration, especially when one takes into consideration the fact that war diets are not very rich in vitamins.

After two or three years of clinical trial it should also be possible to decide whether administration of androgens (preferably oral in the form of compounds or in doses which do not produce sex stimulation) could, always under medical supervision, be advised.

With regard to the practical application of thyroid and adrenal cortex preparations, because of their toxicity in certain doses, much more caution will be needed in coming to a decision, and it appears less certain whether a conclusive answer can be given after only one or two years of clinical trial.

#### SUMMARY

1 The process of aging of several functions and capacities, so far examined with the methods used, starts in the human organism at the age of 25 to 30, of some of them even much earlier (as also suggested by certain changes in the organs and tissues recorded by Minot, Robertson and myself).

2 From the practical point of view, this decrement with aging of some functions and capacities becomes considerable from the age of 50 and especially 60.

3 It must be emphasized, however, that the conditions of the functions and capacities in some young people can be as "old" as or "older" than their average condition at the age of 60 to 70, and, conversely, in some old people of 50 to 70 their condition can be equal to or better than the average of these features at the age of 20 to 25.

4 There are also important and irreplaceable advantages of old age wisdom<sup>90</sup> has been acquired and ability has been tested and proved.

5 There is sufficient evidence to indicate that (a) pathologic changes occur with aging in the sex, thyroid and adrenal glands, (b) a similarity exists between certain senile changes and some features of deficiency of these glands and also of vitamin deficiency. At the same time (c) successful treatment of some senile features with hormones and vitamins has been claimed, although it must be emphasized that apparently a deficient technic was used in many investigations.

6 All these data point to the urgent necessity for clinical research in order to elucidate the favorable effect of these compounds on old people.

7 If proved, the physiologic, natural, stimulating properties of these compounds might be especially helpful to old people in lessening the effect of great strain and in increasing the working capacity in periods of such great crises as war.

8 If clinical trials of the hormones and vitamins will be simultaneously organized and performed in several hospitals on a large number of senile patients there might be a reasonable hope of obtaining some practical results, especially with vitamins, even during the period of the present war.

9 This limited and practical aspect of the problem of aging is one of the war problems, and research on this subject is one of the urgent tasks connected with the war.

<sup>90</sup> Wisdom can be defined as natural intelligence of a high order, together with required manifold experience and knowledge and sagacious insight in deliberation and judgment.

## Clinical Notes, Suggestions and New Instruments

### TUBE FEEDING FATALITIES

BERNARD C. MEYER, M.D., NEW YORK

The all too frequent occurrence of death from faulty nasal tube feeding in hospitals for the mentally ill presents a serious problem. These accidents are usually caused by the pouring of food or water into the trachea, resulting either in sudden death or in a gangrenous pneumonia which is usually fatal. Occasionally death may be caused by trauma to the larynx.

Obviously such fatalities are reprehensible, nor can they be satisfactorily explained to the relatives of the victim, since they are usually the result of carelessness or of faulty technic. The ease of performing nasal gavage serves as a cloak to the real hazards of this procedure, which is potentially far more dangerous than the dramatic convulsion of shock therapy. Hence it is disturbing to find that in many institutions tube feeding is performed by nurses and attendants whose knowledge of the anatomy of the pharynx and larynx is often limited. Even when the tube is inserted by the physician, the remainder of the procedure, including the removal of the tube, is frequently relegated to some one else. The removal of the tube is likewise potentially dangerous, because there is always in the tube some residual food or water which can escape into the trachea as the tube is withdrawn, unless it has been pinched off properly. Occasionally the patient partially regurgitates the feeding or the tube and risky efforts are made to reinsert a tube partially filled with food.

Difficulties of any nature are more apt to arise in the feeding of an uncooperative, struggling or assaultive patient who twists the head from side to side, coughs voluntarily and may learn to regurgitate the food and tube at will. It is unwise to attempt to feed such a patient until he has received adequate sedation. It is much easier and safer to administer an intravenous barbiturate to such a patient than to attempt forceful tube feeding. A resistive patient may manage to prevent the descent of the tube, which curls up in the mouth, enabling the patient to seize it between his teeth. An efficacious method of dealing with this situation is to insert a second tube through the other nostril, which usually succeeds in causing the patient to release the grip on the first tube, while the second one has been passed into the stomach.

Nasal tubes are often kept cold in a container of ice. When the latter melts, water can enter the tube, and unless it is emptied the water may escape into the trachea in the course of passing the tube. In some hospitals, lubrication is effected with a light liquid petrolatum, a procedure which when constantly repeated may introduce significant quantities of oil into the pulmonary tree.

The following rules are suggested:

1 No one but a physician should be allowed to insert and remove the tube.

2 All water should be drained from the tube before insertion.

3 A jelly lubricant should be used in preference to liquid substances.

4 Before any material is introduced into the tube tube one or more of the following tests should be performed to determine whether or not the tube is in the trachea: (a) Place the inverted funnel in a bowl of water and look for bubbles. (b) Listen for air coming through the funnel. (c) Listen to the patient's normal speaking voice.

5 In case of coughing or regurgitation, the tube should be removed at once and the patient rolled on his side.

6 If the patient succeeds in regurgitating the tube, no attempt should be made to reinsert it. It should be removed and the procedure started over again.

7 In removing the tube one should do so after water has been poured through and after the residual water has been trapped in the tube by firmly pinching off the latter. The tube should be removed quickly.

8 In feeding a violent patient the use of force should be avoided and, if necessary, an intravenous sedative should be used.

## A SIMPLE SKELTONIZED PLASTER SPLINT FOR THE CERVICAL SPINE

SAM W. BANKS, M.D., EDWARD L. COMPERE, M.D.  
AND CHARLES WATSON, CHICAGO

Physiologic rest for the cervical spine is the treatment of choice for fracture, fracture dislocation, arthritis, radiculitis and other orthopedic or neurologic lesions involving the anatomic structures that lie between the base of the skull and the thorax. Continuous immobilization for a prolonged period of time, as following fracture or dislocation of a cervical vertebra, is accomplished with greatest efficiency by a neatly applied plaster cast. A more difficult problem in splinting is presented by those patients who require for use during the day a light and effective support which may be removed at night or for physical therapy procedures. If a particular type of cervical collar is to serve the greatest field of usefulness, it must be quickly available and the cost must be within the means of the average patient. Commercially prepared braces for the cervical spine are, for the most part, unsatisfactory in that they are bulky and expensive and rarely offer effective support.

Until recently we utilized a cervical collar made by the impregnation of crinoline bandage with plain celluloid dissolved

placed in front of the chin. All other strips are made by folding the splint lengthwise twice, so that each is three layers in thickness and one third the original width. A sufficient number of strips are folded so that the final thickness of each part of the collar will be made up of six such folded strips.

The patient is seated on a stool with an assistant holding the head in the desired position. A thin layer of petrolatum is smeared over the chin, neck and thorax to prevent the plaster from adhering to the skin and hairs. Two thicknesses of plaster for the chin support are first applied, one making sure that there are no wrinkles and that an adequate platform has been provided beneath the chin for support of the head. Two thicknesses of shoulder strips are then applied on each side and their front and back extremities are connected by cross pieces. The shoulder pieces must be placed sufficiently wide apart over the scapulae so that the collar can be readily removed over the head. Now the two oblique struts are placed on each side. The front struts extend from the top margin of the chin piece at the angles of the jaw to the anterior extremities of the shoulder strips. The posterior strips join the shoulder pieces just in front of the points at which they cross the clavicles. This pattern, while affording strength where there is stress and strain, permits ventilation on all sides, a fact

Fig. 1—Front view of cervical collar

Fig. 2—Back view. Note wide opening which permits removal of collar over the head

Fig. 3—Side view of collar showing chin support

in acetone. This necessitated the making of a plaster model of the patient on which the crinoline was gradually built up layer by layer until the desired thickness was obtained. Since ten to fourteen days were required to prepare the collar and the cost to the patient was \$35, its use was greatly restricted, particularly when immediate immobilization was desired.

Within the past eighteen months we have developed and used with complete satisfaction a light weight plaster splint made of Johnson & Johnson's ready prepared 5 inch wide specialists splints. The dried plaster is coated with a cellulose acetate mixture, which makes the collar a rigid support of minimum weight and waterproof. As the plaster is applied directly to the skin of the patient and is molded to the contour of the neck and shoulders, an accurate fitting is assured, and this means a comfortable splint. The total cost of materials does not exceed \$4, and the delay between ordering and delivering the collar to the patient need never be more than thirty hours.

## BUILDING THE COLLAR

Measurements are taken of the approximate lengths of the chin support, the shoulder strips, the front and back cross pieces which connect the extremities of the shoulder strips and the two struts on each side which anchor the chin piece to the chest portion. The pieces for the chin support are made by folding over one third of the width of the 'specialist splint' lengthwise so that it measures approximately  $3\frac{1}{2}$  inches instead of 5 inches wide. This also reinforces one margin which is

much appreciated during warm weather, and at the same time reduces the weight of the collar.

After the initial outline of the dressing has been completed, each strip is reinforced until the desired thickness is obtained.

While the plaster is setting on the patient, the restraining pad for the back of the neck can be made. Ten to twelve thicknesses of 5 inch splints cut to the desired length are molded to the contour of the posterior surface of the head, neck and shoulders. In some cases a strap of 1 inch webbing over a felt pad across the back of the neck is sufficient to prevent the patient from lifting his chin out of the collar.

When the plaster has become sufficiently hardened, the collar is carefully removed and placed under a lamp or on a radiator for rapid drying. The margins are trimmed and sandpapered so that no rough or pointed edges are present to irritate the skin. In order to give additional strength to the collar and at the same time make it waterproof and prevent undue soiling, five coats of the following mixture are applied to the plaster.

Sufficient acetone is added to  $\frac{1}{4}$  gallon of cellulose acetate to make 1 gallon of mixture. To this 6 ounces of dimethyl phthalate is added and sufficient titanium dioxide to impart a white color.

Finally, 1 inch straps and buckles are applied, as shown in the illustrations. Ordinarily, soft padding is not required for the chin or shoulders if the collar conforms smoothly to the contours of the part and the head was held in a comfortable position during its building.

## CHRONIC LYMPHATIC LEUKEMIA

REPORT OF A CASE, WITH SURVIVAL FOR SIXTEEN YEARS

G GILL RICHARDS, M.D., AND LOUIS G MOENCH, M.D.,  
SALT LAKE CITY

Few diseases are more puzzling than the leukemias. Practically nothing is known of their etiology, no specific curative treatment is known, the prognosis is uniformly poor, even the length of survival varies within wide limits.

In chronic lymphatic leukemias the survival period averages around three years. Dowdy and Lawrence<sup>1</sup> found an average of 2.7 years in a series of 20 cases, with the longest five years. In a series of 87 cases, Minot and Isaacs<sup>2</sup> found an average survival period of two years, with the longest twenty-two years. Murphy's<sup>3</sup> cases averaged 3.45 years, but in 1 case there had been symptoms for twelve years, and in 3 cases chronic lymphatic leukemia had been diagnosed for more than nine years. McGavran<sup>4</sup> reported a case of twenty-five years' duration. Hunter<sup>5</sup> observed that the disease seems more benign in patients over 65 and noted an occasional nine or ten year survival.

Our patient is still alive sixteen years after his original diagnosis of chronic lymphatic leukemia.

E. R. B., a white man, was first seen Jan. 4, 1926 at the age of 68, with complaints of irregularity of the heart, moderate dyspnea on exertion and "gas on the stomach." His family and past history were not remarkable. Examination showed that he was well nourished and fairly well preserved. His heart measured 4 cm. to the right and 8 cm. to the left of the midsternal line at the apex, with normal rate, rhythm, shape and sounds. The liver and spleen were not palpable. An inguinal hernia was found, and both legs showed moderately extensive varicose veins. The teeth were extensively involved with pyorrhea alveolaris, and roentgenograms showed apical molar abscesses. Gastric analysis showed an absence of free hydrochloric acid. Roentgenograms of the stomach were negative. The blood Wassermann reaction was negative. Urinalysis was within normal limits. The blood count revealed 95 per cent hemoglobin (Sahli), 5,440,000 red cells and 73,700 white cells, with a differential count of 6 per cent polymorphonuclear leukocytes, 93 per cent lymphocytes, 1 per cent eosinophils, many degenerate lymphocytes not counted, anisocytosis, macrocytosis and microcytosis. Three days later the white blood count was 66,300 with 92 per cent lymphocytes.

While still under observation, the patient contracted an influenzal type of infection of the upper respiratory tract, and ten days later the white blood count had dropped to 30,300 with 78 per cent lymphocytes, but the count had increased to 58,100 one week later. He was instructed to use dilute hydrochloric acid with his meals and advised to have his teeth repaired. No other treatment was thought advisable.

Twelve years later (July 14, 1938) the patient was seen again, at the age of 80, with complaints of diarrhea, sore mouth and exertional dyspnea. He had been able to work around his ranch until two years previously and was still able to get around on horseback. His physical examination was identical with the last except for a salmon-red color of the oral mucosa, rales at the bases of both lungs and severe prostatic hypertrophy without nodulation. The tongue was not smooth. Lymph nodes were not palpable. Gastric fluoroscopy and roentgen examination were negative. Blood counts showed 70 per cent hemoglobin, 2,100,000 red cells, 30,600 white cells (59 per cent small lymphocytes, 23 per cent large lymphocytes, 9 per cent polymorphonuclear leukocytes, 9 per cent lymphoblasts, 2 per cent reticulocytes). The smear also showed macrocytosis, microcytosis, poikilocytosis and polychromasia. He was instructed

to start taking a proprietary antianemic preparation comprising concentrated stomach tissue extract, iron and vitamin B<sub>1</sub> and B<sub>2</sub>,<sup>6</sup> and his dilute hydrochloric acid was increased.

The patient was next seen Sept. 24, 1941 at the age of 83, with complaints of numbness of the legs, dyspnea and "gas on the stomach." He had been taking the concentrated antianemic stomach tissue product and dilute hydrochloric acid. His examination was not remarkably changed except for increased weight, increased emphysema, extensive varicosities of the legs and poor pulsation of the dorsalis pedis arteries. The liver and spleen were not palpable. There were no palpable lymph nodes. The blood count showed 90 per cent hemoglobin, 3,750,000 red cells and 28,000 white cells. The smear showed 80 per cent lymphocytes and 20 per cent leukocytes, with slight anisocytosis, macrocytosis and hyperchromasia. The hematocrit reading was 42.5. He was instructed to reduce his weight, institute Buerger's leg exercises, and continue with the dilute acid and the antianemic stomach tissue product.

## COMMENT

There is a tendency to be gloomy about the prognosis in the leukemias, yet they may run a comparatively benign course. Recourse to irradiation and protoplasmic poisons is almost universal, yet in the case here described no such treatment has been given and the disease is still relatively innocuous after sixteen years.

115 East on South Temple

## Council on Pharmacy and Chemistry

## REPORT OF THE COUNCIL

THE COUNCIL HAS AUTHORIZED PUBLICATION OF THE FOLLOWING REPORT  
AUSTIN E. SMITH, M.D., Acting Secretary

## DIETHYLSTILBESTROL

Diethylstilbestrol was first developed in 1937 by Dodds and his co-workers<sup>1</sup> and has been commercially available in Europe and Canada since 1939. It has been recently released for sale in this country by the Food and Drug Administration. This substance is a potent estrogen bearing only slight chemical relationship to the hormonal steroids. It is synthesized in the laboratory from nonbiologic chemicals. The relative inexpensiveness and certain properties of this substance offer several advantages over the natural estrogens and for this reason it has aroused considerable interest among physicians.

Diethylstilbestrol, or, as it is known chemically, 4,4'-dihydroxy- $\alpha$ ,  $\beta$ , diethylstilbene, or  $\alpha$ ,  $\alpha'$ -diethyl 4,4'-stilbenediol, is a white, crystalline powder occurring in two forms which are usually separable. The trans-form has a greater estrogen potency than the cis-form. Stilbestrol is the term designating the mother substance 4,4'-hydroxy stilbene, it is much less active than the diethyl derivative.

## PHYSIOLOGY

It has been adequately demonstrated that diethylstilbestrol is capable of producing practically all the physiologic effects of natural estrogens,<sup>2</sup> thus it will induce vaginal estrus, stimulate growth of the endometrium and myometrium, sensitize the uterus to the action of progesterone, cause rhythmic contraction of the uterus, develop the ductile tissues of the breast, change the alkaline vaginal secretion to acid and cause the appearance of glycogen in the vaginal mucosa. It is also capable of inhibiting

ing some of the secretions of the anterior pituitary, resulting in ovarian or testicular atrophy, cessation of growth and suppression of lactation. There are several differences between the action of diethylstilbestrol and the natural estrogens. Thus it has been demonstrated that the synthetic estrogen is unable to increase the acetylcholine content of the uterus which is obtained with the natural estrogen,<sup>3</sup> nor is it able to produce the ovipositor reaction in the female bitterling. In addition, it has been demonstrated that, unlike natural estrogens, diethyl-

stilbestrol does not inhibit the action of androgens in producing comb growth of fowl. The metabolism of diethylstilbestrol is somewhat different from that of the natural estrogens in that it is not destroyed to as great an extent by the liver and thus more is excreted in the urine, from 10 to 30 per cent of injected diethylstilbestrol being excreted within a few days.<sup>4</sup> This estrogen is not significantly more potent than the natural estrogens in promoting the growth of tumors or malignant growths in experimental animals.

While it is acknowledged that diethylstilbestrol is highly potent, there is some difference of opinion as to the degree of estrogenicity which it possesses. Table 1 indicates the activity in the mouse and the rat of diethylstilbestrol as obtained by various workers.

One of the most significant properties of diethylstilbestrol is its relatively high degree of activity when administered by mouth. Originally there were claims that it was as effective by mouth as by injection. Subsequently it appears that there is considerable loss of activity when administered by mouth but apparently not as much as that with the natural estrogens. A sufficiently high percentage remains undestroyed to allow for an effective response when given orally. Table 2 indicates the relative oral and parenteral activity of diethylstilbestrol as tested in different laboratories.

This substance, as with the natural estrogens, is active by percutaneous administration in ointments and tinctures.

In the human being the physiologic responses are similar to those obtained with natural estrogens. Thus, women with infantile reproductive organs respond to diethylstilbestrol with typical feminizing changes, such as growth of the uterus and of the breasts and pigmentation of the areolas. Uterine bleeding follows the cessation of administration of sufficient amounts.

#### THERAPY

Since the availability of diethylstilbestrol, large numbers of reports have appeared in the scientific literature indicating that this substance is capable of complete replacement therapy in the menopausal or castrate woman.<sup>5</sup> Most authors report their inability to detect a significant difference in subjective relief between diethylstilbestrol and the natural estrogens in alleviating the symptoms of the menopause. Some claim that the sense

of well-being following the use of natural estrogens is not obtained with diethylstilbestrol. The consensus, however, indicates that satisfactory and gratifying results can be obtained in most menopausal women with the oral dosage of 0.5 to 10 mg daily. Some physicians prefer to start with small dosages and increase this until therapeutic results are obtained. Implantation of pellets of the synthetic material has been used experimentally in treating this condition.<sup>6</sup> In addition to relieving symptoms of the menopause, it is also capable of benefiting other conditions complicating the menopause such as senile vaginitis and kraurosis vulvae.<sup>7</sup> Gonorrheal vaginitis is also satisfactorily treated with the synthetic estrogen either by oral or by parenteral administration.<sup>8</sup> The aforementioned conditions are the only ones in which the Council on Pharmacy and Chemistry has approved the usefulness of estrogen therapy up to the present time.

In addition to these, there is considerable evidence that this estrogen in the proper dosage is beneficial in the suppression or prevention of lactation.<sup>9</sup> While there is no reason to believe that natural estrogens are not equally capable of producing the appropriate changes in this condition, there is little evidence of this nature in the literature, probably owing to the fact that natural estrogens are not readily available in the proper high dosage forms for this purpose. On the other hand, diethylstilbestrol can easily be administered in almost unlimited doses and has been shown to be effective in preventing the onset of lactation when administered soon after parturition. The engorgement of the breast is prevented to a great extent, and lactation fails to proceed. When diethylstilbestrol is administered after the onset of lactation, the results are not as conclusive or as dramatic. Lactation will not cease under those conditions where nursing is continued.<sup>10</sup> Even without the stimulus of nursing, it appears that the longer lactation has ensued the more difficult it is to suppress. The average dose of diethylstilbestrol for the suppression of lactation is 15 mg by mouth daily for three to ten days. The Council has reviewed the available evidence and has concluded that the suppression of lactation and painful engorgement of the breast is a worthwhile therapeutic measure and has added it to the list of indications for inclusion in New and Nonofficial Remedies under Actions and Uses.

Estrogens have been used extensively in the treatment of various menstrual disorders such as amenorrhea, excessive or irregular bleeding and dysmenorrhea. The Council has to date recognized none of these conditions as indications for estrogen therapy because of the lack of satisfactory evidence as to the benefit obtained from such therapy. It is well known that in

bleeding<sup>11</sup> Following the daily administration of 5 to 10 mg for ten to fifteen days, uterine bleeding often ensues within about ten days following cessation of therapy. For a repetition of this response another course of therapy is required. At the present time it appears that such treatment results in a possible cure of the condition in only a small percentage of cases. The induction of bleeding in the majority of these cases is not as yet considered of sufficient therapeutic significance to warrant recognition as a worthwhile procedure except in the hands of specialists.

In the treatment of excessive bleeding, results are encouraging in indicating that this substance may be of considerable value. There is some evidence that large doses of natural estrogens will suppress profuse and irregular bleeding, but this field for therapy has not been adequately explored. With the advent of synthetic estrogens, the necessary large doses for such a practice can be easily administered. Thus it has been demonstrated that the daily oral administration of 5 to 10 mg of diethylstilbestrol will control many cases of functional bleeding for the duration of the treatment.<sup>12</sup> The permanence of these results is still open to question, but it is believed that the simple control of uterine hemorrhage is a worthwhile procedure, especially in those cases which in the past would require hysterectomy, ovariectomy or other medical methods. Additional evidence on this phase may be shortly forthcoming.

Other conditions which have been treated with varying success, but which may also be considered experimental, are prostatic neoplasms, hypersexuality in the male, uterine involution, abortion and Cushing's disease.

#### TOXICOLOGY

The question of the possible harmful effects of diethylstilbestrol has prevented the ready acceptance of the compound for therapeutic purposes in this country. The first reports on the toxicity of diethylstilbestrol in experimental animals and in man indicated the possibility that this substance produces damage to the various body organs and tissues.<sup>13</sup> Thus, it is recorded that administration of this material to certain experimental animals produced changes in the bone marrow, giving rise to an aplastic anemia with leukopenia and thrombocytopenia. Furthermore, signs of kidney and liver damage were obtained as well as occasional hemorrhage into the adrenals. Subsequent work has shown conclusively, however, that such changes in animals could be obtained only with relatively large doses of the estrogen and that similar changes also resulted from the use of equal amounts of natural estrogens such as estrone or estradiol.<sup>14</sup> Other experimental work is in agreement that amounts far in excess of the physiologic dose are harmless.<sup>15</sup> There is thus little evidence to indicate that the toxicity of diethylstilbestrol is significantly greater than that of the natural estrogens. One group of experimenters has claimed that the suppression of growth following diethylstilbestrol administration to rats is irreversible because of changes in the epiphyseal cartilage, while natural estrogens induced a reversible stunting of growth. There is evidence, however, to indicate that the

suppression of growth by diethylstilbestrol could be relieved by the administration of anterior pituitary growth hormone extracts, thus indicating the reversibility of the growth changes. The earlier work reported evidence that liver damage could result from diethylstilbestrol administration in therapeutic doses in the human being. In addition, it was claimed that this substance produced occasional psychosis, dermatologic changes and certain neurologic changes such as paresthesias and vertigo. Adequate confirmation of this work has not been reported. It has been demonstrated that therapeutic doses of diethylstilbestrol have little or no harmful effects on the liver as well as other tissues.<sup>16</sup> In this connection it is interesting that in experimental animals diethylstilbestrol will cause a deposition of liver glycogen, a significant reaction when it is considered that substances which damage liver produce a depletion of glycogen. In the human being, therefore, there are no data which indicate damage to blood forming elements, liver, kidney or other tissues.

Practically every investigator who has used this estrogen in man has encountered untoward symptoms. These symptoms consist chiefly of nausea, vomiting, dizziness, headache and nervousness, the most predominating complaints being those from the gastrointestinal tract. The incidence of these disagreeable symptoms varies considerably according to the different investigators. One group had reported an incidence of 80 per cent of toxic manifestations, the majority being epigastric distress. In large series of cases, however, it appears that the incidence of toxic symptoms on dosages of 0.5 to 20 mg daily is 10 to 20 per cent. Most investigators agree that the incidence of untoward reactions is greater with larger therapeutic doses. There have been proposed a number of theories as to the cause of the toxic reactions. Irritation of the gastric mucosa, locally, was considered at one time the possible mechanism for the epigastric distress. This hypothesis has been dismissed because of the fact that similar symptoms result from the injection of this material as well as from the use of ointments. For this reason, therefore, the use of enteric coated tablets does not appear justified. It has been suggested that the nausea and vomiting is the result of depression of gastric acidity, which occurs to a slight extent.<sup>17</sup> Several women with symptoms of nausea and vomiting demonstrated on gastroscopy an edema of the gastric mucosa.<sup>18</sup> Such a change, of course, would in all probability account for the symptoms and would also account for a depression of gastric acidity. The mechanism of the mucosal edema is unknown at the present time, but it has been suggested that this is the result of water retention of the intestine on the basis of sodium ion retention.<sup>18</sup> Natural estrogens and other steroids possess the ability of inducing similar electrolytic changes. It has also been postulated that the unpleasant symptoms from diethylstilbestrol administration are the result of its rapid absorption into the body, giving rise to a condition which may be similar to that of early pregnancy, when there is likewise an elevation of the estrogen titer of the body fluids.<sup>19</sup> Many patients on diethylstilbestrol thereby report that they feel much the same as during pregnancy. This concept is supported by evidence that women who have been recently pregnant, and thus saturated with estrogens, rarely if ever develop untoward symptoms following large doses of diethylstilbestrol. Furthermore, diethylstilbestrol dipropionate, which is more slowly absorbed than the free compound, gives rise to a considerably lesser incidence of toxicity.<sup>20</sup> Unpublished work with diethylstilbestrol dipalmitate,<sup>21</sup> a preparation which is absorbed even more slowly, demonstrates that gastro-

intestinal symptoms rarely developed in women who received injections of 5 mg of the substance, while similar quantities of diethylstilbestrol induced nausea in 40 per cent of the cases. Other symptoms such as dizziness, headache and nervousness were also absent which would lead one to suspect that these are on the same physiologic basis as the gastrointestinal symptoms.

#### CONCLUSION

Diethylstilbestrol, a synthetic compound, is a potent estrogen effective by mouth as well as by injection and intrunction. This substance is a reliable therapeutic agent for those conditions which have been recognized by the Council as suitable for estrogen therapy, namely the symptoms of the menopause including other conditions relating to deficiency of estrogens such as senile vaginitis, kraurosis vulvae and pruritus vulvae and gonorrheal vaginitis of children. In addition, the Council recognizes the use of diethylstilbestrol in the appropriate doses for the suppression or prevention of lactation under certain conditions. In the treatment of ovarian disturbances, diethylstilbestrol and natural estrogens have been demonstrated to be of some benefit in treating functional uterine bleeding, either menorrhagia or menometrorrhagia but further evidence is awaited before a proper evaluation of this therapy can be made. The question of the toxicity of diethylstilbestrol is still not completely settled but it appears most likely that this substance is not significantly more damaging to the tissues than the natural estrogens. Proof that diethylstilbestrol, in therapeutic doses is harmful has not been presented. The development of unpleasant symptoms following diethylstilbestrol administration is apparently not the result of pathologic changes in organs, and these symptoms may be obviated to a considerable extent by the use of smaller than average doses in initiating therapy.

In view of the evidence presented in this report that diethylstilbestrol is an effective estrogen the Council voted to accept this substance for inclusion in New and Nonofficial Remedies for a period of one year, at the end of which time a reevaluation of this substance with regard to toxicity will be made for further action.

### NEW AND NONOFFICIAL REMEDIES

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION.

AUSTIN E. SMITH, M.D., Acting Secretary

#### DIETHYLSTILBESTROL

Dodds and his co-workers after extensive experimentation with synthetic substances, recognized the estrogenic activity of the stilbene compounds. Diethylstilbestrol is the most potent of these compounds described up to the present time. It may be prepared in a variety of ways from nonbiologic organic chemicals. Its physiologic activity duplicates practically all the known actions of natural estrogens. Thus it induces estrus in rodents, stimulates the growth of the endometrium and myometrium, primes the endometrium for progestational changes, causes reddening of the sex skin of monkeys and feminization of the plumage of birds, induces growth of mammary ducts in female and male animals as well as in human beings, raises the blood fat and calcium in fowl, induces uterine bleeding in castrate animals and human beings and suppresses ovulation as well as inhibits the secretion of various factors of the anterior pituitary gland resulting in stunting of growth, inhibition of lactation and atrophy of the gonads. It differs in its action from natural estrogens in its inability to cause the ovipositor reaction of the female bittern and to antagonize the action of androgens on comb growth of capons. The therapeutic use has been demonstrated to be effective for all those conditions recognized to respond to the natural estrogens. Various modifications of diethylstilbestrol have been devised such as fatty acid esters and a number of ethers for increasing the estrogenic efficiency of this substance. These are at present the subject of clinical and physiologic investigations. Diethylstilbestrol possesses the advantage of being relatively active by mouth as well as parenterally. The ratio of potency between oral and parenteral administration varies in the hands of different investigators

from 1/2 to 1/5 in the human being as well as in rodents. In the therapeutic use of diethylstilbestrol there may be a significant incidence of side reactions, the most common of these being nausea, vomiting and headache. It has been considered that these were the result of tissue damage, but no evidence has been presented that therapeutic amounts are actually harmful to human beings and there appears to be conclusive evidence that experimentally diethylstilbestrol is not significantly more toxic than the natural estrogens. It is now considered that the unpleasant symptoms arising from diethylstilbestrol administration are systemic in origin rather than local, probably because of its rapid absorption into the blood stream since few untoward symptoms are observed with the use of diethylstilbestrol compounds which are slowly absorbed from the site of administration.

**DIETHYLSTILBESTROL**— $\alpha$ - $\alpha'$ -diethyl-4,4'-stilbenediol—3,4-bis-(*p*-hydroxyphenyl)-3-hexene— $C_{26}H_{28}O$  (M. W. 268.34). Diethylstilbestrol has the following structural formula:

It may be prepared from anisaldehyde by (a) refluxing with an aqueous alcoholic solution of potassium cyanide to form anisoin, (b) reduction of the anisoin to desoxyanisoin, (c) ethylation by means of ethyl iodide and sodium ethylate to form ethyldesoxyanisoin, (d) treatment with ethyl magnesium bromide to form 3,4-dianisyl-3-hexanol, (e) dehydration to form diethylstilbestrol dimethyl ether and (f) demethylation by treatment with alcoholic potassium hydroxide to form diethylstilbestrol. The product thus obtained may be purified by recrystallization from dilute alcohol.

**Actions and Uses**—This compound is indicated for estrogen therapy in the following conditions: menopausal symptoms, senile vaginitis, kraurosis vulvae and gonorrheal vaginitis of children. It is also of value in suppressing painful engorgement of the breasts in the puerperium and the inhibition of lactation under certain conditions.

**Dosage**—The average therapeutic dose for the treatment of menopausal symptoms is 0.5 to 1.0 mg. daily by mouth, although it is advised to start with smaller doses for patients who tend to develop disagreeable symptoms. Courses of therapy with periods of a few weeks of no treatment are recommended by some authorities. Injection of similar quantities of diethylstilbestrol in oil solution are administered one or more times weekly. Ointment or suppositories containing this material may be used for topical applications in the treatment of vulvar and vaginal conditions. The contraindications to this substance are similar to those for natural estrogens, namely familial or personal history of malignancy of the reproductive organs.

#### Tests and Standards

Diethylstilbestrol occurs as a white odorless crystalline powder which melts at 169-171.5°C. When recrystallized from the various classes of solvents, diethylstilbestrol forms crystals containing one molecule of solvent of crystallization which is lost with relative ease on drying at 80°C. As a consequence the commercial product when viewed under the microscope appears as a fine powder or as pitted crystals showing evidence of loss of solvent of crystallization. When diethylstilbestrol is recrystallized from dilute ethanol and observed under the polarizing microscope before drying, the crystals appear as highly birefringent elongated rectangular plates exhibiting oblique extinction and positive biaxial character with many views showing an optic axis and occasionally the acute bisectrix. The optic angle is relatively large.

Diethylstilbestrol is readily soluble in ether, chloroform, benzene, ethanol, methanol and dilute sodium hydroxide; soluble in vegetable oils, slightly soluble in acetone and dilute ethanol; very slightly soluble in water and insoluble in dilute mineral acids.

Dissolve approximately 10 mg. of diethylstilbestrol in 10 cc. of dilute alcohol and add three drops of 1 per cent ferric chloride solution; a yellowish green color develops which changes to yellow. Add a few drops of 50 per cent solution of antimony pentachloride in dry alcohol free of chloroform to a very dilute solution of diethylstilbestrol in the same solvent; a red colored solution is produced. More concentrated solutions give a heavy red precipitate. Dissolve 10 mg. of diethylstilbestrol in concentrated sulfuric acid; an orange color is produced which disappears on dilution with water.

Prepare the diacetate of diethylstilbestrol by refluxing 100 mg. of diethylstilbestrol with 2 cc. of pyridine and 1 cc. of acetic anhydride for five minutes. Dilute with 20 cc. of water, filter the precipitate, wash several times with water and dry. Recrystallize the product from dilute ethanol and dry; the melting point is from 122°C. to 123.5°C. When viewed under the polarizing microscope crystals of the diacetate derivative appear as long rods exhibiting partial parallel extinction and a positive biaxial character. The refractive indexes are  $n_D = 1.530$ ,  $n_F = 1.560$  and  $\gamma > 1.635$ .

Dry an accurately weighed specimen of diethylstilbestrol to constant weight at 100°C.; the loss does not exceed 0.5 per cent. Ignite an accurately weighed specimen of diethylstilbestrol after the addition of concentrated sulfuric acid; the sulfated ash residue is not more than 0.05 per cent. Dissolve 0.1 Gm. of diethylstilbestrol in 10 cc. of warm

normal sodium hydroxide solution, dilute to 20 cc with distilled water and add five drops of 10 per cent sodium sulfide solution the darkening produced does not exceed that of a control to which has been added 0.02 mg of lead.

Transfer 0.1 Gm of diethylstilbestrol to a 100 cc volumetric flask, add 6 cc of 10 per cent sodium hydroxide solution and 30 cc of distilled water, shake to dissolve the diethylstilbestrol, then dilute to the mark with distilled water. Transfer 10 cc of the solution to a 250 cc iodine flask, fitted with an accurately ground stopper, add 10 cc of tenth normal bromide bromate solution (prepared according to the U S P XI, p 565), wash the walls of the flask and wet the stopper by the addition of 20 cc of distilled water. Quickly add 5 cc of 10 per cent hydrochloric acid and insert the wet stopper. Shake the mixture thoroughly for several minutes, then set aside in the dark and shake intermittently for thirty minutes. At the end of this period place 5 cc of 10 per cent potassium iodide solution around the stopper. Remove the stopper just enough to allow the potassium iodide solution to enter the flask, shake thoroughly, rinse the stopper and sides of the flask with distilled water and titrate with fiftieth normal sodium thiosulfate, using starch solution as the indicator near the end of the titration. Each cubic centimeter of tenth normal bromide bromate solution is equivalent to 2.064 mg of diethylstilbestrol. The diethylstilbestrol content is not less than 100 per cent.<sup>1</sup>

#### COLORIMETRIC ASSAY FOR DIETHYLSTILBESTROL

The following method based on the Folin Denis method for the detection of phenols<sup>2</sup> has been found reliable for the assay of diethylstilbestrol in tablets, oil solution and suppositories.

#### Reagents

##### 1 Standard diethylstilbestrol solution

Prepare a solution containing 0.1 mg of diethylstilbestrol per cubic centimeter as follows. Dissolve 50 mg of diethylstilbestrol in 100 cc of 95 per cent ethanol. Transfer 10 cc of this solution to a 50 cc volumetric flask, dilute to the mark with 50 per cent ethanol and shake well.

##### 2 Sodium hydroxide 1 N (4 per cent)

##### 3 Hydrochloric acid 10 per cent

##### 4 Saturated aqueous solution of sodium carbonate

Dissolve 35 Gm of anhydrous sodium carbonate in 100 cc of warm distilled water, allow the solution to cool, seed the supersaturated solution with a crystal of sodium carbonate and allow to stand one hour before using.

##### 5 Folin Denis solution

Place 350 cc of distilled water, 50 Gm of sodium tungstate, 12 Gm of phosphomolybdic acid (containing 72 per cent MoO<sub>3</sub>) and 25 cc of 85 per cent phosphoric acid in a 500 cc glass stoppered, round bottom flask. Boil under reflux for two hours, cool and dilute to 500 cc.

#### Procedure

Transfer 2 cc of the standard diethylstilbestrol solution to a 50 cc volumetric flask. Into a similar flask transfer a volume of the unknown solution equivalent to 0.2 mg of diethylstilbestrol. If the unknown solution contains alkali, add sufficient dilute hydrochloric acid to render the solution very slightly acid. Add to both flasks 1 cc of 10 per cent hydrochloric acid, 1 cc of the Folin Denis reagent and sufficient distilled water to make 30 cc. Shake and allow to stand for ten minutes. At the end of this period add 5 cc of saturated sodium carbonate solution, dilute to the mark with distilled water, mix thoroughly and allow to stand for twenty minutes. At the end of this period the solutions are filtered if necessary, and compared in a colorimeter. The comparison is facilitated by the introduction of a red filter in the light path.

**NOTE**—Tannins and other phenols interfere with this reaction. The presence of most phenols and salicylic acid in the extracts can be detected by the ferric chloride test, since diethylstilbestrol gives only a pale green yellow solution with this reagent. Tablet excipients such as starch, sugars, talc or calcium carbonate and preservatives such as chlorobutanol produced no color with this reagent.

#### Preparation of Extracts

##### (a) Diethylstilbestrol in oil

An amount of oil equivalent to 2 mg of diethylstilbestrol is transferred to 20 cc of petroleum ether contained in a separatory funnel. This solution is extracted six times with small portions of 1 N sodium hydroxide, the extracts are diluted to 50 cc with distilled water and filtered through a filter paper previously moistened with water. The first 10 cc of the filtrate is discarded, 5 cc (0.2 mg diethylstilbestrol) of the remaining solution is transferred to a 50 cc flask and assayed in the manner already described. **NOTE**—Certain vegetable oils contain phenolic derivatives (e.g. sesamol in sesame oil), which lead to erroneous results. Therefore it is necessary, particularly for dosage forms containing less than 2 mg per cubic centimeter of oil to prepare the standard by addition of an equivalent amount of the same kind of oil, free from diethylstilbestrol, to a separator containing 20 cc of petroleum ether followed by the addition of the requisite amount of crystalline diethylstilbestrol and to follow the extraction procedure indicated for the dosage forms.

##### (b) Diethylstilbestrol in gelatin glycerin suppositories

A number of suppositories equivalent to 1 mg of diethylstilbestrol are dissolved in 20 cc of hot distilled water containing 4 cc of 1 N sodium hydroxide. This solution is transferred quantitatively to a small separatory funnel by means of distilled water containing a few drops of 1 N sodium hydroxide. The contents of the funnel are neutralized with 10 per cent hydrochloric acid, and 5 cc excess is added. The acid solution is extracted six times with ether. The combined ether extracts are dried with a small quantity of anhydrous sodium sulfate and decanted into a small distilling flask. The sodium sulfate is rinsed with several portions of ether, and this is added to the main portion of the ether extract. The ether is now distilled to dryness on the water bath, the residue is dissolved in exactly 10 cc of ethanol, and 2 cc of the resulting solution is transferred to a 50 cc flask and assayed as described.

<sup>1</sup> The nature of the reaction between bromine and diethylstilbestrol leads to complications unless the conditions of a given procedure are strictly observed. It has been found that the procedure given above tends to yield results which are somewhat higher than 100 per cent. This method of standardization must be considered tentative until more accurate analytic procedures are available.

<sup>2</sup> Folin, Otto, and Denis, W. J. Biol. Chem. 12: 239, 1912.

#### (c) Diethylstilbestrol in tablets

In certain instances when the tablet contains only sugar and small amounts of starch as excipients, it has been found possible to dissolve the tablet directly in 0.5 N sodium hydroxide and to use an aliquot of this extract for assay. However, in the presence of large quantities of starch and in the case of enteric coated tablets where the excipient formed gelatinous precipitates, the following procedure has been found satisfactory.

A number of uncoated tablets equivalent to approximately 2 mg are allowed to disintegrate in a separator containing approximately 30 cc of distilled water. (The number of tablets used will depend largely on the quantity of diethylstilbestrol in the tablet. In the case of 0.1 mg tablets the quantity of excipients introduced into the separator funnel produces disturbing emulsions if a number equivalent to 2 mg of diethylstilbestrol is used. Therefore, 5 or 10 tablets are generally used in this case.) In the case of enteric coated tablets the water soluble dye is removed by rotating gently in distilled water followed by several rinsings, the calcium carbonate layer is removed by treatment with dilute hydrochloric acid and the tablets are next crushed in a test tube with a blunt end rod and the powder is transferred quantitatively to a separator containing 30 cc of distilled water. Five cc of 10 per cent hydrochloric acid is added and the same extraction procedure followed as described in (b).

**DIODRAST COMPOUND SOLUTION**—An aqueous solution containing approximately 40.5 per cent (W/V) of the diethanolamine salt of 3,5-diiodo-4-pyridone-N-acetic acid and approximately 9.5 per cent (W/V) of the diethylamine salt of 3,5-diiodo-4-pyridone-N-acetic acid. Diodrast compound solution contains about 25 per cent (W/V) of iodine in organic combination.

**Actions and Uses**—Diodrast compound solution is employed for roentgenographic visualization of the urinary tract by intravenous injection or by direct injection into the renal pelvis through a ureteral catheter. It is designed to provide a relatively large amount of iodine in a small volume of solution particularly for injection of obese subjects or for patients who cannot or will not cooperate in the preliminary preparation for excretion urography with diodrast. It is usually unnecessary to expose more than one or two films. Delayed, incomplete or absent shadows are given the same interpretation as when diodrast is employed. The same contraindications and precautions should be observed as for diodrast.

**Dosage**—For excretion urography, diodrast compound solution is administered intravenously in sterile aqueous solution, the average dose for adults being 20 cc. Diodrast Compound Solution may be employed without dilution for retrograde pyelography. For economy, more dilute solutions are customarily used with satisfactory results. Eight cc of Diodrast Compound Solution (50 per cent concentration of radiopaque material) when diluted with 12 cc of sterile distilled water yields 20 cc of 20 per cent concentration. Five cc of Diodrast Compound Solution diluted with 15 cc of sterile distilled water (final concentration 12.5 per cent) gives wholly satisfactory pyelograms, this dilution is generally employed with excellent results in thin individuals. The volume of fluid generally required for retrograde examination in adults is 20 cc.

#### Tests and Standards

Diodrast compound solution is prepared by neutralizing 3,5-diiodo-4-pyridone N-acetic acid in water with appropriate quantities of diethanolamine and diethylamine. The mixture thus formed (not isolated in solid form) is soluble in water.

Diodrast compound solution occurs as a clear, pale yellow, odorless liquid, possessing a bitter taste. It is neutral to litmus and is incompatible with mineral acids and heavy metal salts. Its specific gravity is about 1.270 at 25°C.

Dilute about 0.5 cc of diodrast compound solution to 5 cc with water and acidify with hydrochloric acid, collect the precipitate on a filter, wash with cold water and dry at 100°C. The 3,5-diiodo-4-pyridone N-acetic acid obtained melts at 245-249°C with decomposition (the melting point both previously heated to 200°C).

Dilute about 1 cc of diodrast compound solution with 20 cc of water, add 5 cc of approximately 50 per cent sodium hydroxide solution and distill into about 25 cc of normal hydrochloric acid. Evaporate the solution containing the distillate to dryness on a water bath, recrystallize the residue from alcohol by the addition of diethyl ether, dry the product under partial vacuum. The melting point of the diethylamine hydrochloride obtained is from 224 to 227°C with solidification.

Acidify the alkaline residue remaining in the distilling flask with dilute hydrochloric acid, remove the solution from the flask and evaporate to about one third of its volume. Cool the concentrated solution in ice water for fifteen minutes with occasional shaking, filter and concentrate the filtrate to a syrup. Treat the syrupy residue with 5 cc of absolute alcohol, neutralize dropwise with normal sodium hydroxide, filter, wash and finally dilute the filtrate to about 8 cc with alcohol. Add about 0.5 Gm of picric acid (trinitrophenol) to the solution, cool and place in the ice chest. Collect the precipitate on a filter, recrystallize from absolute alcohol and dry under partial vacuum. The melting point of the diethanolamine trinitrophenolate obtained is between 109 and 110°C.

Dilute 20 cc of diodrast compound solution, accurately measured to 200 cc in a calibrated flask. Use portions of the diluted solution for the following determinations.

Evaporate 20 cc of the diluted solution accurately measured in a tared platinum dish on a water bath and dry to constant weight at 100°C. The weight of the residue is equivalent to not less than 40 per cent (W/V) nor more than 51 per cent (W/V) calculated from the original solution. Ash the residue in the presence of sulfuric acid. The weight of the ash obtained is equivalent to not more than 1 per cent.

Transfer 20 cc. of the diluted solution to an ammonia distillation apparatus add 50 cc of water 5 cc of 50 per cent sodium hydroxide and distill into 30 cc of fiftieth normal hydrochloric acid Titrate the excess acid with fiftieth normal sodium hydroxide using methyl red as the indicator the amount of fiftieth normal hydrochloric acid consumed by the distilled diethanolamine is equivalent to not less than 14 per cent (W/V) and not more than 17 per cent (W/V) calculated to the original solution

Acidify the residue remaining in the Kjeldahl flask used in the foregoing determination with sulfuric acid Concentrate the mixture and digest with 10 cc. of sulfuric acid and 0.5 Gm of selenium metal until clear Cool dilute with 100 cc of water transfer to the ammonia distillation apparatus and add in excess of 50 per cent sodium hydroxide Distill into 50 cc of tenth normal hydrochloric acid and titrate the excess acid with tenth normal sodium hydroxide using methyl red as the indicator the amount of tenth normal hydrochloric acid consumed by the distillate is equivalent to a diethanolamine content of not less than 8.0 per cent (W/V) nor more than 8.3 per cent (W/V)

Transfer a 10 cc portion of the diluted solution to a 50 cc beaker heat gently to boiling and add exactly 12 cc of silver nitrate solution Stir until the precipitate becomes granular cool in ice water for thirty minutes with occasional stirring filter through a tared gooch crucible using the cold filtrate to wash the beaker and wash the precipitate with 5 cc of ice cold water dry to constant weight at 110°C To the weight of the precipitate (silver salt of 3,5-diiodo-4-pyridone N-acetic acid) found add 0.00135 Gm as a solubility correction the weight of silver 3,5-diiodo-4-pyridone acetate found is equivalent to a content of 3,5-diiodo-4-pyridone-N-acetic acid of not less than 40.25 per cent (W/V) nor more than 40.6 (W/V) calculated to the original solution

SATURDAY, JUNE 20, 1942

THE ATLANTIC CITY SESSION

With 8,238 physicians registered, the Atlantic City session exceeded all expectations. Gasoline rationing on the Eastern Seaboard, it seemed, might interfere seriously with the annual session, but fortunately the interest among the medical profession was so great that physicians poured in by every possible means of conveyance. Until 1935, registration in Atlantic City had never exceeded 5,000. In that year it was 8,409, and in 1937 it was 9,764. The registration, therefore, was particularly gratifying.

The outstanding feature of the 1942 session was the attendance of visitors from Latin America, also discussed editorially in this issue. There were 140 physicians who registered from other American nations. Many of them participated in the programs of the various sections and in the general scientific meetings. They added greatly to both the interest and the glamour of the occasion.

The great convention hall in Atlantic City is obviously an attraction for any assemblage, but particularly for one like that of the American Medical Association. All the various scientific sections, the Scientific Exhibit and the Technical Exposition were housed under a single roof.

The lower floor was occupied by the Scientific Exhibit. Hundreds of exhibitors were constantly in attendance. The booths were magnificent in a blue decorative scheme. At various times some six or eight motion picture theaters were in operation, as well as special assembly halls for lectures and demonstrations on diabetes, heart disease and infantile paralysis. All these features played, in the stage vernacular, to capacity attendance. Again and again one heard the comment that the Scientific Exhibit of the American Medical Association is the greatest postgraduate training course ever assembled anywhere in the world. Our visitors from Latin America expressed their continuous amazement and gratification at the display, and many of them participated in special exhibits on tropical disease, nutritional conditions in Latin American countries and

other research projects. The Technical Exposition occupied the entire first floor of the convention hall and played likewise to capacity attendance. One exhibitor said "I would have been more than gratified with an attendance of four thousand."

The House of Delegates in Atlantic City was concerned largely with problems of organization leading to improved functions of the Association, problems related to the war and medical service plans. Portions of the minutes of the House of Delegates appear in this issue of THE JOURNAL and the remainder will be published in the weeks that follow.

One of the general scientific meetings was devoted to addresses by the inter-American guests. Another was devoted to war problems and the third to problems of general clinical importance. All these were attended by thousands of visitors. The special section meetings devoted to general practice and to legal medicine also attracted great numbers, indeed, both of the general practice sections had more than a thousand participants.

The Woman's Auxiliary had innumerable fine meetings and had developed exceptional programs of interest to workers in that field. The Auxiliary now has more than twenty thousand members, with a large House of Delegates. Its activities spread into many fields. It is proving to be a factor of great importance in promoting public health and American medicine.

Throughout the week the special qualities of Atlantic City for a session of this type became more and more apparent. All the great hotels were filled to capacity, and the innumerable dining halls and banquet rooms were used to the utmost. Many medical fraternities, clubs, alumni organizations and special societies held their meetings simultaneously with the meeting of the American Medical Association. A special dinner was tendered to the Board of Trustees by the Local Committee on Arrangements, and the Atlantic County Medical Society provided a sumptuous repast for the House of Delegates, at which Mr. Paul V. McNutt was the chief speaker. The message of Mr. McNutt on that occasion appears as the leading article in this week's issue of THE JOURNAL.

In the midst of this scientific congress the note of war was an ever present overtone. Twice during the week great convoys of ships, accompanied by destroyers and blimps, passed off shore and gave visible assurance that our nation is carrying on. From time to time interceptor planes and bombers flew out over the ocean. At night the boardwalk was dimmed out, yet hundreds of visitors walked or rode in the man propelled chairs over its pleasant paths. So the ninety-third annual session of the American Medical Association passed into history, the eleventh to be held in Atlantic City, the first annual session of World War II, a triumph in its accomplishments, a tribute to the indomitable spirit of American medicine.

### THE PRESIDENT-ELECT, JAMES E PAULLIN

The election of Dr James E Paullin, Atlanta, Ga, to the presidency of the American Medical Association by the House of Delegates at the annual session in Atlantic City is recognition of another son of the South whose career in the field of internal medicine and in the field of medical citizenship merits this high distinction. Dr Paullin was born in Fort Gaines, Ga, Nov 3, 1881. After graduation from Mercer University with the degree of bachelor of arts in 1900 he continued as a graduate student throughout 1901 and then entered Johns Hopkins University School of Medicine, from which he received the degree of doctor of medicine in 1905. He turned then briefly to pathology, acting as resident pathologist of the Rhode Island Hospital in Providence from 1905 to 1906, as resident in the Piedmont Hospital in 1906 and 1907, as pathologist to the Georgia State Board of Health from 1907 to 1911 and at the same time as associate professor of pathology of the Atlanta College of Physicians and Surgeons. In 1909 he first turned his attention to internal medicine, becoming associate visiting physician to Grady Hospital from 1909 to 1913. Then he was made visiting physician and chief of the Emory University Division, Grady Hospital. Two years later he became professor of clinical medicine at Emory University School of Medicine.

With the outbreak of World War I, Dr Paullin became major in the Medical Corps of the United States Army and served as chief of the medical service in Camp Shelby, Miss. In the field of medical organization he has come through all the ranks of organized medicine, as president of his county medical society in 1913, later of the Medical Association of Georgia, also chairman of the Section on Practice of Medicine of the American Medical Association in 1928, member of the Council on Scientific Assembly since 1933 and chairman since 1937. In the House of Delegates where he has represented the Section on Practice of Medicine he has been a member of many important reference com-

mittees and more recently a member of the Committee on Medical Preparedness of the American Medical Association. He became a fellow of the American College of Physicians in 1928 and has served at various times as regent and chairman of various committees, coming to be president-elect for 1941-42 and president for 1942-43. With the beginning of preparations for World War II he was called early to the work of the Division of Medical Sciences of the National Research Council and gave largely of his time to the classification of specialists in the field of internal medicine throughout the nation and as a member of

the Committee on Medicine of the Division of Medical Sciences of the National Research Council.

His scientific contributions have included many papers published in leading periodicals. In other scientific organizations he served as president of the American Clinical and Climatological Society in 1937 and also as chairman of the Medical Section of the Southern Medical Association. His distinction has been recognized by election to Alpha Omega Alpha and he has been guest professor of medicine at Peter Bent Brigham Hospital and at the Pratt Diagnostic Clinic of Tufts College Medical School in Boston. Early in 1942 he went to Cuba to aid in the organization of the Finlay Institute of

JAMES E PAULLIN, M.D.  
PRESIDENT-ELECT OF THE AMERICAN MEDICAL ASSOCIATION

the Americas for the securing of interchange of scientific medicine with the Latin American countries. He was decorated by President Batista with the Order of Carlos Finlay.

Thus at the inception of his term as President-Elect of the American Medical Association Dr Paullin is especially well fitted to continue the inter-American scientific development that was well initiated at the annual session which has just ended. The intimate knowledge of the development of medical personnel for our army which he acquired in serving as a member of the Board of the Procurement and Assignment Service for Physicians, Dentists and Veterinarians is an important attribute for the leadership of American medicine in these times.

### LUDVIG HEKTOEN RECEIVES DISTINGUISHED SERVICE MEDAL

The award of the Distinguished Service Medal of the American Medical Association for 1942 was made to Dr. Ludvig Hektoen, who on July 2, 1942 will celebrate his seventy-ninth birthday. His career as a medical scientist has won him the admiration and the love of every one who knows him. The young men whom he has encouraged and stimulated are many in number.

The medical career of Ludvig Hektoen began with a job as druggist in a hospital, which became for him an inspiration to the

study of medicine. He graduated in 1887 from the College of Physicians and Surgeons in Chicago, then served as apothecary in the Illinois Eastern Hospital for the Insane and subsequently made first place in the examination for internship at the Cook County Hospital. In this capacity he came under the direct instruction of Christian Fenger and turned naturally to pathology for a career. He was made curator of the museum of Rush Medical College in 1889 and in 1891 became professor of general pathology in his alma mater. In 1892 he became professor of pathologic anatomy and in 1894 professor of morbid anatomy and director of the laboratory of normal and pathologic histology,

bacteriology and hygiene in Rush Medical College. From that time onward his career has been a series of new appointments and new obligations in every field of medical science and public work.

Dr. Hektoen has been pathologist to the Presbyterian Hospital and head of the department in the University of Chicago and of pathology of St. Luke's Hospital. He established in 1902 the John McCormick Institute for Infectious Diseases and became its director. In 1932 he was made a member of the National Advisory Health Council of the U. S. Public Health Service and later became chairman of the Advisory Committee of the National Cancer Institute. In April 1915 he became chairman of the Committee on Scientific Research of the American Medical Association, in which position

he has been instrumental in determining grants of funds for research carried on throughout the country. In 1916 Dr. Hektoen gave the Cutter Lecture of the Harvard University Medical School and received the honorary degree of Doctor of Science from the University of Wisconsin. He was president of the American Society for Experimental Pathology. He received in 1920 the honorary degree of Doctor of Laws from the University of Cincinnati. In 1924 he was chairman of the Division of Medical Sciences of the National Research Council and in the same year he was appointed consultant pathologist in the U. S. Public Health

Service. In 1926 he served again as chairman of the Division of Medical Sciences of the National Research Council. The Norwegian government gave him its most distinguished recognition, the Order of St. Olaf, in 1929.

Throughout much of his life Dr. Hektoen has been engaged in special work in the field of cancer, serving for many years as a member of the board of directors of the American Society for the Control of Cancer and also as a member of the board of directors and of the advisory board of the Chicago Tumor Institute. In his career, however, he has been interested in every phase of medical science. Essays on pathology have been interspersed with scientific research on bacteri-

ology, parasitology, immunology and cancer. He has maintained a personal and intense interest in medical history and in all problems of social organization which involve medical knowledge. The bibliography of his writings includes many hundreds of references but fails to include innumerable reviews, official documents and miscellaneous writings that give a true picture of the contribution that he has made. He has been editor of the *Journal of Infectious Diseases* since it was first established in 1904 and also editor of the *Archives of Pathology* since its first number in 1925. He has also been at various times editor of the *Proceedings of the Institute of Medicine of Chicago*, chairman of its board of governors and editor of the *Transactions of the Chicago Pathological Society*. A special issue of

LUDVIG HEKTOEN, M.D.  
AWARDED DISTINGUISHED SERVICE MEDAL

the *Archives of Pathology*, dedicated to him at the time of his seventy-fifth birthday, carried the names of more than a hundred physicians who have at one time or another come directly under his preceptorship or inspirational leadership

Last year as a native of Wisconsin, Dr Hektoen was awarded the Distinguished Service Award of the State Medical Society of Wisconsin The Distinguished Service Medal of the American Medical Association, the greatest token of distinction in science offered by the American Medical Association, comes to him as a recognition by this great body of the tremendous contribution that he has made When he was notified of this honor, Dr and Mrs Hektoen came at once to the place of the annual session in Atlantic City, the medal was conferred on him at the opening general meeting by Dr Fred Rankin, President of the Association

## Current Comment

### INTER-AMERICAN GUESTS IN ATLANTIC CITY

A significant feature of the 1942 annual session of the American Medical Association was the attendance of our guests from other American nations Hawaii, the Philippines and Puerto Rico were represented as constituent parts of the American Medical Association Indeed, the representative from the Philippines, Dr Benvenuto R Dino, had escaped from Corregidor to Mindanao with President Manuel Quezon in a submarine and had flown from Mindanao to Australia and then reached the United States with President Quezon aboard the *President Coolidge* From other parts of the world came 140 representatives, including 56 from Canada, 13 from Brazil, 11 from Cuba, 10 from Colombia, 9 from Argentina, 7 from Mexico, 7 from Chile, 5 from Venezuela and smaller numbers from Costa Rica, Peru, San Salvador, Haiti, Uruguay, Bolivia and Paraguay Guests were also in attendance from South Africa, Persia China, Greece and British Guiana Following is a list of the inter-American representatives who appeared on the scientific programs

#### SOUTH AMERICA

R David de Sanson, Rio de Janeiro, Brazil, Section on Laryngology, Otology and Rhinology

Luthero Vargas, Rio de Janeiro, Section on Orthopedic Surgery

Moacyr E Alvaro, São Paulo, Brazil, Section on Ophthalmology

Alejandro Lipschutz, Santiago de Chile, Section on Obstetrics and Gynecology

Jorge E Caveller, Bogota, Colombia, Section on Urology

Alberto Hurtado Lima, Peru, General Scientific Meetings and Section on Pathology and Physiology

#### MEXICO

Ignacio Chavez Mexico D F, General Scientific Meetings and Section on Experimental Medicine and Therapeutics

Francisco de P Miranda, Mexico D F, Section on Practice of Medicine

#### CUBA

Raimundo de Castro, Havana, Section on Miscellaneous Topics, Session on Legal Medicine

V Pardo Castello, Havana, Section on Dermatology and Syphilology

Enrique Saladrigas Zayas, Havana, General Scientific Meetings

#### PUERTO RICO

Enrique Koppisch, San Juan, General Scientific Meetings

#### CANADA

Wesley Bourne, Westmount, Que, Section on Anesthesiology  
John F McIntosh, Montreal, Que, General Scientific Meetings

George E Hall, Ottawa, Ont, General Scientific Meetings

D Y Solandt, Toronto, Ont, joint meeting of Section on Nervous and Mental Diseases and Section on Orthopedic Surgery

D E Staunton Wishart, Toronto, Ont, Section on Laryngology, Otology and Rhinology

Joseph A MacFarlane, Toronto, Ont, Section on Orthopedic Surgery

In subsequent issues of THE JOURNAL will appear many of these contributions and also some portraits and group pictures On June 10 the Board of Trustees and officers of the Association tendered a reception to all our inter-American visitors, which was a most pleasant occasion, serving to cement more fully the bonds of friendship initiated by this annual session Speaking as a representative of the inter-American group, one of their leaders urged that all future sessions of the American Medical Association feature the attendance of guests from inter-American countries He felt that times of peace would raise the number from 140 physicians who registered on this occasion to thousands THE JOURNAL here tenders to our inter-American guests the sincere appreciation of the American Medical Association for their cooperation at this time, when transportation made their attendance especially difficult Their contribution to the scientific programs, to many of the special meetings and occasions, and their congeniality were inspiring

### FOURTH OF JULY FIREWORKS INJURIES

From 1937 to 1941 inclusive the American Medical Association conducted annual summaries of injuries resulting from the celebration of the Fourth of July with fireworks The information summarized was obtained from questionnaires addressed to hospitals throughout the country The total number of injuries recorded in 1937 was 7,205 and in 1941 2,039, a significant reduction The number of deaths decreased from 20 in 1937 to 11 in 1941 Throughout this period THE JOURNAL has stressed the fact that adequate control of this unnecessary source of death and injury is dependent not only on adequate state legislation but on enforcement of existing laws as well This year a survey by the American Medical Association is not planned, but in the light of past experience it must be emphasized that neither legislative effort nor the work of enforcement agencies can be relaxed if a new rise in injuries and deaths is to be prevented Again THE JOURNAL cautions against any misguided sense of patriotism which might result in the increased use of fireworks on Independence Day 1942

### APPEALS COURT CONFIRMS DECISION OF DISTRICT OF COLUMBIA COURT

Announcement was made on June 15 that the United States Court of Appeals for the District of Columbia had affirmed the judgment of the lower court convicting the American Medical Association and the District of Columbia Medical Society. In accordance with the instructions of the House of Delegates and the Board of Trustees, attorneys of the American Medical Association propose, in effect, to appeal to the Supreme Court of the United States from the judgment of conviction.

### NEW OTORHINOLARYNGOLOGIC ABSTRACT JOURNAL

Under the chief editorship of Chevalier L. Jackson, the first issue of the *Quarterly Review of Otorhinolaryngology*, dated March 1942, has appeared. This abstract journal reproduces some illustrations, and the abstracts are arranged in systematic fashion under the main headings of Otology, Rhinology and Laryngology. Sections on Bronchology and Esophagology are to be included later. These main heads are further subdivided, and, at the end, in a section called General, articles covering more than one of the subdivisions are abstracted. The *Review* aims to cover not only the important journals published in the United States and Canada but also a carefully selected list of the leading publications of the Latin American countries.

### ANOTHER DIRECTORY SCHEME

Ingenuity leads to many an extraordinary plan for the making of money. To the secretary of a state medical board came a communication from the Dixie Letter Shop at Roanoke, Va., stating that the "shop" is preparing a mailing list of all physicians in the entire United States for the use of the United States government in addressing each of them, and requesting the secretary to mail at once a copy of the state roster of registered physicians, giving their names and addresses. Haste is urged, they want to commence addressing the government envelopes promptly on receipt of material from them. A postscript stated that the "shop" is endeavoring to secure an up to date list for use by the government, because the American Medical Directory, which came off the press in July 1940, is inadequate to meet the present emergency. Apparently the promoters never heard of the Directory Service, which continually brings up to date the latest edition of the American Medical Directory. Furthermore, they do not seem to be aware of the fact that the Directory is issued regularly and that this year's edition is in press. Furthermore, the National Roster of Scientific and Specialized Personnel has at present the latest addresses of all physicians in the United States, as a result of questionnaires which were recently mailed to all physicians by the government. What government agency requested this particular "shop" to prepare such a list? Since conservation of effort and materials is essential to defense, why need any one set up machinery for developing a new directory? State boards of licensure are hardly likely—at their own expense—to sup-

ply the Dixie Letter Shop with the lists requested. They ought to inquire "How come?" But perhaps the Dixie Letter Shop is just working on the old aphorism "It never hurts to ask, somebody might say 'Yes'."

### A CONTINUOUS HEALTH PROGRAM

Two fundamental difficulties—insecurity of tenure for competent health officers and political interference in public health work—constantly threaten health programs in many American communities. Racine, Wis., an industrial lake shore city of approximately seventy thousand population, has had its industrial ups and downs during the past twenty years, but throughout that time it has maintained an increasingly effective public health service. Its 1941 annual report<sup>1</sup> is a mimeographed statement with a printed cover, as distinguished from expensively printed reports featured elsewhere. Racine has had only two health officers in twenty years, the first resigned voluntarily to enter a larger field, and the second is serving his third consecutive term. There has been virtually no turnover in the personnel of the department, except as the result of voluntary resignation and deaths in service. Such continuity without political interference under four mayors makes for consistency of policy and for steady uninterrupted progress. Since 1927 the facilities and records of the city and its health work have been presented by the health officer in an effort to learn about shortcomings and to plan a program to meet demonstrated needs. During this time the city has been listed first in its class once and received honorable mention three times in the Interchamber Health Conservation Contest of the United States Chamber of Commerce in cooperation with the American Public Health Association. The latest citation was for 1941. In the Racine health program a high degree of cooperation has been developed between the medical profession and the public health department. Physicians have participated actively in immunization programs, large health programs and antepartum service. The medical society has steadily and consistently supported the health officer in his aims and has on occasion served him with constructive criticism. Racine has been rated by the American Public Health Association as one of three cities in the United States with the highest percentage of possible cases of measles and whooping cough reported. Eighty-five per cent of the expectant mothers of the community have been shown by surveys year after year to be under medical care by their own physicians not later than the sixth month of pregnancy. There is no antepartum clinic. Only four births in 1941 were attended by midwives and only thirty-nine did not occur in hospitals. The total number of births for 1941 was one thousand two hundred and sixty-three. The infant death rate was 27.5 per thousand living births. This report offers an indication of what can be done in a community which is not exceptionally privileged but which has put into its public health work the three essential ingredients of medical cooperation: security of tenure for competent personnel and minimum of political interference.

<sup>1</sup> City of Racine Department of Health Annual Report 1941, Racine, Wis.

# MEDICINE AND THE WAR

*In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medicine and the war, and such other information and announcements as will be useful to the medical profession*

## THE NAVY NEEDS PHYSICIANS

Qualified physicians may still apply for appointment in the United States Naval Reserve. Rear Admiral Ross T. McIntire states that the Navy needs many more physicians, especially the younger men. The physician has free choice at the present time of applying for service in either the Navy or the Army. If he desires to apply for service in the Navy, he should communicate with the director of Naval Officer Procurement in his naval district. The Bureau of Medicine and Surgery will be pleased to advise any physician of the address of his director of Naval Officer Procurement if the address cannot be obtained otherwise.

## STUDENTS MAY ENLIST AS ENSIGNS IN THE NAVAL RESERVE

The Navy has not completed its quota of ensigns, H-V (P), U S Naval Reserve (medical students and premedical students accepted for admission to the next convening class in medical colleges). The recruitment program for appointments in class H-V(P), U S N R, will be continued. Senior medical officers in various offices of Naval Officer Procurement will be pleased to cooperate with the deans of medical schools in aiding students to apply for appointment in this classification.

## TREATMENT OF LEWISITE BURNS OF THE EYE

Carefully controlled work conducted by the National Research Council indicates that the most effective treatment for lewisite burns of the eye is washing with large amounts of 2 per cent solution of sodium bicarbonate in water or with plain water, which should be carried out as soon as possible after exposure. This information from the Office of Civilian Defense, Washington, D C, is made available especially because a previous news release dated March 31 referred to the treatment of lewisite burns of the eye with hydrogen peroxide which has been found to be ineffective.

## SPECIAL TRAINING FOR MEDICAL OFFICERS

Fifty-two officers of the medical department of the U S Army graduated at the Medical Field Service School, Carlisle Barracks Pa. June 6 after a special one month of training for particular assignments in the medical battalions of new infantry divisions to which all of these officers have been assigned. In a short ceremony, Brig-Gen. Addison D. Davis, commanding general at Carlisle Barracks, awarded the diplomas. Three members of the class belong to the Medical Administrative Corps and forty-nine to the Medical Corps. The members of this class came from twenty-five states and the District of Columbia. A succeeding class of fifty-six members arrived at Carlisle Barracks June 13 to begin the special training.

## COURSES IN THE TREATMENT OF BURNS

The Committee on Postgraduate Education of the Medical Society of the District of Columbia during May sponsored a postgraduate course in the modern treatment of burns and the prevention and treatment of chemical casualties, to which all physicians in the District and nearby Maryland and Virginia were invited and for which there was no charge. The first lecture, on May 18, was by Comdr. E. Harvey Cushing, M C, U S N R, and formerly of the faculty of medicine at Western

Reserve University and special observer in England for the U S Navy. The second lecture, May 25, was by Dr. Leon Goldman, assistant professor of dermatology, University of Cincinnati College of Medicine, and consultant in chemical warfare in the Office of Civilian Defense.

## COURSES IN CHEMICAL WARFARE IN LOS ANGELES

The Office of Civilian Defense in Washington, D C, sent instructors and necessary equipment to Los Angeles to present a three day intensive course on medical aspects of chemical warfare, beginning June 5. The first day's instruction was given in the Auditorium of the Los Angeles County General Hospital and the following two days' instruction at the Los Angeles County Medical Building, 1925 Wilshire Boulevard. On account of limited space, the attendance on the first day was limited to seventy-five physicians and on the last two days to two hundred physicians. The instruction was under the direction of Dr. W. L. Mould of the Office of Civilian Defense in Washington, D C. The course was offered to physicians in the southern California area who were willing to teach the subject in their own communities.

## VOLUNTEERS ENROLLED FOR CIVILIAN DEFENSE

At the first conference on May 29 with assistant regional directors in Washington since the organization of the Citizens Service Corps, Jonathan Daniels, assistant director of the Office of Civilian Defense in charge of civilian mobilization, reported that more than nine million volunteers are now enrolled for civilian defense work, including both the protective services and community activity. About nine thousand five hundred local defense councils are now organized, which is an increase of more than five hundred since March 1, and the number of volunteer offices, some of which serve as many as five local defense councils, has risen since March 1 from 1,950 to 2,403. Mr. Daniels said that our people recognize the urgency of mustering all our forces for a maximum civilian effort in war and they are asking 'How can I help?' The machinery of organization necessary to transmit and apply this human energy where it is most needed, he said, is ready and moving.

## BLOOD PLASMA RESERVES

The Illinois State Department of Health, according to the Chicago Sun, is establishing statewide registry of blood types in connection with its collection of blood plasma for possible disaster victims. The plasma has been collected in downstate areas by a mobile unit and shipped to Chicago for processing.

The Racine County (Wis.) Medical Society is active in the formation of a blood bank in Racine for which \$2,000 for equipment was recently donated by various citizens. Two Racine hospitals will serve as collecting stations.

The State Board of Health of Florida sent a trailer to Palatka, May 13-14, to collect human blood for processing. According to the Jacksonville Times-Union, the state board sends the blood to a central laboratory for processing and then returns the plasma to the counties in which it was gathered. In this way hospitals will have plasma on hand while awaiting the completion of the central blood bank at Orlando.

Equipment has been obtained for a blood bank to be operated in St. Elizabeth's Hospital, Yakima, Wash., which will be able to provide sufficient plasma for use in the Yakima Valley.

## CIVILIAN DEFENSE EQUIPMENT

One thousand six hundred first aid belts with supplies to fill them provided from state funds have been received by the civilian defense organization at New Bedford, Mass. Ambulance equipment has been received, also \$2,000 worth of medical supplies paid for by the New Bedford Defense and Health Corps, Inc. One thousand persons have enrolled to serve at fifteen medical assembly points, two hundred stretchers are available and more are being manufactured and paid for by the city. The medical division has a complete list of all medical supplies in the local drug stores, and the defense committee has received promise of delivery of supplies for twenty-two medical teams and eleven casualty stations. These preparations are distinct from the Red Cross preparations, which have provided well for disaster relief.

The Indiana Funeral Directors' Association, according to the *Indianapolis News*, in case of emergency can supply eight hundred and seventy ambulances and two thousand, five hundred and fifty-seven men to the proper authorities. In addition, two hundred and fifty-five additional cars can be made available by the association, twenty-four inhalators, six hundred and twenty-five stretchers and three hundred and seventy-five flares and flags. This equipment has already been listed with the defense council and with the director of the Indiana Department of Public Safety. Three hundred and eighty of these ambulances are already equipped for first aid.

San Antonio, Texas, has set up emergency first aid hospitalization stations with eight hundred and seventy-four beds, and six hundred and fifty additional beds have been installed in the local regular hospitals.

Four hundred stretchers were made in WPA shops in San Diego, Calif., and delivered on May 10 to the Emergency Medical Service of the Office of Civilian Defense. Members of the National Youth Administration helped in cutting the lumber, women of the WPA shaped and stitched the canvas, while men in furniture repair shops finished the stretchers by assembling and painting the frames and attaching the covers.

## CORPS AREA SURGEONS CONFER WITH SURGEON GENERAL

U S army corps area surgeons and the surgeons of the four field armies have just concluded in Washington a four day conference with Major Gen James C Magee, Surgeon General of the Army, the War Department announced on May 28. The army surgeons discussed administrative problems and uniformity of procedure. The following Medical Corps officers attended the conference:

First Army Col Raymond W Bliss, Fort Jay, N Y  
Second Army Col Frank H Dixon, Memphis, Tenn  
Third Army Col John Dibble, San Antonio Texas  
Fourth Army Col Condon C McCornack, San Francisco  
First Corps Area, Boston Col J J Reddy  
Second Corps Area Governors Island N Y Col Charles M Watson  
Third Corps Area, Baltimore Col Robert C McDonald  
Fourth Corps Area, Atlanta, Ga Col Sanford W French  
Fifth Corps Area, Fort Hayes, Ohio Col Edgar C Jones  
Sixth Corps Area, Chicago Col Joseph E Bastion  
Seventh Corps Area, Omaha Col Herbert C Gibner  
Eighth Corps Area, Fort Sam Houston, Texas Col W Lee Hart  
Ninth Corps Area, Fort Douglas, Utah Col Harry R Beery

## VENEREAL DISEASE CONTROL OFFICERS

The U S Army has appointed the following venereal disease control officers in areas designated in its effort to forward a comprehensive program to reduce loss of army strength through venereal diseases:

Capt Lyman C Duryea, New York, to headquarters second corps area, Governors Island, New York  
Capt Albert F Doyle, Johnstown, Pa., to headquarters third corps area, Baltimore  
Major William A Brumfield Jr, Albany, N Y, to headquarters fourth corps area, Atlanta Ga  
Capt Ernest B Howard, Boston, to headquarters seventh corps area, Omaha  
Capt Wayne W C Sims Seattle, to headquarters ninth corps area Fort Douglas, Utah

HOSPITAL UNIT PRACTICES  
MOBILIZATION

Everett, Wash., has two mobile defense hospital units, each complete with a twenty-five bed hospital and a surgery which can be moved about and set up quickly. To each surgery is assigned two surgeons, six nurses and two anesthetists, while the hospital portion of the unit has two nurses, eight nurses' aides and several first aid workers. With each hospital unit are two emergency ambulance units, to each of which are assigned five women trained in first aid, and a driver. One of Everett's mobile defense hospital units held a practice mobilization May 10.

ORDNANCE INDUSTRIAL HYGIENE  
SURVEYS

A number of additional war plants have just been certified for industrial hygiene survey by the Office of the Chief of Ordnance, War Department, making a total of one hundred and forty-three establishments turned over to the Division of Industrial Hygiene, National Institute of Health, to date.

Three crews are continuing the ordnance survey work of the division.

Passed Assistant Sanitary Engineer (R) H E Seifert has been assigned to the Office of the Chief of Ordnance for the purpose of effecting a closer liaison between the Ordnance Department and the Division of Industrial Hygiene, National Institute of Health, in their cooperative program of inspection of government owned plants.

## AVIATION MEDICAL EXAMINERS

A routine course of instruction to qualify medical officers for duty as aviation medical examiners began at the School of Aviation Medicine, Randolph Field, Texas, on May 18 and will continue until August 15. Following is a list of the officers enrolled:

|                                      |                                    |
|--------------------------------------|------------------------------------|
| Atkinson, Robert H., 1st Lieut       | Koehne, Frederick D., 1st Lieut    |
| Axelrod, Bernard, 1st Lieut          | Lamb, Francis D., 1st Lieut        |
| Bigler, Ivan E., 1st Lieut           | Lamb, Richard R., 1st Lieut        |
| Boothby, Carl F., 1st Lieut          | Lame, Louis A., Captain            |
| Borkon, Maurice, 1st Lieut           | Large, John S., Captain            |
| Boyd, Eugene J., 1st Lieut           | Lim, Kwong, 1st Lieut              |
| Bruno, Nicholas J., Captain          | Lucido, Joseph L., Captain         |
| Burchell, Howard B., 1st Lieut       | McBrearty, J D., 1st Lieut         |
| Cadranel, Joseph L., 1st Lieut       | McRae, James H., 1st Lieut         |
| Capriotti, Octavius A., 1st Lieut    | Magholo, Andrew J., Jr., Captain   |
| Chechule, Dominic T., 1st Lieut      | Matsko Stephen E., 1st Lieut       |
| Chinn, Silas, 1st Lieut              | Matzner, Irving A., 1st Lieut      |
| Clark, Benjamin P., Captain          | Mead, James G., 1st Lieut          |
| Cleland, Charles E., Jr., Major      | Michael Clifford Major             |
| Cross, Merrill M., Captain           | Mills Clifford W., 1st Lieut       |
| Decker, Charles E., 1st Lieut        | Moore, Carl L., 1st Lieut          |
| De Fries, William A., 1st Lieut      | Mounce Chanceford A., Captain      |
| Dickerman, Frederick A., 1st Lieut   | Moyer, Forrest G., Captain         |
| Dickerman, Henry S., Jr., 1st Lieut  | Mulmed, Earl I., 1st Lieut         |
| Donich, George M., Captain           | Murphy, George E., 1st Lieut       |
| Doughtie, Jack L., Captain           | Neighbors, Joseph B., Jr., Captain |
| Downing, John S., 1st Lieut          | Nuttall, James B., Captain         |
| Dutlinger, Robert P., 1st Lieut      | O'Connor, Michael J., Captain      |
| Ellis, Fred A., 1st Lieut            | Park, Charles L., 1st Lieut        |
| Espinoza, David V., 1st Lieut        | Patterson, Fred L., Jr., 1st Lieut |
| Essrig, Irving M., Captain           | Pelton, Bernard I., Captain        |
| Ettman, Irving K., 1st Lieut         | Petrolas, John D., Captain         |
| Fogel, David H., 1st Lieut           | Poore, Alfred M., 1st Lieut        |
| Franzoni, Andrew E., Captain         | Reis, Paul B., Captain             |
| Friedman, Harold S., 1st Lieut       | Reisman, Samuel G., Captain        |
| Gallagher, Edward J., 1st Lieut      | Rest, David, 1st Lieut             |
| Gans, Paul J., Captain               | Rider, Thomas L., 1st Lieut        |
| Giardina, Jacob J., Captain          | Ruffin, Marshall De G., 1st Lieut  |
| Glasscock, James R., Captain         | Schow, Floyd W., Captain           |
| Green, Daniel M., Captain            | Schroeder, Herman J., 1st Lieut    |
| Green, George B., Captain            | Schultz, Samuel K., Major          |
| Greenwood, Robert C., 1st Lieut      | Schutz, Sigmund, 1st Lieut         |
| Groth, Norton R., Captain            | Schwartz, Simon D., Captain        |
| Halford, Richard F., 1st Lieut       | Scott, Wirt S., Jr., 1st Lieut     |
| Hammerel, John J., 1st Lieut         | Shields, Thomas S., Captain        |
| Hanson, Martin F., Captain           | Silver, Michael W., 1st Lieut      |
| Harms, Albert C., 1st Lieut          | Simons, Stanley J., Captain        |
| Hellweg, Charles E., Captain         | Smith, James J., 1st Lieut         |
| Hitchko, Michael J., 1st Lieut       | Spoeneman, Marlin C., Captain      |
| Jennings, Lawrence S., Captain       | Sposato, Emil, Captain             |
| Jensen, Marshall N., Major           | Stem, William A., 1st Lieut        |
| Johnson, Benjamin H., Jr., 1st Lieut | Tichenor, Clifford J., Captain     |
| Johnson, Lowell R., 1st Lieut        | Trockman, Richard J., 1st Lieut    |
| Jones, William F., 1st Lieut         | Wall, Edward C., Captain           |
| Kaplan, Louis G., 1st Lieut          | Wallace, Henry G., Captain         |
| Kaplan, Morris, 1st Lieut            | Winkler, Henry J., 1st Lieut       |
| Keller, George H., Captain           | Yavaro, Mully, 1st Lieut           |

# ORGANIZATION SECTION

---

## PROCEEDINGS OF THE ATLANTIC CITY SESSION

---

MINUTES OF THE NINETYTHIRD ANNUAL SESSION OF THE AMERICAN MEDICAL ASSOCIATION, HELD IN ATLANTIC CITY, JUNE 8-12, 1942

---

### HOUSE OF DELEGATES

---

#### *First Meeting—Monday Morning, June 8*

The House of Delegates convened in the American Room of the Hotel Traymore and was called to order at 10:15 a. m. by the Speaker, Dr. H. H. Shoulders.

#### *Preliminary Report of the Reference Committee on Credentials*

A preliminary report of the Reference Committee on Credentials was submitted by the chairman, Dr. J. Newton Hunsberger, Pennsylvania, who reported that about one hundred and thirty-five delegates with proper credentials had registered.

#### *Roll Call*

The Secretary called the roll and, after a supplementary report from the Reference Committee on Credentials regarding alternate delegates, announced that a quorum was present.

#### *Adoption of Minutes of Cleveland Session*

On motion of Dr. E. G. Wood, Tennessee, seconded by Dr. John Z. Brown, Utah, and carried, the House dispensed with the reading of the minutes and adopted the minutes as published and circulated.

#### *Distinguished Service Award*

Dr. Roger I. Lee, Acting Chairman of the Board of Trustees, stated that the Board regretted that Dr. Arthur W. Booth, Chairman of the Board of Trustees, was unable to attend the annual session because of illness and then presented the following report:

The Committee on Distinguished Service Awards of the American Medical Association submitted five names to the Board of Trustees.

In accordance with chapter VI, section 5 of the By-Laws, the Board has selected by ballot the following names for presentation to the House of Delegates in alphabetical order, and presents a brief statement concerning each of them:

Dr. George W. Crile is distinguished as a surgeon, a scientific investigator and a leader. He has been chairman of the board of regents of the American College of Surgeons, has introduced new procedures of importance in surgical science and is the author of several books.

Dr. Ludvig Hektoen has been for many years distinguished as a leader in the field of pathology. He is chairman of the advisory committee of the National Cancer Institute and is chairman of the Committee on Scientific Research of the American Medical Association. He has been chief editor of the *ARCHIVES OF PATHOLOGY* from its inception and is editor of the *Journal of Infectious Diseases*. He was director of the McCormick Institute for Infectious Diseases and has contributed much important research in the fields of infectious diseases and preventive medicine. He was for many years professor of pathology at the Rush Medical College and is now emeritus professor. Last year he was awarded the Distinguished Service Award of the State Medical Society of Wisconsin.

Dr. Elliott P. Joslin is known throughout the world for his contributions to our knowledge of diabetes and for his educa-

tional contributions in this field for both the medical profession and the public. He has participated in graduate education and is the author of several books of distinction.

The Speaker appointed as tellers Drs. J. Q. Graves, Louisiana, George W. Kosmak, New York, George P. Johnston, Wyoming, Lowell S. Goin, California, and H. G. Hamer, Indiana.

The tellers spread the ballot, and the Secretary announced that one hundred and forty-one votes had been cast, of which Dr. Hektoen received fifty-eight, Dr. Crile fifty-five and Dr. Joslin twenty-eight.

The Speaker announced that no nominee had received a majority of the ballot cast and that the Chair would rule that the name of Dr. Joslin be dropped and that the members of the House would prepare their ballots on Drs. Crile and Hektoen.

The tellers spread the ballot, and the Secretary announced that one hundred and forty votes had been cast, of which Dr. Hektoen received seventy-six and Dr. Crile sixty-four.

The Speaker declared Dr. Ludvig Hektoen, who had received a majority of the votes cast, to be elected by the House to receive the Distinguished Service Award of the American Medical Association.

#### *Address of the Speaker, Dr. H. H. Shoulders*

The Vice Speaker, Dr. R. W. Fouts, Omaha, presided while the Speaker, Dr. H. H. Shoulders, read his address, which was referred to the Reference Committee on Reports of Officers. *Mr. Speaker, Members of the House of Delegates and Guests:*

This is the fifth session of the House of Delegates over which it has been my privilege to preside as your Speaker—an honor for which I have an increasing sense of gratitude.

Many important events have taken place in the world since we met a year ago. The one event of transcendent importance to all of us is the entrance of the United States into the World War. We are told that the purpose of this war effort is to preserve our American way of life. Certainly no more laudable purpose could inspire a people or a nation to effort and to sacrifice. No one has defined precisely what is meant by the expression our American way of life, yet we all sense its meaning. Its principal attribute concerns freedom in all its forms. We know that this attribute distinguishes it from the way of life in most other countries and nations. We know that it was conceived, established and vouchsafed to us by the vision, the wisdom and the sacrifice of our forefathers. We recognize that its record of achievement in human welfare and happiness is without a parallel in human history. We now know also that, if it is to survive in the world, its preservation is the particular task of this generation. The thought that this way of life could and might be lost has been impressed on the people of this nation with tremendous force within the last year. This terrible thought seems to have had the effect of stimulating in all of us a much higher appreciation of its value as well as an appreciation of the tragic consequences which would follow its destruction. This way of life has been assailed in several different ways in recent years and the House of Delegates has made a record in its defense which it seems to me is worth brief review at this time.

Four years ago (1938) we met in extraordinary session to consider actions which should be taken with reference to an emergency situation. That situation arose from an attempt that was being made to develop in this country a new and alien form of medical practice. The proposal, as you know, had its real origin and development in an absolute monarchy which, by a process of transition, has been converted into a totalitarian state. You gave serious consideration to the proposal and reached the conclusion that it contained the elements of possible threat to our American way of life. You expressed a conviction then that the freedoms embraced in our methods of delivering medical care are an essential part of our American way of life and have an importance equal to that of other freedoms embraced in it. You therefore took action to oppose the adoption of the proposal.

Similar attempts have recurred in different forms and under different types of leadership in the years that have passed since 1938. In each instance your reactions to them have been the same. In 1940 it was suggested that our nation might be threatened by a military force and that it would be prudent and patriotic for the House to take action looking to the creation of a state of medical military preparedness. You took such action then with results which are known to all. Time proved that foresight to have been justified. War did come eighteen months later and in such a way as to subject our nation to the gravest threat it has ever faced.

At first glance a similarity between these several threats is not apparent. Careful observation, however, brings out a definite similarity among all of them. It is true that the approach of each was different, the persons involved were different and the methods employed were and are different. They are similar in the sense that each has constituted a threat of more or less magnitude to the fundamental freedoms in our American way of life. The actions of the House of Delegates on these several occasions have been entirely consistent. Each attack, regardless of its form, has met your active opposition. When the proposals were political in nature and appeared to be limited in scope to the field of medical care, you took action in opposition to their adoption. When the military threat appeared as nothing more than a glimmer on a distant horizon, you took action as patriotic American citizens to defend the whole of our way of life. I shall not attempt to review in any detail the several actions you have taken. This much must be said, however, the several actions you have taken are consistent with one another. They are consistent also with an attitude of loyal devotion to all these freedoms which constitute the basic elements in our way of life. You have used with prudence the powers you possessed in the most effective manner you could use them. When the expression of a profound conviction by resolution was the only weapon at your disposal, you expressed it by unanimous action.

In this tragic hour it seems to me that you can look back on the record you have made in this brief period and on this vital issue with a justifiable sense of pride and satisfaction. We are all called on to surrender for the period of this emergency some of the freedoms to which we are accustomed. We do this willingly and wholeheartedly, not because we have abandoned them, but for the purpose of making more effective the national effort in their defense and to the end that they will be made secure forever. It has been said that genuine religion and genuine patriotism find their highest forms of expression in sacrifice. As far as I am concerned, that philosophy is true. Certainly words and beautiful phrases can be and have often been used to deceive. The deceptive use of words by political leaders and agitators obviously is responsible for the tragic state of the world today. Willing sacrifice for the preservation of a principle is the most dependable test of devotion to it. By such a test your loyalty to our American way of life has been proved. It seems to me that that record is altogether sufficient to give to the American people—to soldiers and to the mothers and fathers of soldiers—the highest form and the fullest measure of assurance as to what you and the profession you represent can be depended on to do today, tomorrow and until victory has been won.

In Memoriam

In accordance with the established custom of the House of Delegates of taking official notice of the death of Fellows who have served the Association in official capacities, either as members of the House or as officers of the Association, the Speaker called the roll of those who had passed away since the House met in June of 1941, as follows:

- (The dates following the names indicate years of service in the House or as officers of the Association.)
- James N. Baker, Alabama 1930-33, 1935-41
  - William Hemphill Bell, U. S. Navy, 1907
  - Edmund R. Brush, Ohio, 1926-28, 1930-31, 1934-35, 1938-41
  - Robert C. Bryan, Virginia, 1919
  - Charles A. Dukes, California, 1933-38, 1940 Vice President 1941-42
  - William A. Ellingwood, Maine, 1934-41
  - William J. Frick, Missouri, 1916-17
  - Henry D. Furniss, New York, 1913
  - T. W. Gillespie, Illinois, 1925
  - Schuyler Colfax Graves, Michigan, 1909
  - George A. Hendon, Kentucky, 1928-31
  - S. W. Johnston, Mississippi, 1924-26
  - Eugene S. Kilgore, California, 1920
  - Bransford Lewis, Missouri, 1913
  - Dean Lewis, Baltimore, Maryland Section on Surgery, General and Abdominal, 1915-17 President Elect 1932-33, President 1933-34
  - William D. Martin, Pennsylvania, 1919
  - Charles H. McCully, Indiana, 1910
  - William Neil McDonnell, U. S. Navy, 1922, 1932
  - John J. McLoone, Arizona, 1916
  - S. K. Morrison, Nevada, 1924
  - Howard Morrow, San Francisco, California Vice President 1938-39
  - William H. Myers, Georgia, 1929-41
  - Juan C. Nanagas, Philippine Islands, 1921
  - Charles S. Skaggs, Illinois, 1928-38
  - Rock Sleyster, Wisconsin, 1913-14 1918-26, Vice Speaker House of Delegates 1922-26, Trustee 1926-37, President Elect 1938-39, President 1939-40
  - Charles H. Stoddard, Wisconsin, 1916
  - Terry M. Townsend, New York 1929, 1935-38, 1941
  - R. H. Walker, West Virginia, 1932
  - Cisey A. Wood, Pasadena, California Section on Ophthalmology 1904
  - Ross A. Woolsey, Missouri, 1923

On motion, duly seconded and carried, the delegates arose and stood in silent tribute to the memory of the deceased delegates and officers.

Reference Committees

The Speaker, before announcing the personnel of the Reference Committees, asked and received permission to name two additional reference committees, namely the Reference Committee on Executive Session and the Reference Committee on Military Preparedness. The personnel of the Reference Committees as appointed by the Speaker is as follows:

SECTIONS AND SECTION WORK

- Arthur T. McCormack, Chairman Kentucky
- L. G. Christian Michigan
- Oliver H. Weaver Georgia
- B. F. Cook Vermont
- Arthur J. Bedell Section on Ophthalmology

RULES AND ORDER OF BUSINESS

- Thomas T. Thornton, Chairman Iowa
- A. A. Walker Alabama
- E. N. Roberts Idaho
- T. J. Savage Minnesota
- John Z. Brown Utah

MEDICAL EDUCATION

- Walter G. Plippen, Chairman Massachusetts
- James R. Miller Connecticut
- Edward H. Skinner Section on Radiology Louisiana
- L. J. Menville Minnesota
- A. W. Adson

LEGISLATION AND PUBLIC RELATIONS

- E. S. Hamilton, Chairman Illinois
- Don F. Cameron Indiana
- Stephen E. Gavin Wisconsin
- Henry A. Luce Michigan
- Carl R. Steinke Ohio

HYGIENE AND PUBLIC HEALTH

- Felix J. Underwood, Chairman U. S. Public Health Service
- W. F. Draper Texas
- Holman Taylor Pennsylvania
- Robert L. Anderson Kentucky
- F. S. Crockett

## AMENDMENTS TO CONSTITUTION AND BY LAWS

|                         |                       |
|-------------------------|-----------------------|
| Walter E. Vest Chairman | West Virginia         |
| Edward M. Pillette Sr   | California            |
| Walter I. Donaldson     | Pennsylvania          |
| Karl S. I. Hohlen       | Nebraska              |
| William Weston          | Section on Pediatrics |

## REPORTS OF OFFICERS

|                           |                |
|---------------------------|----------------|
| Deering G. Smith Chairman | New Hampshire  |
| Edward C. Podvin          | New York       |
| Thomas A. Pitts           | South Carolina |
| J. H. Irwin               | Montana        |
| Mercedith Mallory         | Florida        |

## REPORTS OF BOARD OF TRUSTEES AND SECRETARY

|                         |            |
|-------------------------|------------|
| Louis H. Bauer Chairman | New York   |
| Parke G. Smith          | Ohio       |
| J. F. Hassig            | Kansas     |
| William R. Molony Sr    | California |
| A. R. McComas           | Missouri   |

## CREDENTIALS

|                              |              |
|------------------------------|--------------|
| J. Newton Hunberger Chairman | Pennsylvania |
| G. Henry Mundt               | Illinois     |
| H. B. Everett                | Tennessee    |
| Thomas M. Brennan            | New York     |

## MISCELLANEOUS BUSINESS

|                                |                      |
|--------------------------------|----------------------|
| Charles G. Strickland Chairman | Pennsylvania         |
| J. T. Donovan                  | New York             |
| H. C. Macatee                  | District of Columbia |
| Andrew F. McBride              | New Jersey           |

| J. Q. Graves       | Louisiana  |
| George W. Kosmak   | New York   |
| George P. Johnston | Wyoming    |
| Lowell S. Goin     | California |
| H. G. Hamer        | Indiana    |

## Address of President Frank H. Lahey

The Speaker resumed the chair and presented the President Dr. Frank H. Lahey, Boston who delivered the following address which was referred to the Reference Committee on Reports of Officers

*Mr. Speaker and Members of the House of Delegates*

It is my desire to express in my first statement my appreciation of the willingness of the Association and its officers to permit me to employ for war work a large part of the time which under less unusual conditions would have been employed in organization interests of the American Medical Association. Whenever I have sought advice concerning my responsibility to the Association and to the national government, the reply from your officers and your headquarters has been unhesitating unequivocal and unselfish. It has been that I was to be at complete liberty to neglect any presidential duties to whatever degree I deemed the immediate needs of the emergency demanded.

It would be impossible for me to tell you what an aid and comfort the Secretary and the Editor of the Association have been to me with their years of experience. The generous donation of this experience and their advice has been of such assistance as to aid me immeasurably in the conduct of my duties. I am sure also that they have protected me from mistakes which would have complicated my position not considerably.

While I have known the Trustees, the Council members, most of the members of the House of Delegates and other officers of the Association in the past, the closer contacts which I have had over the two years I have been in office as President-Elect and President have given me the opportunity to know them even better and to appreciate even more the time and effort they devote to the Association. Hours spent with the Board of Trustees have opened my eyes to the magnitude and seriousness of their assignments. Critical and intimate participation in the deliberations of your financial committee have impressed me with the care and caution exercised in the management and investment of your funds. I very much doubt that there exists a record in management of trust funds better than that made by your capable secretary, treasurer and financial committee. I do not believe that it will ever be possible for individuals in medicine to realize how seriously these men devote themselves to these positions or to appreciate fully where medicine, medical education and hospital practice would be today without this unselfish devotion to what literally amounts to a cause.

To visit the various state, county and special societies has, because of their generous hospitality and friendliness, been no hardship but a real pleasure. In view of the apprehension concerning the effects of the presidency of the American Medical Association on the health of those who occupy it, I would say that, having the personal experience which I have had with the duties of the office, I believe that it is possible, with intelligent planning and the cooperation which one receives from every one to complete these two years spent as President-Elect and President of the American Medical Association in better health than that with which one starts the service. These travels have, in addition, in these unusual times provided for me the opportunity to preach the gospel of realistic awareness and aggressive preparedness. Perhaps in some measure because of the unavoidable prominence which the position of President of the American Medical Association carries with it, it has resulted in my being nominated by the President of the United States together with Harvey Stone, C. Willard Camahner, James E. Paullin and Harold S. Diehl to the Committee on Procurement and Assignment as one of the representatives of American medicine to participate in national war activities. For this assignment I am deeply grateful as are I know the other members of the board. Without this assignment we all realize that at our age we might well be, as are so many other doctors of similar age at this time consumed with a patriotic desire to serve the country but at least as yet unavoidably without opportunity to do so. I know that I can speak for this board, while not appointed by but nevertheless representative of the American Medical Association, when I say that it appreciates gratefully its good fortune in being selected and the privilege of having the opportunity to represent American medicine in this undertaking and that it is conscious of the fact that the honor and good name of American medicine are at stake in how well and intelligently American medicine cares not only for the armed forces and associated federal agencies but also for the civilian population, industry, hospitals and medical schools in the present and coming emergency. It is my sincere conviction that when this difficult ordeal for our country and its citizens is successfully terminated as you and I know it eventually will be, and viewed in retrospect, the fact that medicine had so intelligently and forehandedly organized itself in the American Medical Association will be revealed to even doubting minds as a most important factor in contributing to this successful outcome.

May I say one more word since I wrote this and as I travel the country—and I would I believe not be in my character if I did not preach a little—it is my definite conviction that while industry and many other sections of the country are accurately and realistically aware of the situation the country is still in an undue state of optimism. If we could but preach to this country and to the doctors—and this comes to me not only in a general way but in my position as chairman of the Board of Procurement and Assignment and relates itself to the number of doctors who have responded—and if the country could but realize that the successful approach to

this emergency is not believing what is pleasant, because that is unlikely to be true, but believing what is unpleasant, because that is likely to be true, we would come nearer bringing this to a successful outcome sooner than we shall under the pleasant plan of believing pleasant things instead of unpleasant things. That is a little complicated, but nevertheless it really means that I believe that medicine in the country at large is still not facing the facts as frankly as it should, and I believe that we as leaders in this country can go out and still do a good deal to preach this gospel, that optimism is one of the things which can lead to our downfall. We do not suffer from the urgency of the situation that the Japs or the Germans do. They must win or die. There is no urge like that of necessity, and it is my definite opinion that this country is still not convinced that its situation is one of urgent necessity.

#### Address of President-Elect Fred W. Rankin

The Speaker presented the President-Elect, Dr. Fred W. Rankin, Lexington, Ky., who delivered the following address, which was referred to the Reference Committee on Reports of Officers.

#### *Mr. Speaker and Members of the House of Delegates*

Custom dictates that the President-Elect address the House of Delegates at the first meeting of the annual session. This is a good custom for it permits him to give an account of his stewardship and to record observations gleaned in his travels throughout the country during the past year. In addition, he may offer any suggestions which seem pertinent.

Today's world events, perhaps dimly visualized at the last session of the American Medical Association, have so engulfed our nation that we have but one business now—the business of war. All our efforts are focused on this one objective, and everything associated with our professional lives is directly or indirectly concerned with war problems.

When I began to travel around the country last summer and autumn, visiting various state medical societies and other medical units, an entirely different atmosphere prevailed than now exists and the sentiment of the country as a whole, and physicians as a class, was distinctly divided on the question of our active participation in the struggle. Every one accepted either graciously or grudgingly the necessity of a program of preparedness, but only a small percentage of the people subscribed with hearty enthusiasm to any idea of immediate participation in hostilities. This sentiment, it seemed to me, varied considerably in different parts of the country, depending largely on geographic location. Following the opening of an undeclared war by Japan, sentiment immediately changed, unity appeared and the entire citizenry aligned itself wholeheartedly in cooperation with the Allied Nations in war effort. It is unnecessary for me to recall to you in detail the steps which have been pursued by the American Medical Association in planning a distribution of doctors, with proper allocation to the armed forces and without dislocation of civil practice beyond a reasonable degree.

Circularization of the profession by questionnaire and subsequent evaluation of the professional capacities of each individual physician by state committees accumulated enormous amounts of data which have subsequently been made available to the Surgeon Generals of the Army and the Navy. These questionnaires were answered by each one of you. Immediate use of the data furnished by these questionnaires was extremely advantageous, for after war was declared the medical profession found itself more forward in its war efforts than other groups. Immediately there was established in Washington an agency called the Procurement and Assignment Service, whose duty it is to supervise the selection and allocation of the entire profession on a voluntary basis. This agency has functioned from its inception with enthusiasm but not without perplexities. The rapid expansion of the medical services of the Army has at times almost overwhelmed it because of lack of personnel and funds, difficulties which seemed almost insurmountable. Each one of you has taken part in the effort of your state, district or county to make the program of the Procurement and Assignment Service a success. That is as it should be, for the medical profession is charged with running its own program. I have no knowledge of any other group to which the

Administration has given this privilege, and it is essential that our constituted agencies be supported vigorously to the end that the war effort be properly and successfully prosecuted.

To admit that we have made some mistakes and that accomplishment has not been 100 per cent adequate up to the present time is not an unworthy confession. We have made mistakes, but they have been honest mistakes which have been the result of confusion and circumstances for which the profession has been only partly responsible. Nevertheless the fact remains that we do share a distinct responsibility for the fact that a sufficient number of physicians of proper age and capacity to care for the rapidly increasing needs of an expanding army has not been immediately forthcoming. The number of volunteers to the Procurement and Assignment Service, including physicians of all ages, as of May 1 was less than thirty-five thousand of the whole medical profession. An accelerated recruitment program which cuts all "red tape" and approaches physicians directly has stimulated the profession to more prompt action. This decentralization of the program and emphasis on state efforts has been productive of encouraging results, and I have no doubt that adequate numbers of medical men will thereby be made available. I believe that you will agree with me that it is our duty as members of the medical profession to stand back of the Procurement and Assignment Service in our capacities as individual physicians and representatives of state or corps area units. This agency must function, for, in a war such as we are engaged in, total effort is not too much.

We must understand that this is a war of survival. We must understand that we fight with unscrupulous brutal enemies in a conflict whose technique by reason of motorized and mechanized equipment of warfare is not only an entirely new technique but one of savagery employed against both armed forces and civilian populations. We must recognize that this new warfare has speeded up the tempo of action to the point where only those with the stamina of vigorous youth can practice it. This is a war of young men. Older physicians, many of whom served in the last war, have in large numbers signified their desire to offer their services again, but obviously they can be utilized in many other positions more advantageously than with the armed forces. Is it not, then, an admirable duty of the older men to encourage physicians of the proper age to enter military service? The places of these younger men, both in civil practice and in the teaching institutions, must be taken by members of the medical profession who are physically disqualified for service or who are beyond the age limit for active duty.

Army authorities, recognizing the need for young men, have ruled that men over 56 years of age may not serve with troops. Furthermore, the Army has recognized the great necessity for the utilization of professional specialists in their particular fields. Guided by the advice of committees of many medical organizations, the Surgeon General's Office is attempting to place round pegs in round holes, thus not only increasing the efficiency of our professional efforts but avoiding many of the pitfalls which the hurried expansion of World War I brought about. I can testify heartily to the enthusiastic reception which my efforts have received in the Surgeon General's Office and I feel confident that I am speaking for my colleagues from civil life who are on duty there with me.

As we proceed with our war duties, and each one of us whether in uniform or not is in this war and on duty, we must recognize that furnishing medical men to the armed forces and to the civilian population connotes a continuing supply of medical men, and I hope that that supply may be continued under present day standards of medical education, even including completion of an intern year. Whether such standards will have to be revised in the future is a problem to be answered only by the changing tactical situation. Certainly it should be recognized that the supply of physicians to the armed forces and for civil practice can be continued only by maintaining and increasing the production of physicians. That many of the medical schools have already contributed affiliated units or sent a percentage of their faculties to the Army or the Navy is well known. They have accelerated their teaching program and

same time and, in consequence, officials charged with securing medical men for war services should recognize that still further extensive changes in faculties are inadvisable for the immediate future. Most hospitals and medical schools, I believe, have been thoroughly honest in establishing their lists of essential men. Many of them now live in service, or preparing to go into the service, as much as from 40 to 50 per cent of their personnel. This is eminently fair in the present stage of hostilities, and, if it has seemed wise to place on the essential list a small percentage of young men within the limits of draft age, I believe we should be hesitant to seek abruptly to change this system.

Unquestionably the younger members of medical school faculties will join the colors in larger and larger numbers. Nevertheless, with the plan of maximum production in mind, under present standards we should seek to assist teaching centers and hospitals in maintaining efficient teaching staffs. That postgraduate education of specialists may of necessity soon be greatly altered seems inevitable under rapidly changing world conditions.

The trend toward training specialists by long term residencies will have to be altered greatly or perhaps abandoned temporarily if the war continues for a long time. The corollary to this is that military hospitals should make every effort to continue postgraduate teaching of the younger men who have been detailed to them so that these men in the postwar period may receive credit at the hands of their specialty boards for work done in service. Many of the boards have agreed to this step, and I have no doubt that others will be glad to accept the principle as time goes on. A large part of the burden of postgraduate education of specialists will in the future fall on many of the hospitals of two hundred and fifty bed capacity or thereabouts located in cities of 50,000 to 150,000 population. In many instances such hospitals are now doing an excellent job of training in specialties—in the surgical specialties particularly—and with experience and a more adequate realization of the necessity of maintaining present standards I am convinced that more and more postgraduate training will be accomplished in this hospital group.

The present day situation, even before the war, of having more hospital posts available than there were interns has had a salutary effect on many hospital staffs as far as professional organization and evolution of teaching opportunities are concerned. That this same movement to stimulate teaching progress in smaller hospitals located in smaller communities would have been a natural evolution is obvious, and, while such progress will unquestionably be handicapped and perhaps halted by long-time war activities, it is important to look to the future in such matters. I am confident that we may look hopefully for the successful development of a planned program for participation of these centers in the postwar economy.

The postgraduate education of the general practitioner is an entirely different problem from that of a specialist. He obtains postgraduate training either by attending refresher courses in institutions or by attending medical meetings. Actually the vast majority of his continuing education is through attendance on medical meetings which are planned to furnish intensive instruction in a wide variety of professional subjects presented by competent and well known leaders in medical fields. Over a period of years I have been privileged to attend many of these meetings under the auspices of various medical organizations. I have observed the three and four day meetings, and more recently I have been around the country to a series of one day meetings, all of which were essentially of the same character. My observation has been that the general practitioners and part time specialists, and many full time specialists, attend this type of medical program with great enthusiasm and earnestness. I have seen men come into the meeting hall at 8 o'clock in the morning and, except for short intervals for meals, stay until well into the evening. Always the audience was large, always it seemed intensely interested and I believe the meetings were without question uniformly profitable. The type of program, which featured intensive instruction by competent teachers with elimination of discussions which are usually characterized by their reference to personal experiences im-

ited to a small group of cases or a single case, probably accounted for the success of the meetings to which I refer. If these observations are worthy of the interpretation I put on them, it is not too bold a suggestion to offer to the proper authorities of the American Medical Association that a similar type of meeting might be conducted in various parts of the country under the auspices of the parent association. I believe that such programs would further enhance the interest of the medical profession in postgraduate instruction and that the type of programs I have discussed might be advantageously modified in many ways. For instance, these sponsored sectional meetings throughout various geographic areas of the United States are at least worth experimenting with and would, I feel, be a welcome change from the present day type of program to one which is lecture type in part or in whole. We live in a streamlined world in which unorthodox things are continually being accepted, and it is entirely possible that medical programs are not immune to modern changes.

I would be failing in appreciation if I did not acknowledge before you the debt I owe to the headquarters staff of the American Medical Association in Chicago and to the Board of Trustees for the many courtesies and helpful assistance I have received from them during the past year. The ramifications of our medical profession's various activities can be appreciated only by one privileged to view them from within, and the efficient manner in which they are conducted can be properly evaluated only under the scrutiny of close association. As I have gone about the country to address medical organizations I have been impressed with the broad functional scope of the American Medical Association, and I have come to realize more fully the demands which are made on the men who shoulder willingly and efficiently the details of managing this great organization. A corollary conclusion is that a buffer should be placed against overconscientious fulfillment of their responsibility, to the detriment of their health. Steps to provide assistance have already been made and no doubt will be increased in the future, in spite of reluctance on the part of these faithful officers to receive it. It is easy to advise one to slow down, to relinquish part of the burden and in consequence to prolong his usefulness, but my own observation and experience have been that it is difficult to arrest the will to serve, and I have little confidence that the foregoing sound advice will be accepted in full.

As is so often true of the experiences which mean most to us, their very complexity and greatness preclude analysis or reduction to description. In addition to the manifold emotional reactions, which are beyond expression, I have come to feel the gratification which results from association with an organization which is not only fundamental and of proved worth in meeting present human needs but at the same time so constructed and infused with imaginativeness that it possesses the perspective vision necessary to foresee the exigencies of the future.

Altogether, the pleasant tasks of my office, which in the main consist of visiting medical units in many places, or renewing old friendships among the profession, of making new acquaintances in widespread areas and of feeling and seeing the fine spirit of service which motivates our guild, have combined to make my journeyings a joyous Odyssey.

## REPORTS OF OFFICERS

### Report of the Secretary

Dr. Olin West, Secretary, presented his report as printed in the Handbook, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary, except the proposed amendment to the Constitution, which was referred to the Reference Committee on Amendments to the Constitution and By-Laws.

### Report of Board of Trustees

Dr. Roger I. Lee, Acting Chairman presented the following supplementary report of the Board of Trustees, which was adopted by a rising vote.

### SUPPLEMENTARY REPORT OF BOARD OF TRUSTEES

The Board of Trustees regrettably calls the attention of the House of Delegates to the death during the past year of a

former president and chairman of the Board of Trustees, Dr Rock Sleyster of Wauwatosa, Wis. He was an experienced soldier in the ranks of organized medicine, rising from his first position as secretary of a county medical society to the presidency of the Association. His devotion to the ideals of American medicine may well be an inspiration to every American physician.

Dr Charles Alfred Dukes, vice president of the American Medical Association, died in Oakland, Calif., on March 13. Throughout his career Dr Dukes gave freely of himself to public service and to medical organization. He had been a member of the House of Delegates and a wise leader in the affairs of organized medicine in California. In his capacity as a member of our Committee on Medical Preparedness and as corps area chairman of the Procurement and Assignment Service for Physicians, Dentists and Veterinarians he gave unstintedly of his time and of his health.

Dr William Dick Cutter, secretary of the Council on Medical Education and Hospitals since 1931, died on January 22 after a brief illness. In his position on the headquarters staff of the American Medical Association, which he occupied for eleven years, he carried great responsibility and manifested excellent judgment and leadership.

The Board of Trustees expresses here its appreciation of the services and devotion of these three leaders and suggests to the House of Delegates that it express its sense of loss in their absence from this session.

Dr James R. Bloss, Chairman of the Executive Committee of the Board of Trustees, presented the report of the Board of Trustees as presented in the Handbook as well as a second supplementary report of the Board of Trustees relative to meetings with hospital associations, as follows:

#### SECOND SUPPLEMENTARY REPORT OF BOARD OF TRUSTEES

The Board of Trustees has had meetings previously with hospital associations, and at least one of these hospital associations has announced plans at variance with principles set forth by the House of Delegates.

The Board has already considered this matter as a committee of the whole and, in view of the divergent views concerning hospital plans, felt that nothing would be gained by further conferences with hospital associations until more information is available through the Bureau of Medical Economics. Such studies and compilations are in active progress, but, owing to inevitable dislocation due to the war and to constant changes in plans for hospitalization, and the heavy responsibilities laid on the Bureau of Medical Economics by the war effort, these studies have not been completed in spite of the employment of additional help. The Board would suggest that opportunity be given for further study based on the studies by the Bureau of Medical Economics.

#### RESOLUTION EXPRESSING APPRECIATION OF AMERICAN MEDICAL ASSOCIATION FOR FRIENDLY COOPERATION OF THE BROADCASTING COMPANIES

Dr Bloss also presented the following resolution which had been adopted by the Board of Trustees the day before:

WHEREAS, the National Broadcasting Company, the Columbia Broadcasting System, the Blue Network and numerous individual radio stations have from time to time during the past year participated with the American Medical Association or, on request of the Association, with related medical and health agencies in health education broadcasting, now, be it therefore,

Resolved, by the Board of Trustees (House of Delegates) of the American Medical Association that the Bureau of Health Education be directed to transmit on behalf of the Association to the radio stations and networks concerned a copy of this resolution expressing the appreciation of the American Medical Association for their friendly cooperation.

The Speaker referred the report of the Board of Trustees to the Reference Committee on Reports of Board of Trustees and Secretary with the following exceptions. That portion of the report relating to the Bureau of Health Education was referred to the Reference Committee on Hygiene and Public Health, that portion relating to the Bureau of Legal Medicine and Legislation, to the Reference Committee on Legislation and Public Relations, that portion dealing with medicine and the war to the Reference Committee on Military Preparedness, the supplementary report to the Reference Committee on Hygiene and Public Health, the portion of the report referring

to a committee to study the relationship of medicine and law, to the Reference Committee on Legislation and Public Relations, and the supplementary report, first read, to the Reference Committee on Legislation and Public Relations.

#### Report of Treasurer

Dr Herman L. Kretschmer, Treasurer, presented his report as printed in the Handbook, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary.

#### Report of Judicial Council

Dr George Edward Follansbee, Chairman, presented the report of the Judicial Council as presented in the Handbook, which was referred to the Reference Committee on Amendments to the Constitution and By-Laws except that portion which relates to a policy relationship between the scientific sections and the House, which was referred to the Reference Committee on Sections and Section Work.

#### Report of Council on Medical Education and Hospitals

Dr Charles Gordon Heyd, Acting Chairman of the Council, presented the Report of the Council on Medical Education and Hospitals as presented in the Handbook, together with the following revision of the Essentials of an Acceptable School for Clinical Laboratory Technicians, which was referred to the Reference Committee on Medical Education.

Section I Administration Subsection I To be amended by adding the words *approved medical schools*, the amended section to read:

1 Acceptable schools for training laboratory technicians may be conducted by *approved medical schools*, general hospitals, or state health laboratories affiliated with hospitals, where the majority of the student's practical training is received. This arrangement should not discourage affiliation between the hospital and universities, colleges, public health laboratories or other hospitals.

#### Report of Council on Scientific Assembly

Dr James E. Paullin, Chairman, presented the report of the Council on Scientific Assembly as printed in the Handbook, which was referred to the Reference Committee on Sections and Section Work.

#### Report of Committee on Medical Preparedness

Dr Irvin Abell, Chairman, presented the following report, which was referred to the Reference Committee on Military Preparedness:

The Committee on Medical Preparedness of the American Medical Association was appointed at the June 1940 meeting of the House of Delegates in New York. A report covering its activities during the ensuing year was made at the June 1941 meeting of the House of Delegates in Cleveland. The present and final report covers its operations during the past year. It may be well to recall that the Committee on Medical Preparedness came into being as the result of a request of the Surgeon General of the Army that the American Medical Association undertake a survey of the medical personnel of the United States and its possessions to determine the number of physicians available for service in various capacities and to develop facts that would be useful in aiding the profession to render the greatest possible service in any national emergency that might arise. Among the objectives which the committee hoped to ascertain as fully as possible through this nationwide survey were (1) the number of physicians licensed to practice medicine, (2) the number capacitated for active service and the number of those incapacitated, (3) the number and location of physicians who may be qualified and available for service with the military forces of the nation and for other essential governmental services in case of national emergency, (4) the number available for service to the civilian population under emergency conditions, (5) the availability and qualifications of those who can serve acceptably in special fields of medicine, (6) the number and identity of physicians qualified for teaching and research in national institutions and (7) the number and identity of physicians already engaged in governmental service. During the first year of this study the efforts of our country were directed to war preparedness, while during the second year the civilian call

## THE CENSUS OF PHYSICIANS

The following information, statistical and otherwise, will attest the fidelity displayed by your committee in carrying out the instructions given to it by the House of Delegates.

The census of physicians, which was conducted by the Bureau of Medical Economics for the Committee on Medical Preparedness, began on July 5, 1940 with the mailing of schedules to approximately 180,000 physicians whose names were listed in the 1940 American Medical Directory. Of the 180,000 physicians, slightly more or less, who received this schedule, about 158,000, or approximately 86 per cent, supplied the information requested and returned the schedule to the American Medical Association. Schedules for the remaining 22,000 more or less physicians were prepared in the Bureau of Medical Economics or at the headquarters of some of the state medical societies with the incomplete information that was available in the American Medical Directory or from other sources. These schedules were marked "Incomplete," since all the information requested could not be supplied except by the physicians themselves. Since it was the desire of the staff to have in the punch card file information pertaining to all physicians in the United States, this method of preparing schedules for those physicians who, for some reason, failed or neglected to prepare their own schedules was used in order that a minimum of information might readily be tabulated for all physicians.

The census was undertaken to secure current information pertaining to the number, age, location, professional qualifications and other characteristics of individuals who comprise the medical profession in order that such information might be readily available to the Surgeon Generals of the Army and Navy in securing medical officers for war service.

It has been impossible for the staff that conducted the census of physicians to pursue the number of statistical analyses that could have been prepared from the data furnished by the medical profession. Only those statistical compilations that were deemed essential to a better understanding of the nation's available and effective medical manpower have been made.

No census figures express the quantitative value of the population group studied with any degree of accuracy except at a stated day or hour. It became necessary, therefore, to record changes in the census information as soon as the schedules were received. These changes fall largely into three or four groups: deceased physicians, physicians recently licensed, physicians whose professional qualifications are changed and physicians who have changed their addresses. From the very beginning of the census, a part of the routine of the staff has been to correct the schedules and punch cards of physicians who fall in these four categories as quickly as reliable information of this nature has been received. It has not been possible to make changes in location on the listing sheets, but an effort has been made to keep up to date a system of follow-up in the published directory reports so that the latest known addresses of physicians might readily be found.

## TOTAL NUMBER OF PHYSICIANS—VARIOUS SERVICES

Even before the census of physicians had progressed for no more than a week, deductions because of deaths were necessary. As time passed the names of newly graduated and licensed physicians were added. The result of two years of census effort with many corrections has given the committee records and punch cards for more than 181,500 physicians in the United States and its outlying territories and possessions. Of this number, some 176,000 physicians are located in the continental United States. Within the continental United States there were, as of Jan 31, 1942 85,964 physicians in general practice and 90,227 physicians (including those classified as fully qualified specialists devoting their full time to a specialty and physicians who devote only special attention or a part of their time to some special branch of medicine). The ratio of full time specialists to special attention physicians is about 43 to 57.

To arrive at the number of physicians who are engaged in the private practice of medicine it is necessary to deduct the number of physicians who are engaged in some service exclusive of the private practice of medicine. The total number of physicians engaged in full time appointments is 7,216. Of these, 2,816 hold teaching appointments, 910 are engaged in full time

research work, 1,179 hold executive positions and 2,243 are engaged in full time work in industry. It is believed that most of those in the last named category are actually contributing much to the health of the industrial population although in many instances not actually caring for the sick or injured workmen.

The total number of physicians found to be employed in some form of government service, as of July 1940, was 9,819. This number has probably changed considerably in the past two years with the addition or reduction of the number of physicians in the several governmental services.

In public health there were U S Public Health Service, 1,789, state health departments, 1,410, local health departments, 2,341, Veterans Administration, 1,779, Indian Field Service, 910, other federal agencies, 2,293.

In hospital service there was a total of 16,457 physicians in hospital administration, 3,089, as residents, assistant residents and fellows, 6,149, as interns, 7,219.

## RACES AND AGE GROUPS

Classified in private practice there were in the continental United States at the beginning of 1942 about 142,700 physicians of all ages according to the most reliable figures that can be drawn from the census data. Of the 176,191 physicians in the continental United States, 164,488 were white male, 8,035 were white female, 3,362 were Negroes (both sexes) and 306 were of other races.

Distributed by age and including both general practice and specialists, in January 1942 there were in the continental United States 42,721 physicians under 36 years of age, 38,212 physicians between 36 and 44 years of age inclusive, 31,904 between 45 and 54 years and 63,354 who were 55 years of age and older. Among the 176,191 there were 3,942 physicians who were 80 years of age and older, 255 who were 90 years of age and older and 6 physicians who were 100 years of age or older.

It will be seen from these figures that the medical manpower resources of the continental United States, for military purposes, at the beginning of 1942 numbered approximately 112,800 physicians, since that was the number within the age limit for service in the Army. The requirements of the Navy would be drawn from this same number, although the upper age limit for original commission in the Navy is 50 years.

It must be remembered, however, that not this entire number of about 112,000 physicians can be made available to the Army and Navy, since to provide the armed forces with war material with which to accomplish their mission it is necessary to provide health and medical services for the civilian and industrial population. It is known also that many of these 112,000 physicians could not qualify physically for full military service.

The 63,354 physicians who are 55 years of age and older cannot be expected to supply all the medical services needed by the civilian and industrial population even when reduced by the removal from the ordinary population of several million men in the armed forces.

Tables which show the numbers of physicians by age, specialty and location are too large and complicated to show here. Such tables have been prepared, however, and are available for use in connection with the medical war effort.

## PROBABLE SHORTAGES IN CERTAIN SPECIALTIES

It is important also to make some mention of the relative numbers of physicians in certain specialties in relation to the military and civilian needs. There are certain specialties in which the number of qualified physicians is so small that when military and civilian needs are considered there appears at once a serious problem of equitable distribution of the available supply of specialists. The fields in which this problem is most serious are neurosurgery, plastic and maxillofacial surgery, orthopedic surgery, thoracic surgery, neurology, anesthesia, pathology, clinical pathology and bacteriology.

There is likewise a serious problem in relation to the supply of qualified physicians to supply certain services in industry.

An important work of the staff that has conducted the census has been the compilation of a file of physicians who are now on extended active duty with the armed forces arranged

according to the states that have contributed these physicians from their medical manpower resources. Within the last month there has been received at the American Medical Association a list of commissioned officers prepared from duplicates of the punch cards that are a part of the Adjutant General's records. Other lists have been received from the Surgeon Generals of the Army and Navy that enable the staff to keep the records at the American Medical Association as nearly correct and current as it is possible to do. Arrangements have been made to receive regular reports of the numbers and names of physicians who are being commissioned by the recruiting teams now working throughout the United States.

#### CLEARANCE OF PHYSICIANS

Since the primary object of the census was to accumulate information that could be made readily available to the Surgeon Generals of the armed forces in the performance of their duty to provide medical services for the military establishment, the data that have been collected have been arranged in a manner that could be utilized easily for reporting to the Surgeon Generals on the location, medical education, age, licensure and qualifications of physicians whose names might be submitted to this office. The basic parts of the census had been almost entirely completed when the Procurement and Assignment Service was authorized in October 1941. Immediately after the organization of the Procurement and Assignment Service, the census material which had been arranged in listings was put to practical use in the clearance of physicians who had applied for commissions in the Medical Corps. The medical preparedness section of the Bureau of Medical Economics was designated as the Consultant Office of the Procurement and Assignment Service, and the director of the Bureau of Medical Economics was made the supervisor of that consultant office.

Since November 1941, when the work of the medical preparedness staff of the Bureau of Medical Economics was coordinated with the Procurement and Assignment Service, the amount of work required for the processing of the names of physicians who had applied for commissions in the medical corps is represented by the following figures. The number of names cleared for commission, 13,468. Of these cleared names, 100 were those of Negro physicians, and 1,753 were marked for assignment to the air force. In addition to the names which have been processed for commissions in the Medical Corps, lists of about 7,000 physicians in general practice and the specialties have been prepared for the Selective Service System in connection with its program of rehabilitation.

#### RECRUITING TEAMS

During the third week of April of this year the Army adopted a new policy for the purpose of securing physicians for commission in the Medical Corps. At present there are recruiting teams each consisting of a medical officer representing the Surgeon General of the Army who is to make the physical examination, and a line officer representing the Adjutant General of the Army, who is to assist in preparing other papers and to administer the oath of office for physicians who are commissioned in the grade of first lieutenant and captain. Already requests for clearance of names have been received from several recruiting teams or state chairmen. It is anticipated that this office may receive such requests from a large number if not all of the state chairmen for the Procurement and Assignment Service or the recruiting teams in the several states. In addition to the information requested for physicians who are to be given the grade of first lieutenant and captain, the regular clearance forms are still being forwarded from the Procurement and Assignment Service in Washington for those physicians who presumably are to be given a grade above that of captain.

The length of time which is required for the clearance of any particular physician, if considered separately, is not great, but, when that amount of time is multiplied by several hundred forms that are received at one time, the amount of time required for clearance becomes considerable. If to this is added the requests for clearance for some three or four dozen from each of the states, the amount of time required for clearance then

becomes very considerable. Each state is, quite naturally, anxious to receive its clearance papers as soon as possible, but only one state can be cleared at a time, and work is conducted in as orderly a fashion as possible, giving each request the priority of the order in which it is received.

Every effort has been made to make available to the Army, Navy, Public Health Service, Selective Service System and other governmental agencies, either directly or through the Procurement and Assignment Service, information to assist in the procurement of physicians to fill either general or specific assignments. Some interesting data have come out of this circularization of the profession which shows the trends and types of practice now most popular and which therefore indirectly influence army service.

#### PROCUREMENT AND ASSIGNMENT SERVICE ESTABLISHED

As these compilations and studies were being made by the Committee on Medical Preparedness it became apparent that certain conditions limited their utilization by the medical departments of the armed forces. Chief among these was the lack of volunteer applications for commissions in the Medical Corps, the greater percentage of calls to duty going to the Medical Reserve Corps and to the National Guard, the personnel of which was utilized to the extent made possible by physical fitness and availability of commissions commensurate with rank. The question of securing additional enlistments was given consideration by all of those cognizant of its need. The Subcommittee on Medical Education of the Health and Medical Committee recommended the establishment of an agency for the procurement of physicians for the armed forces, industry and the civilian population. This recommendation was referred to the Committee on Medical Preparedness, which, during its several sessions at Cleveland, canvassed the situation and presented to the House of Delegates a resolution relative to the establishment of a procurement and assignment agency to be concerned with the provision of medical personnel for the Army, Navy, Public Health Service and other agencies. This recommendation was unanimously adopted by the House of Delegates and subsequently sent to the Surgeon Generals of the Army, Navy and Public Health Service, to the Health and Medical Committee, to the administrator of the Federal Security Agency and to the President. This resolution was presented to the Health and Medical Committee at its meeting on July 2, 1941. The committee voted to adopt it in principle and to forward it to the Coordinator, Mr. McNutt, with the suggestion that he consult with the Secretaries of War and Navy and that all matters concerning details of organization remain contingent on action taken by these officials.

The Committee on Medical Preparedness met in Washington on Aug. 19 and 20, 1941 to consider this resolution in conjunction with representatives of the various federal agencies interested in securing physicians for their services. On Sept. 3, 1941 an executive order promulgated by the President established the Office of Defense Health and Welfare Services with the Federal Security Administrator, Mr. Paul V. McNutt, as director. The Health and Medical Committee was transferred to this office and given the specific duty of advising the director regarding the health and medical aspects of national defense exclusive of medical research and to assist in the coordination of health and medical activities affecting national defense. The resolution of the Committee on Medical Preparedness relative to the establishment of a Procurement and Assignment Service was referred to the Health and Medical Committee, which on October 22 held a meeting to initiate the development of such a service. The meeting was attended by the director of the Office of Defense Health and Welfare Services and his staff, by representatives of the Army, Navy, Public Health Service, Civil Service Commission, National Institute of Health, American Medical Association, American Dental Association, by the full membership of the Health and Medical Committee and by the chairmen of its subcommittees on Medical Education, Dentistry and Hospitals. An agreement on policy was reached and a commission appointed to draft a program for the Procurement and Assignment Service. On the receipt of its report Director McNutt transmitted its recommendation to the President with the result that the Procurement and Assignment Service

Service was established as one of the subdivisions of the Office of Defense Health and Welfare Services. The Health and Medical Committee and the Procurement and Assignment Service are closely correlated in that the Subcommittees on Dentistry, Hospitals, Industrial Health and Medicine, Medical Education and Negro Health of the two agencies have practically the same personnel. On December 18 at a meeting of the Board of the Procurement and Assignment Service with the preparedness committees of the American Medical Association, the American Dental Association and the American Veterinary Medical Association a definite organization was completed for the functioning of this service in relationship to needs of professional personnel in the war which broke upon us on December 7.

Approval was given to the constitution of committees in each of the corps areas and associated naval districts to function in an advisory capacity to the corps area commander, the committees to consist of a chairman, who will be the corps area representative of the Committee on Medical Preparedness of the American Medical Association, one physician representing medical education, one representing the hospital organizations, two representing the profession at large, two members of the dental profession and one member of the veterinary profession. In most instances the state chairmen of the Procurement and Assignment Service are the state chairmen of the Committee on Medical Preparedness of the American Medical Association. This close integration permits of an intelligent use of the data compiled by the Committee on Medical Preparedness to the end that the service rendered by the medical profession during the war will be used to the greatest possible advantage. The Committee on Medical Preparedness of the American Medical Association met in Washington on Jan. 30, 1942 with the Board of the Procurement and Assignment Service and representatives of the various interested agencies for the purpose of adopting final plans of procedure and action in utilizing the available professional personnel of the country for the duration of the war. Your committee has striven at all times to attain the objectives outlined in your instructions, which may be epitomized as loyal and complete participation in what is now an all out war effort. A final meeting of the Committee on Medical Preparedness was held in Chicago on May 9, 1942, at which its work for the past two years was reviewed. The census so far prepared is a continuing process, new schedules being required for recent graduates, older ones being withdrawn because of death or retirement. A large amount of clerical work is involved in change of addresses and in names of physicians ordered to active duty. An important phase of the census pertains to the professional and ethical qualifications of those on the roster.

#### RECOMMENDATIONS

As one who has done but little of the detailed work, the chairman desires to record for the appreciation of the House of Delegates the devoted and faithful service of the other members of the committee who have given unstintedly of their time and effort in carrying out your instructions. The corps area chairmen and the headquarters personnel have not regarded any sacrifice too great in promoting the committee's work, such sacrifice demanding not only intense application and tedious effort but appreciable donation of time from home and practice. The committee has spent many thousands of dollars of the Association's funds, and its members have devoted many hours of their time in accomplishing the survey, the like of which has not been done before. Since the objectives sought in the request of the Surgeon General of the Army have been attained as far as lies within the power of the committee, the Committee on Medical Preparedness begs to express to you its appreciation for the opportunity of service which you have given it and requests that it be now discharged.

Since the national preparedness program has now been superseded by actual participation in war, the Committee on Medical Preparedness recommends to the House of Delegates the appointment of a committee for the duration of the war to be known as the "Committee on Participation of the Medical Profession in the War Effort" composed of five members appointed by the Speaker of the House with the President, President-Elect, Chairman of the Board of Trustees, Secretary of the Asso-

ciation and the Editor of THE JOURNAL as ex officio members. The Committee on Medical Preparedness was appointed to accomplish a specific requested purpose the proposed Committee on Participation of the Medical Profession in the War Effort in keeping close touch with all policies affecting the quality and efficiency of medical service both to the armed forces and to the civilian population would feel free to express comment and criticism of policies relating to the participation of medicine in the war effort. Without authority to act it could advise, expressing the view of the medical profession on such proposals as are made having a direct bearing on the principles which our Association regards as fundamental in providing good medical service.

#### Report of Committee to Study Problems of Motor Vehicle Accidents

Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, presented the following report, which was referred to the Reference Committee on Hygiene and Public Health.

#### TRENDS IN MOTOR VEHICLE ACCIDENTS

In a previous report published in May 1939 the members of the committee noted the decrease throughout the country in motor vehicle accidents since the peak of 1937 and stated that the members of the committee "are convinced that the improvement is due chiefly to education and traffic law enforcement." Unfortunately, this decrease in accidents has not held. Motor vehicle accidents are again increasing, and in 1941 they reached a new and all time high with 40,000 persons losing their lives from this cause alone. Are our law enforcement officers becoming more lax, and has the educational program been allowed to lag? The members of the committee do not feel that this is the cause but believe that it is due to the increase in travel and to the increasing national defense activity since the invasion of France.

In 1942 and until the end of the present war, many cars will leave the road because of the shortage of tires and of gasoline. There will be fewer drivers, and speeds will be lower so as to conserve these essential materials. If these were the only factors, we might expect a large reduction in traffic accidents and deaths throughout the country.

Unfortunately, there are other factors which may lead to further increases in traffic deaths in areas of increasing defense activity. Defense workers must continue to go to and from their jobs, and in many instances this will require continued use of motor vehicles. Motorists will be driving on poorer tires, new cars will not be available, and every "jalopy" that can navigate may be put to use. More workers will ride in each car, thus increasing the average number of workers that will be injured in each accident. In addition, the general mental and nervous strain which is always present in a time of national emergency and is especially prevalent in war industry areas may be reflected in the driving habits of the workers. It is unfortunate that traffic accidents among defense workers are all too frequent, occurring particularly among the young, inexperienced drivers or the older "rusty" drivers and the drinking driver and pedestrian.

What responsibility for the driving habits of the general public falls on the medical man? Probably far more than is evident at first glance. As more of the younger and able bodied men enter the armed forces, more civilian duties will

be taken over by older, less alert men and women. Many of these duties require driving cars. The medical profession can aid by keeping the public cognizant of these facts and by reiterating the need for maintaining high physical standards in our civilian population.

#### TRANSITORY AND PERMANENT DEFICIENCIES

The public in general, and law enforcement officers in particular, should be impressed with the fact that minimal physical standards which may permit an individual to obtain a driver's license do not constitute ideal standards. As stated in our previous report, "in licensing the public, only the *certainly unfit* may be rejected and all questionable applicants must be given the benefit of the doubt and accepted." These individuals with minor physical defects should, however, be impressed with the fact that driving safely will be more difficult for them. This also can be done by the physician in his private practice, and in this respect the committee wishes to reemphasize the recommendation made in its previous report regarding transitory deficiencies.

Regarding permanent conditions which may interfere with driving ability, we wish to comment particularly on two points. First of all, deafness is less a traffic hazard than is ordinarily believed. Most persons with this debility are able to compensate for their deficient hearing, and there is no record of a greater accident rate among the deaf than among the normal population. However, it is recommended that people with defective hearing equip their cars with outside rear-view mirrors so as to increase their ability to detect the presence of cars behind them.

The presence of epilepsy should be sufficient reason for denying a driver's license. For practical purposes any person having a permanent condition which may cause temporary unconsciousness should be included in this category. When applying for a driver's license, it should be mandatory to report all deficiencies which might interfere with driving ability. It is also important that the individual applying for a driver's license be properly identified, since many people who feel they may be physically disqualified have furnished a substitute for the examination.

#### ALCOHOLIC INTOXICATION

The role of alcohol as a factor in traffic accidents has continued to receive widespread attention. An ominous trend has been observed, namely that fatal traffic accidents involving reported drinking by drivers increased 27 per cent in 1941, whereas the increase in other fatal traffic accidents was only 17 per cent. The fact that a large proportion of the alcohol accidents occur among workers in war industries makes this a serious problem in national defense.

Physicians can aid enforcement officers in the control of drinking drivers by making examinations of drivers suspected of being under the influence of alcohol and seeing that the cases are prosecuted in a scientific manner rather than by relying on hit or miss lay opinion. To this end, chemical tests of body fluids or breath should be used in addition to clinical examinations in determining the degree of intoxication. The use of chemical tests for confirming or disproving alcoholic influence should increase the prestige of expert medical testimony.

Clinical pathologists are particularly well suited to perform the chemical tests and to present competent testimony in court. Any physician, however, can supervise the taking of the specimens and can handle testimony in court if he will thoroughly acquaint himself with chemical, medical and legal phases of such tests. The committee recommends that any physician who is to testify in such cases fully acquaint himself with the work done by the National Safety Council in this regard, and that he secure from the Council copies of reports<sup>1</sup> describing standard procedures for making clinical examinations and for avoiding legal pitfalls in taking specimens, making the chemical analyses and presenting testimony in court. Further, physicians personally should acquaint themselves with the chemical principles of such tests before testifying in court.

<sup>1</sup> Reports of the Council's Committee on Tests for Intoxication can be obtained by writing the National Safety Council, Chicago.

Much progress has been made in the acceptance of chemical tests for intoxication by the legal profession. Four states, Indiana, Maine, New York and Oregon, now have legislation dealing with the use of evidence obtained through chemical tests for intoxication. In addition, evidence obtained through chemical tests has been used in drunken driving cases in more than twenty-eight other states during the past year.

The committee reiterates its previous recommendations that the percentage of alcohol in the blood is a reliable index of the degree of intoxication, especially when considered along with external symptoms of intoxication. For those who do not recall the previous recommendations of this committee, we wish to repeat briefly the chemical standards for the legal interpretation of "under the influence of alcohol" in terms of the percentage of alcohol in the blood or its equivalent in other body materials.

1 Below 0.5 per cent alcohol in the blood no influence by alcohol within the meaning of the law,

2 Between 0.05 and 0.15 per cent, a liberal, wide zone alcoholic influence usually is present, but courts of law are advised to consider the behavior of the individual and circumstances leading to the arrest in making their decision,

3 0.15 per cent definite evidence of "under the influence," since every individual with this concentration would have lost to a measurable extent some of that clearness of intellect and control of himself that he would normally possess. These standards have proved themselves to be fair and practical. The zone below 0.05 per cent vindicates the nondrinking or temperate driver, the wide middle zone considers tolerance and idiosyncrasy, and the highest zone indicates alcoholic influence regardless of unusual tolerance. The chemical tests can be performed with remarkable accuracy and are the best means of proving alcoholic influence. It is necessary, however, that care be used in making the tests and that those who run the analyses have sufficient experience and are able to show that they can perform the tests accurately.

Claims have been made that the results of chemical tests should be interpreted differently in those states where the courts interpret the phrase "under the influence" to mean that the person is not able to drive in the manner of the "ordinarily prudent or cautious person." Such claims state that some skilful drivers with a blood alcohol concentration of 0.15 per cent or more may still be better drivers than the poorest drivers who have managed to pass the tests for a driver's license, although admitting that even these "superior" drivers have been definitely affected by the alcohol.

This committee recognizes the differences in legal interpretations of the phrase "under the influence" but points out that the "safest" driver is not necessarily the most "skilful" in performing skill tests. Results of brake reaction time tests, for example, reveal that persons with the fastest reaction time in applying brakes do not necessarily have the best accident records. This may be due to their driving a little faster and otherwise adjusting their driving habits to their superior physical ability, so that they have no greater margins of safety than other drivers who adjust their driving habits to their physical limitations. Thus the committee believes that a superior driver who lowers his ability by the use of alcohol is a hazard on the road, even though he may still be able to perform skill tests as well as the less skilful sober driver. He has lost some of his good judgment and superior ability to react to danger yet usually will not adjust his driving habits in accordance. Driving a car is such a hazardous occupation, even under the best of circumstances, that no driver should have the legal or moral right to lower his driving ability deliberately to any extent. One might as well argue that persons with superior driving skill should be permitted to ignore speed limits, stop signs and traffic signals.

There is need for a more uniform interpretation of the phrase "under the influence of intoxicating liquor" so as to avoid controversy in the interpretation of chemical tests. The committee wishes to urge again that all states consider the definition of the phrase given by the Arizona Supreme Court<sup>2</sup> which is

<sup>2</sup> Steffert v. State (Ariz.), 42 Pac. (2d) 615

siders an individual under the influence of intoxicating liquor when, owing to imbibing such liquor, he has lost to any extent some of that clearness of intellect and control of himself that he would otherwise possess. This is preferable to comparing the manner of driving to that of "an ordinarily prudent and cautious person." In those states in which the definition is based on the driving ability of "an ordinarily prudent and cautious person," the committee urges that courts consider the difference between a "prudent" person and a "skilful" person. It is well known that alcohol affects judgment before affecting ability to perform skill tests, and thus some persons may still be able to perform certain skill tests satisfactorily and yet have their judgment affected so that they could not be considered "prudent" drivers.

#### FIRST AID

The committee recommends that every physician carry in his car at all times a first aid kit so equipped that he may handle efficiently the immediate treatment which may be needed in traffic accidents. This kit will also be of value in handling casualties which may arise from "total war." A physician is supposed to be ready and able to handle emergencies, and it is of little value to know what must be done and to be forced to state that the wherewithal is at the nearest hospital 20 miles away. The first aid kit should include sterile dressings, bandages, disinfectants, tourniquets and splints which are not normally carried in the medical kit. The American Red Cross furnishes, at cost, kits of various sizes containing replaceable units.

The doctor must not assume that his course in medicine alone has been sufficient to enable him properly to teach first aid, or even to administer it with maximum efficiency. First aid methods constantly are being improved and it is important that each physician become acquainted with the present "best seller," the Red Cross First Aid Textbook. Such information will minimize the criticism of Red Cross first aid methods by physicians who have not taken the time to discover that the procedures advised in the manual have been approved by many organizations including the American College of Surgeons.

In the present emergency, thousands of laymen are being trained in first aid. Such training is highly recommended, but the committee feels that such instruction should have the supervision and guidance of the medical profession. Many physicians are cooperating with lay instructors in teaching Red Cross first aid courses. The committee feels that such cooperation should be adopted more generally and that the various state and county societies should, through their members, act in an advisory or teaching capacity for all such courses whenever possible. A little knowledge may be a very dangerous thing unless properly guided and controlled.

The first aid program in Milwaukee County might be mentioned because it is the only community in which all first aid courses are taught under the supervision of physicians assigned by the county medical society. The physician who criticizes the lay first aider for the manner in which an accident victim is brought to him should realize that it is the physician's responsibility to instruct the first aider properly. As a matter of fact the physician and the victim often have reason to be grateful for properly administered first aid. There is no doubt that first aid is an increasingly important factor in preventing accidents saving lives and minimizing disability.

"The American Red Cross reports a very lively interest on the part of physicians everywhere in equipping themselves adequately to teach emergency first aid to lay groups and on the lay level. For instance, in the city of Washington alone within the past four months more than three hundred medical doctors have taken first aid refresher courses in order that they might be fully prepared to handle their own classes. This is only an example of the same understanding active cooperation by physicians throughout the entire country and is especially gratifying when one remembers that Red Cross first aid stems directly from the best experiences of the medical profession. All in all, it does indicate a professional support and a program soundness which combine in making an asset of tremendous importance in these times of total war."<sup>3</sup>

#### DRIVING BY PHYSICIANS

Finally, the committee feels the physician should consider himself as a part of the problem of controlling motor vehicle accidents. Many physicians will be needed in the Army and Navy. This will increase the load of those remaining in civilian life. It will mean longer hours, more house calls, greater pre-occupation and consequently increased fatigue. All these factors contribute as driving hazards. When you are at the wheel of your car, forget Mrs. Smith's impending coronary thrombosis and concentrate your faculties on the stop light ahead or the child on the sidewalk who may dart suddenly into the middle of the road. Consider also the fact that it may be necessary for the physician to drive during blackouts. In England during the early air raids more people were injured in traffic during blackouts than were hurt by enemy bombs. Don't drive at such times unless it is absolutely necessary. When it is imperative, exercise utmost care and follow the instructions of the local defense council.

The criticism has been made that physicians take advantage of the privileges granted them by law enforcement officers and make a habit of disregarding traffic regulations. This privilege should never be abused. As physicians it behooves us all to aid wherever possible in decreasing a mode of slaughter which, during the last nineteen months, killed more people than the number of soldiers lost during the nineteen months of combat on the battlefields of Europe.

HERMAN A. HEISE, Chairman

BURT R. SHURLY

THOMAS A. MCGOLDRICK

#### NEW BUSINESS

##### Resolution on Preserving Progressive Technics in Medical Practice

Dr. E. H. Cary, Texas, presented the following resolution, which was first referred to the Reference Committee on Military Preparedness and later referred by the Speaker to the Reference Committee on Miscellaneous Business.

WHEREAS There is a unanimous acceptance by physicians of the United States that the seriousness and scope of the existing worldwide conflict demands the unreserved and unqualified devotion and sacrifice to the ultimate limit of individual ability and capacity; and

WHEREAS An all professional agency, the Procurement and Assignment Service has been established officially and entrusted with the all important task of providing professional personnel to meet civilian and military health and medical requirements for the period of the emergency; and

WHEREAS It is considered that the assigning of this vast and vital responsibility to this strictly professional agency represents an unequalled tribute to and an unparalleled achievement of the medical profession; and

WHEREAS The Procurement and Assignment Service functions as a department of government and embodies within its various corps area and state committees a predominant majority of the trustees and officers of national and state medical societies; and

WHEREAS There is the prospect of the need for forty thousand possibly fifty thousand qualified physicians to serve directly with military forces; and

WHEREAS The conditions under which physicians have been able to function in the United States provide the factor most nearly responsible for the relatively enviable position which medicine now occupies and which is enabling organized medicine to provide the personnel and professional competence that represents an essential even vital contribution to the war effort; and

WHEREAS It is a chief responsibility of the profession to do its utmost to continue progressive technics in medical service which will provide opportunity for those physicians who are called to military service to reenter private practice under conditions which will insure continued progress and maximum effectiveness in civilian service; therefore be it

Resolved That we the House of Delegates of the American Medical Association place ourselves officially on record as recognizing our responsibility for making the utmost effort to preserve the elements of independence and freedom of action that will make possible the easy reentry of physicians to civilian practice. To this end we recommend that a definite part of each program of every component member medical society be devoted to a reconsideration of the traditions, the standards, the freedoms, the effects of the absence of restraints and outside control which have contributed so materially to American medicine's unequalled progress and vast achievements.

<sup>3</sup> Personal communication from Richard W. Thrush, National Assistant Director, First Aid and Accident Prevention of American Red Cross.

### Resolution on Control of Venereal Disease

Dr George W Kosmak, New York, presented the following resolution, which was referred to the Reference Committee on Hygiene and Public Health

WHEREAS, Published reports indicate an increasing prevalence of venereal disease in the armed forces and defense workers of this nation, and

WHEREAS, Commercialized prostitution constitutes an outstanding factor in the dissemination of these diseases and requires an intensified campaign against their elimination, therefore be it

*Resolved*, That the House of Delegates of the American Medical Association takes the following stand (1) that the control of venereal disease requires elimination of commercialized prostitution, (2) that medical inspection of prostitutes is untrustworthy and inefficient, gives a false sense of security and fails to prevent the spread of infection, and (3) that prostitution is unlawful, and physicians who knowingly examine prostitutes for the purpose of providing them with medical certificates to be used in soliciting are participating in an illegal activity and are violating the principles of accepted professional ethics

### Resolutions Requesting Change in By-Laws Limiting Time for Introduction of New Business in House of Delegates

Dr J C Sargent, on instruction of the State Medical Society of Wisconsin, presented the following resolutions, which were referred to the Reference Committee on Miscellaneous Business, except that portion of the resolutions containing an actual amendment to the By-Laws, which was referred to the Reference Committee on Amendments to the Constitution and By-Laws

WHEREAS, The business of the House of Delegates of the American Medical Association, except that placed before it by the Board of Trustees and the several sections, consists almost entirely of resolutions introduced by delegates on instruction of their constituent state societies, and

WHEREAS, These resolutions commonly are drawn up and adopted by the constituent state societies months in advance of the annual session of the House of Delegates, and

WHEREAS, It would be of great help to each delegate in determining his attitude on all proposed business if he was apprised in advance of the nature of that business and thus given the opportunity of sounding out the will of the membership that he is elected to represent, be it hereby

*Resolved*, That in the future all new business to be brought before the House of Delegates of the American Medical Association, except it be business introduced by the Board of Trustees or by sections of the Association then in session, shall be filed with the Secretary and by him in turn forwarded to all state secretaries and to all delegates well in advance of each session, and be it further

*Resolved*, That to implement this the By Laws of the American Medical Association shall be changed in chapter II, section 3, to read

Chapter II, Section 3 Limit of Time for Introduction of New Business Unanimous consent shall be required for the introduction of new business *not filed in proper form with the Secretary of the Association sixty days before the annual session of the House of Delegates*, except when presented by the Board of Trustees, the officers of the sections or the sections All new business so presented shall require a three fourths affirmative vote for adoption

\* The italicized words represent the proposed change and are intended to replace the words "at the last meeting of"

### Resolution on Tribute to Physicians and Surgeons of Honolulu County Medical Society

Dr D S Towne, New York, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business

WHEREAS, The civilian physicians and surgeons of the Honolulu County Medical Society rendered a great service during the Pearl Harbor attack on Dec 7, 1941, and

WHEREAS, At the outset of the emergency they promptly responded to a call for aid from the Tripler General Hospital of the Army and by their surgical skill and unremitting efforts rendered great aid to the wounded, and

WHEREAS, By this service a new chapter was added to the successful treatment of war casualties and certain surgical procedures were established which will result in the saving of many lives and limbs from war injuries, and

WHEREAS, Their service was the more outstanding because only a few of them had ever been under fire, and by their courage and stamina they did much to aid the morale of the wounded, of the hospital personnel and of the civilian population, and

WHEREAS, The services of the physicians and surgeons were recognized in the official Roberts Report of the Attack by the statement that 92 per cent of the medical profession were available on that eventful historic occasion, and

WHEREAS, The Medical Society of the State of New York has gone on record in commendation, therefore be it

*Resolved*, That the American Medical Association recognizes the response of the civilian physicians and surgeons of the Honolulu County Medical Society to emergency duty and renders a tribute to their demonstration of the traditional willingness of our profession to act promptly and skilfully in all national emergencies

### Resolutions on Hospital Corporations Engaging in Practice of Medicine

Dr E H Skinner, Section on Radiology, presented the following resolutions, which were referred to the Reference Committee on Miscellaneous Business

WHEREAS, The House of Delegates approved a resolution, introduced by Dr Harry H Wilson at the 1941 session, instructing "the Board of Trustees of the American Medical Association to confer with similar committees representing the American Hospital Association and the Catholic Hospital Association of the United States, the conjoint committees to study and submit reports to their respective national bodies, in which would be outlined platforms or principles designed to clarify the relation of medical services that may be offered in pre payment hospitalization and similar plans, the same to be in line with the basic principles laid down in the past by the House of Delegates and other authorities of the American Medical Association", and

WHEREAS, The Board of Trustees was requested in the same resolution to "proceed to these matters as expeditiously as may be possible", and

WHEREAS, Evidence of continued encroachment of hospitals into the practice of medicine are manifest in numerous group hospitalization plans which offer certain medical services on a service basis as a part of hospital care and in plans adopted by numerous hospitals which include certain medical services in an "all inclusive" per diem rate for hospital care, now therefore be it

*Resolved*, That the House of Delegates reaffirms the principles enunciated in official resolutions over a period of many years opposing the practice of medicine by corporations or the interjection of a third party into the personal relationship and financial transaction between doctor and patients, and be it further

*Resolved*, That hospital corporations should not be permitted to engage in the practice of medicine through the medium of employed physicians or to enter into contracts with any individual, group or agency whereby the hospital agrees to furnish any medical services, and be it further

*Resolved*, That, to the end that hospitals be discouraged from offering the services of licensed physicians to patients on a contract or service basis, all fees for medical services rendered in hospitals should be collected by or on the account of the physician rendering such service, and all physicians concerned in the care of a patient should give or send directly to the patient or other responsible party a statement showing charges for professional services rendered; provided, however, that an exception to the foregoing principle may be made in the case of a formally organized partnership of physicians which acts in the capacity of an individual, and be it further

*Resolved*, That the definitions of medical service and hospital service as applied to the principles stated herein shall be consistent with those applied in previous declarations of the House of Delegates in which medical services are construed as the services rendered by licensed practitioners of medicine, and hospital service as limited to hospital accommodations such as bed, operation room, medicines, surgical dressings and general nursing care, and be it further

*Resolved*, That the Board of Trustees be urged to proceed to the clarification of these problems as requested by the House of Delegates at its last annual session

### Resolution on Medical Service Plans

Dr Charles E Mongan, Massachusetts, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations

WHEREAS, The House of Delegates of the American Medical Association in special session in 1935 stated that "it reaffirms also its encouragement to local medical organizations to establish plans for the provision of adequate medical service for all of the people, adjusted to present economic conditions, by voluntary budgeting", and

WHEREAS, The Delegates amplified this statement in special session Sept 16 and 17, 1938 with the restrictive remark that "In addition to insurance for hospitalization your committee believes it is practicable to develop cash indemnity insurance plans to cover, in whole or in part, the costs of emergency or prolonged illness", and

WHEREAS, Pursuant to this obligation thus imposed on state and county medical societies they have so acted as to warrant the report that "By the summer of 1941 there were twenty state medical societies that had taken some steps toward the introduction of a medical service plan to operate over the entire state" (1941 edition Organized Payments for Medical Services), and since nearly the entirety of effective organized and planned service schemes have utilized the principle of medical service contracts (California, Michigan, Buffalo, New York, North Carolina, Washington, Oregon, Pennsylvania, New Jersey, Massachusetts and others), and

WHEREAS, These major experimenting groups have not found it valid or practical for effectively aiding the lower income groups by restricting and restrictive statements relative to contracts coming from the House of Delegates (1938) as "Your committee urges the House of Delegates to suggest and recommend that the American Medical Association adopt the principle that in any plan or arrangement for provision of medical services the benefits shall be paid in cash to the individual member," and such statements as that from the resolution

publication 1941 Organized Payments for Medical Services page 21 that The attitude of the American Medical Association toward methods of payment of medical bills has been clearly defined. The position that benefits should be paid to the patients in cash in the same manner as premiums are collected from them is plainly stated and

WHEREAS The empirical findings of the major experimenting groups that a medical service contract best serves the end of a more adequate distribution of needed medical care in a manner which effectually protects the lower income groups against the mounting costs of medical care and is directly in record with the realistic attitude of the Massachusetts commissioner of insurance that the capital sustaining such plans with payments on the unit basis is not cash but the physician's service and

WHEREAS The statement of the House of Delegates Sept. 16 and 17, 1938 that "Your committee recognizes the soundness of the principles of the workmen's compensation laws" implies acceptance of the important compensation principle of arranging the delivery of complete service to the patient without additional charge by the doctor and with payment of the physician from insurance funds all of which is the essence of a medical service contract, he it therefore

Resolved That the state and county units of the American Medical Association in undertaking medical service plans at the behest of the parent organization will have their hand supported if medical service contracts as well as cash indemnity contracts are given equally frank direct approval by the House of Delegates

#### Resolution on Aid to Our Government

Dr Wells P. Eagleton, on behalf of the Medical Society of New Jersey, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations

Resolved That the Medical Society of New Jersey through and with the American Medical Association pledges its utmost and wholehearted support to the President and government of the United States in the successful prosecution of the war and the establishment of a new and better order for all peoples

The Medical Society of New Jersey is pleased to congratulate the American Medical Association for the aid it has given our government in the enlistment of physicians in our armed forces and for Civilian Defense as expressed in a letter by Assistant Secretary of War Patterson as recently published in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION

#### Resolution on Adequate Medical Care

Dr Wells P. Eagleton, for the Medical Society of New Jersey, presented the following resolution, which was also referred to the Reference Committee on Legislation and Public Relations

WHEREAS The Medical Society of New Jersey recognizes it is essential that adequate medical care be available to all our people and

WHEREAS The Medical Society of New Jersey recognizes that the importance of this problem will loom larger during the privations of the days to come, although the emphasis may wane with the distraction necessitated by war efforts and

WHEREAS The Medical Society of New Jersey believes that the organized medical profession should take the initiative in all matters pertaining to the health of our people and

WHEREAS The successful operation of the Emergency Relief Administration during 1933, 1934 and 1935 and the organization of the Medical Service Administration by the Medical Society of New Jersey may be a basis for and contribute to the formulation of a practical means of meeting this very difficult problem so that adequate medical care may be available to those of our people who cannot provide it for themselves therefore he it

Resolved That we believe and request that an adequate medical care plan be formulated without delay for all states, by joint action and agreement between representatives of government and the American Medical Association so that adequate care shall be available to those who wish to take advantage of it

#### Resolution on Women Physicians Obtaining Commissions in Medical Reserve Corps of United States Army and Navy

Dr Emily D. Barringer, for the Medical Society of the State of New York, presented the following resolution, which was referred to the Reference Committee on Military Preparedness

WHEREAS During the past winter women physicians have been denied commissions in the Medical Reserve Corps of the United States Army because of their sex and in spite of outstanding personal and professional qualifications as for instance in the case of a skilled anesthetist attached to a base hospital which was ordered into active service and in this case the colonel in charge and the chief surgeon highly endorsed and desired that this woman be a member of the staff of this base hospital and

WHEREAS During this past winter two American women physicians have received commissions in the Royal Army Medical Corps of the British Army, one as a major and the other as a lieutenant and both have been assigned to military hospitals and

WHEREAS The women physicians of the American Medical Association are a minority group who however pay dues and take part in the activities of the Association and turn to the Association for help in their problems of medical opportunities and

WHEREAS There is no existing ruling that women are ineligible to the Medical Reserve Corps of the United States Army while there

is an existing ruling in the Navy, which could be removed by the proper authorities and

WHEREAS At the last meeting of the house of delegates of the Medical Society of the State of New York the house went unanimously on record as approving that women physicians be admitted to the Medical Reserve Corps of the United States Army and Navy, and formally requested the American Medical Association to endorse that action which was not accomplished therefore be it

Resolved That the House of Delegates of the American Medical Association aid one of its minority groups by endorsing and aiding women physicians in obtaining commissions in the Medical Reserve Corps of the United States Army and Navy

#### Resolutions on Standards for Percentage Determination of Hearing Loss

Dr Burt R. Shurly, Section on Laryngology, Otolaryngology and Rhinology, presented the following resolutions, which were referred to the Reference Committee on Miscellaneous Business

Resolved That the Section on Laryngology, Otolaryngology and Rhinology has carefully considered the recommendation of the Council on Physical Therapy respecting standards for the percentage determination of hearing loss therefore be it

Resolved That the Section on Laryngology, Otolaryngology and Rhinology requests that the House of Delegates approve the said recommendation

#### Request That American Medical Association Inspect and Approve or Disapprove Present and Future Schools for Training of Medical Record Librarians

Dr W. A. Coventry, Minnesota, presented the following request, which was referred to the Reference Committee on Medical Education

Owing to the demand for trained medical record librarians, the American Association of Medical Record Librarians realizes the need for specially organized courses in this field. Ten such schools approved by the Association have been established. These approved schools can by no means supply a sufficient number of graduate record librarians. The needs are so great that other schools must be approved.

It is of deepest concern to us, however, that this increase in schools shall not lower the educational standards which the American Association of Medical Record Librarians requires. Our Educational Board enjoys the privilege of having among its members a representative of the American College of Surgeons, the American Hospital Association and the American Medical Association. The contribution made by these experienced men has been of great value. We now wish to go a step further. We earnestly desire that the American Medical Association inspect all present schools and all future schools for training of medical record librarians and after inspection either approve or disapprove the schools.

Furthermore, we ask that schools for medical record librarians approved in this manner be listed in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION.

#### Resolution Requesting Approval of Principles of American College of Apothecaries

Dr Joseph F. Smith, Wisconsin, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business

WHEREAS The American College of Apothecaries a national non-profit organization founded for the promotion of public health by education, distribution of pharmaceutical information and encouraging interest in prescribing to lessen the danger of self-medication and

WHEREAS This organization through its policies and objectives promotes a better relationship between medicine and pharmacy and

WHEREAS It is an affiliate of the American Pharmaceutical Association and its members must hold membership therein and

WHEREAS Its membership is limited to professional pharmacists hospital pharmacists and faculty members of schools of pharmacy and

WHEREAS Each pharmacy owned and operated by a fellow of the American College of Apothecaries must comply with the following requirements

(a) Each pharmacy exterior or window shall not display any signs of cigarettes, cigars, tobacco, liquor, beverages, food or ice cream. The pharmacy must not display either inside, outside or in the windows of the pharmacy any advertising material which detracts from the professional appearance of the pharmacy or suggests self-medication.

(b) The general appearance both exterior and interior of the pharmacy shall be one of cleanliness and order. The pharmacy shall be such as to make it predominantly apparent to the public that it is a pharmacy. It shall be well lighted and ventilated and the prescription laboratory shall have a professional atmosphere. There shall be no lotteries or gambling devices on the premises.

(c) There shall be a registered pharmacist on duty at all times that the pharmacy is open for business, and

WHEREAS, Serving of meals and lunches, and the sale of any product that might reflect on pharmacy as a profession is prohibited, therefore be it

*Resolved*, That the House of Delegates of the American Medical Association go on record approving the principles of this organization, which is sincere in the endeavors (1) to advance the standards of pharmacy, (2) to secure better cooperation between physician and patient, (3) to stimulate greater interest in public health and welfare and (4) to offer a better pharmaceutical service to physician and patient

#### Presentation and Address of Dr T C Routley

Dr Olin West, Secretary, introduced to the House Dr T C Routley, fraternal delegate from the Canadian Medical Association, who addressed the House as follows

*Mr Speaker, Dr West, Members of the House of Delegates of the American Medical Association* Once again it is my very happy privilege to bring you the fraternal greetings of the Canadian Medical Association

Nineteen years have elapsed since this great honor was accorded me, as I have told you on other occasions. If I keep this up for two more years, I am going to apply to you for a right of way over this highway, which cannot be blocked after twenty-one years—at least that is so in my country

Unfortunately, as Dr West has told you, my own meeting begins two days hence, and I must be on my way. We are hoping that many of your members of the western states who have not found it convenient to come to your meeting may come over to us at Jasper, where I can assure you a very hearty and cordial welcome awaits them

On the last two occasions on which I have appeared before you I have been asked a number of times how long I thought England could hold out against the enemy. That reminds me of a story. It appears that at least once a year Sandy and Angus had a game of golf. On this occasion it was a cold day when they went out to play. It seemed to necessitate a little bit of warming up in the clubhouse, so they had a nip from the bottle. On the first tee, while they waited to drive off, they thought it was an occasion for another little nip from the bottle. On the first green they each had a five and of course that was an occasion for celebration, so they had another little nip from the bottle. Thus it went from tee to green and green to tee until they reached the sixteenth hole. Finally Angus, turning to Sandy, said "Sandy, how do we stand?"

"Well, I don't know," he said, "It's a miracle"

It may be, ladies and gentlemen, that when England was standing alone she was standing because of a miracle, perhaps because of a Divine Providence, who knows. But the fact remains that she stood, thank God!

I do recall on that memorable meeting between Mr Churchill and the prime minister of France, when France was just on the verge of falling, the prime minister of France said to Mr Churchill "Now what are you going to do?"

"Well," he said, "we will fight on, we will fight on in the streets, we will fight on in our homes, we will fight on until there is nobody left. But," he said, "there is one thing I can assure you. No matter what happens in England, England will go on forever and forever and forever and forever"

Mr Speaker, since I last had the honor of coming to you, great changes have taken place. We no longer think in terms of miracles. We can see a glimpse of the future, and, no matter how long the struggle may be, medicine in this great North American continent, you and we, are going to play our part to the end of the struggle, and I am confident, as I am sure that you are, that your way of life and our way of life will survive and go on forever and forever and forever

#### Resolutions on Elimination of Requirement of Certification of Checks for Purchase of Special Tax Stamps in Connection with Dispensing of Opium

Dr James R Reuling, New York, presented the following resolutions from the Medical Society of the State of New York, which were referred to the Reference Committee on Miscellaneous Business

WHEREAS, The physicians and surgeons who dispense or prescribe opium or coca leaves or any compound manufacture, salt, derivative or preparation thereof are required by federal law and regulations annually to purchase a special tax stamp for \$1, and

WHEREAS, When payment of such dollar is made by check it is required that such check be certified by the bank of payment, and

WHEREAS, The Treasury Department of the United States of America accepts checks for larger amounts without requiring certification, and

WHEREAS, The Medical Society of the State of New York has protested against the requirement that checks in payment of these special tax stamps be certified by the bank of payment, and

WHEREAS, Members of dentist, veterinary, pharmacist, manufacturing chemist and banker organizations are also affected by the unnecessary labor of certification of small checks, therefore be it

*Resolved*, That the American Medical Association take emphatic and persistent steps for the elimination of the requirement of the certification of checks for purchase of special tax stamps in connection with the dispensing of opium or coca leaves or any compound, manufacture salt, derivative or preparation thereof, and be it further

*Resolved*, That copies of this resolution be sent to important national dentist, veterinary, pharmacist, manufacturing chemist and banker organizations

#### Resolutions on Approval of Activities of National Physicians' Committee for the Extension of Medical Service

Dr Thomas A McGoldrick, New York, presented the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations

WHEREAS, The physicians of the United States, through the American Medical Association, unselfishly have devoted time, energy and continuously greater ability to building an organizational structure truly nationwide in scope, serving every town, village and hamlet in this country and devoted to the vital task of providing a more effective and a more generally available medical service than is provided anywhere else in the world, and

WHEREAS, These efforts, over a period of nearly one hundred years have developed American medicine to the point of a general recognition of its worldwide leadership, and

WHEREAS, This unparalleled growth and this unusual effectiveness are the results of the high level of educational requirements, the high standard of ethics that has been maintained and the continuous safe guarding of the relationship between the physician and the patient, and

WHEREAS, We are now passing through a period of worldwide revolutionary change in social, economic and philosophic concepts, and the general public has been and is subjected to a vast educational propaganda some of which tends to discredit the American doctor and to destroy confidence in the effectiveness of American medicine and in our system of distributing medical care, and

WHEREAS, Preservation of the vital principles responsible for medicine's past progress, its present effectiveness and its ability to serve the public most advantageously make it essential that citizens understand the basic facts in connection with American medicine's methods, growth achievements, the factors responsible for its superiority and the extent to which the people have been the beneficiaries of the profession's intensive and constructive efforts, therefore be it

*Resolved*, That we register our approval of the activities of the National Physicians' Committee for the Extension of Medical Service commend the board of trustees and the management of that institution for the efforts they have made to enlighten the general public in connection with American medicine's methods, progress and achievements and in pointing out that the public has a vital interest in the final result, and be it further

*Resolved*, That it be declared the policy of this House of Delegates to encourage this effort and similar efforts with identical purposes

#### Resolution Requesting Change in Social Security Act

Dr Walter W Mott, New York, presented by title a resolution requesting change in the Social Security Act, which was referred to the Reference Committee on Executive Session

#### Presentation of Men in House Who Had Not Served Previously

Dr H H Shoulders, Speaker, called on associates of each delegate who had not previously served in the House to present such new members. The following new delegates and visitors were presented: Dr F H Douglass, Washington, Dr John M Emmet, Virginia, Dr Warren L Allee, Missouri, Dr John T Donovan, New York, Dr Marion C Pruitt, Georgia, Dr Harry V Paryzek, Ohio, Dr George A Woodhouse, Ohio, Dr A H Stewart, Pennsylvania, Dr Dwight L Wilbur, California, Dr William A Mulherin, Georgia, Dr B F Pratt, Texas, and Dr Henry N Tihen, the president of the American Medical Society

The House recessed at 1 35 p m to meet again at 9 30 a m, Tuesday, June 9.

(To be continued)

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES NEW HOSPITALS EDUCATION AND PUBLIC HEALTH)

### CALIFORNIA

**Annual Meeting of Urologists**—The twentieth annual session of the Western Section of the American Urological Association will be held at Del Monte, June 22-24, under the presidency of Dr. Albert M. Meads, Oakland. Among the speakers will be

Dr. Laurence L. Howard, Great Falls, Mont., Double Kidneys and Double Ureters with Ectopic Ending of One Ureter  
Dr. Donald A. Charnock and William S. Riskaden, Los Angeles, Hypospadias  
Dr. Joseph F. McCarthy, New York, A Consideration of Essential and Accessory Equipment for Instrumental Operative and Diagnostic Urology  
Dr. Herbert M. Evans, Berkeley, Gonadotropic Hormones—Pituitary and Nonpituitary  
Dr. Miles Griffin, Oakland, The Case Against Transurethral Prostatic Resection  
Dr. Charles B. Huggins, Chicago, Endocrine Relationships of Prostatic Cancer

**Dr. Frank Lynch Retires**—Dr. Frank W. Lynch, since 1915 professor of obstetrics and gynecology at the University of California Medical School, San Francisco, will retire this year. A native of Cleveland, Dr. Lynch graduated at Johns Hopkins University School of Medicine, Baltimore, in 1899, serving there as assistant instructor and associate in obstetrics from 1900 to 1904. The following year he joined Rush Medical College, Chicago, as instructor in obstetrics and from 1909 to 1915 was assistant professor of obstetrics and gynecology. In 1924 he was chairman of the Section on Obstetrics and Gynecology of the American Medical Association. Dr. Lynch was president of the American Gynecological Society in 1933, of the San Francisco Obstetrical and Gynecological Society in 1930 and of the Pacific Coast Obstetrical and Gynecological Society in 1931. He is an honorary member of many groups concerned with his specialty and has written extensively on the subject. He is 71 years of age.

### ILLINOIS

**New Searle Pharmaceutical Laboratories**—G. D. Searle & Co., manufacturers of pharmaceuticals for more than fifty years, recently opened their new laboratories in a modern streamlined building in Skokie on the northwest limits of Chicago. The research laboratory, occupying almost the entire second floor, consists of three divisions, organic synthesis, bio-assay and analytical. The synthetic organic laboratories

New Laboratories of Searle & Co.

which occupy the largest area are separated by partitions of shatterproof glass to provide complete safety in case of fire or explosion. There are laboratories for bacteriology and pharmacology. The pharmacology department consists of three laboratories on the research floor directly connected with the animal rooms in the basement. The analytical division occupies the west wing of the research floor and includes an optical room and adjoining dark room. These have been joined because of the constant increase of new techniques and methods which employ optical and frequently photographic instruments for the perfection of the analysis, reduction of labor and precise measurement of smaller amounts of material. A large auditorium occupies the entire wing of the basement and will be

available to employees and to local medical societies. The general offices are located on the upper tier of the building. The building is air conditioned and humidity controlled throughout.

### Chicago

**Dr. Jacob Krafft Honored**—Dr. Jacob C. Krafft, clinical professor of pediatrics, Loyola University School of Medicine, was guest of honor at a dinner at the Hotel LaSalle, May 13, given by the Northwest Branch of the Chicago Medical Society and friends to honor his many years of service in the profession and in special recognition of his work in the care of the mentally handicapped child. Dr. Krafft was presented with a sphygmomanometer.

**Physician Denied Appeal in Draft Bribery**—The United States Supreme Court has denied the petition of Dr. Joseph P. Gardzielewski for review of his conviction on charges of aiding and abetting a local draft board chairman in taking a bribe from a draft registrant seeking deferment, newspapers recently reported. The physician and Joseph M. Nosek, the board chairman, were tried together and both were convicted. The physician received a two year prison sentence. His appeal was based on the contention that evidence was introduced at the trial that was applicable to Nosek's case but not to his own, thereby creating prejudice in the minds of the jury, it was stated. He was alleged to have suggested that the draft registrant might obtain a six month deferment by paying a certain sum to Nosek. The registrant was said to have reported the incident to authorities after conversations with Nosek and payment of \$35 to him. The newspapers further report that the case was the first to reach the Supreme Court in the administration of the Selective Service Act.

### IOWA

**Twin Lakes District Meeting**—The Twin Lakes District Medical Society will hold its annual dry diagnostic clinic and twentieth annual assembly at Rockwell City, June 25. Clinics will be conducted by the following: Drs. Thomas J. Dry, Rochester, Minn.; James William Martin, Omaha, LeRoy H. Sloan, Chicago; John H. Randall, Iowa City; and James Dewey Bisgard, Fort Crook, Neb. Col. John I. Marker, Cedar Rapids, will discuss "The Medical Man and the Armed Services" and Drs. Frank P. Winkler, Sibley, and Robert L. Parker, Des Moines, president and secretary respectively, of the state medical society, "The Iowa State Medical Society in War Time." The Twin Lakes district consists of the following counties: Buena Vista, Crawford, Calhoun, Carroll, Greene, Hamilton, Humboldt, Ida, Sac, Kossuth, Pocahontas, Webster and Wright.

### MINNESOTA

**State Medical Meeting in Duluth**—The Minnesota State Medical Association will hold its eighty-ninth annual meeting at the Duluth Armory, June 29-July 1, in Duluth, with headquarters at the Hotel Duluth, under the presidency of Dr. Herbert Z. Giffin, Rochester. The program will include the following speakers:

Dr. Armand J. Quick, Milwaukee, Present Status of the Hemorrhagic Diseases  
Dr. Archibald L. Hoyne, Chicago, Modern Methods of Control for Measles, Scarlet Fever and Diphtheria  
Dr. Willard E. Knapp, Dr. John F. M. Pohl and Lillian A. Hubner, R.N., Minneapolis, An Evaluation of the Kerner Technique of Treatment for Poliomyelitis  
Dr. Anton J. Carlson, Chicago, Some Unknowns in the Pathologic Physiology of Aging  
Dr. Paul H. Holinger, Chicago, Esophageal Diseases  
Dr. Ferdinand H. Haessler, Milwaukee, Ocular Tuberculosis  
Dr. John R. Lindsay, Chicago, Meniere's Disease

There will be clinical pathologic conferences and symposiums on obstetrics, virus diseases, newer therapeutic measures, anesthesia, the use of blood substitutes, emergency surgery, tuberculosis and diseases of the eye, ear, nose and throat. Among the speakers at the round table luncheons will be Col. Fred W. Rankin, Lexington, Ky., President of the American Medical Association on "Colon Surgery"; Dr. William C. Keettel, Jr., Madison, Wis., "Treatment of Prolonged Labor"; and Drs. Ernest L. Veland and Charles D. Creevy, Minneapolis. Obstruction of the Vesical Neck. On Wednesday afternoon there will be an industrial health and safety conference with the following speakers:

Dr. Carl M. Peter, Chicago, The Doctor in Industry's War Effort  
Dr. Leslie W. Foker, Minneapolis, Minnesota's Industrial Health Program  
Dr. Frank J. Elias, Duluth, Prevention and Treatment of Heat Collapse Among Industrial Workers  
Austin F. Henschel, Ph.D., Minneapolis, Diet and Fatigue  
Dr. Robert F. McGandy, Minneapolis, First Aid to Injured Workmen  
Mr. A. A. Wolf, St. Paul, What the Medical Profession Can Do to Increase Safety and Health in War Industries

Dr Arthur C Christie, Washington, D C, will deliver the Russell D Carman Memorial Lecture Tuesday afternoon on "Diagnosis and Treatment of Bronchiectasis." At the annual banquet Tuesday evening the speakers will be Dr Carlson on "Black Oxen and Toggenburg Goats" and Colonel Rankin, "The Challenge of the War to American Medicine." On this occasion the Southern Minnesota Medical Association Medal will be presented.

### MONTANA

**State Medical Meeting**—The sixty-fourth annual meeting of the Medical Association of Montana will be held in Missoula, July 8-10. The speakers will be

Dr Lawrence R Boies, Minneapolis, Headache

Dr George J McHaffey, Billings, Pathology of Silicosis and Silico tuberculosis

Dr Frank I Terrill, Deer Lodge, Clinical Aspects of Silicosis and Silicotuberculosis

Dr Henry K Ransom, Ann Arbor, Mich, Fundamental and Clinical Considerations in Intestinal Obstructions

Dr Norman F Miller, Ann Arbor, The Human Cervix in Health and Disease

Dr Cyrus C Sturgis, Ann Arbor, Coronary Thrombosis Discussion of Some of the Errors of Diagnosis

Howard B Lewis, Ph D, Ann Arbor, Fortification and Enrichment of Foods, and Nutritional Significance of the Vitamins

Dr Jerome P Nesselrod, Evanston, Ill, Is Rectal Cancer Preventable?

There will be panel discussions on diseases of the rectum, management of perforated appendix, pelvic disease in the female, diseases of the blood, and vitamins. Drs Nesselrod and Jay M Garner, Winnetka, Ill, will present a film on "Proctoscopic Color Photography."

### NEW HAMPSHIRE

**State Medical Election**—Dr Timothy F Rock, Nashua, was chosen president of the New Hampshire Medical Society during its annual meeting in Manchester, May 12-13. Dr James W Jameson, Concord, was named vice president and Dr Carleton R Metcalf, Concord, was reelected secretary-treasurer.

### NEW MEXICO

**State Medical Meeting in Santa Fe**—The annual meeting of the New Mexico Medical Society will be held at the La Fonda Hotel in Santa Fe, June 25-27, under the presidency of Dr Carl Mulky, Albuquerque. The speakers will be

Dr Thomas D Cunningham, Denver, Allergy and Acute Disturbances of the Gastrointestinal Tract

Dr William W Haggart, Denver, Surgical Treatment of Acute Conditions of the Abdomen

Dr George P Lingenfelter, Denver, Skin Diseases Under War Conditions

Dr Franklin G Ebaugh, Denver, Prevalent Personality Problems of Childhood and Adolescence

Dr James B Walton, Denver, Treatment of Pylorospasm

Dr Gerrit Heusinkveld, Denver, Modern Concepts of Ovarian Surgery

Dr Robert G Packard, Denver, General Considerations in the Treatment of Malunited and Nonunited Fractures

Dr Andres Ferret, Silver City, Osteomyelitis of the Skull

Dr Meldrum K Wylder, Albuquerque, Adequate Nutrition for Children During War Period

Dr Albert W Egenhofer, Santa Fe, Eye Conditions of Interest to the General Practitioner

Mr Harvey T Sethman, Denver, Procurement and Assignment Service

There will be a round table luncheon on Thursday and on Friday with the following speakers: Dr Cunningham, allergy; Dr Haggart, surgery; Dr Heusinkveld, obstetrics; Dr Ebaugh, psychiatry; and Dr Packard, orthopedics.

### NEW YORK

**Medical College Changes Entrance Date**—Albany Medical College announces that at a recent meeting of the faculty it was decided to admit a freshman class on July 13 and the next one March 29, 1943.

**Scarlet Fever Quarantine Abandoned**—The state sanitary code was amended, April 1, to provide for the discontinuance of placarding and quarantining of premises for scarlet fever, although isolation of the patient and personal quarantine of household contacts remain unchanged. German measles or rubella and Vincent's angina have been removed from the list of reportable diseases, also effective April 1. The *Bulletin* of the Onondaga County Medical Society and the Syracuse Academy of Medicine points out that in the case of the measles no effective control measures are available and the reporting does not serve a sufficiently useful purpose to justify the time and expense involved in the tabulation of numerous reports. Vincent's angina has been removed from the list because, with the practical eradication of diphtheria, there isn't the likelihood of confusing the diagnosis with that of diphtheria.

**Maternal and Child Welfare Teaching Day**—The state department of health and the Medical Society of the State of New York sponsored a regional maternal and child welfare

teaching day at the Westchester Country Club, Rye, May 20, in cooperation with the Dutchess, Orange, Putnam, Rockland and Westchester county medical societies. The afternoon program included the following speakers: Drs Vincent P Mazola, Brooklyn, "Complications of Pregnancy Heart Disease, Tuberculosis and Diabetes"; Charles A Weymuller, Brooklyn, "Newborn Apnea and Resuscitation Causes, Treatment, After Effects on Child," and Charles A Gordon, Brooklyn, "Procedure for Study of Maternal Deaths." The evening program was addressed by Drs Philip Levine, Newark, N J, "Importance of RH Factor in the Blood Its Effects on Transfusion Reactions, Erythroblastosis, Miscarriages and Stillbirths" and William E Studdiford Jr, "Chemotherapy."

### New York City

**Lectureship Named for Dr Niles**—Tau chapter of Nu Sigma Nu fraternity at Cornell University Medical College has voted to name its annual lectureship for Dr Walter L Niles, dean of the college for many years and acting dean at the time of his death in December. A fellowship in the department of medicine at Cornell also has been established in Dr Niles' memory.

**Training in Physical Therapy**—Columbia University announces a program of professional studies for the training of physical therapy technicians to begin in September and to extend over a two year period. The clinical and laboratory instruction will be given at the Vanderbilt Clinic, Neurological Institute, Presbyterian Hospital and the New York Orthopaedic Dispensary and Hospital. Two years and sixty semester hours of college, including courses in physics and biology, shall be required or graduation from an accredited school of nursing or an accredited school of physical education.

**Bust of Henry Fairfield Osborn**—The unveiling of a bust of the late Henry Fairfield Osborn, Sc D, for many years president of the American Museum of Natural History, was a feature of the official opening of the Hall of North American Mammals at the American Museum of Natural History, April 8. The acting president, A Perry Osborn, son of Professor Osborn, presided. The career of Professor Osborn was summarized by William K Gregory of the museum and James Rowland Angell, formerly president of Yale University. The bust was unveiled by Professor Osborn's daughter, Mrs Jay Coogan. Announcement was made during the ceremonies of the receipt of a \$500,000 fund from the estate of the late Henry Robinson Towne. This sum will be added to the general endowment and will be used to carry on research on animal behavior and similar fundamental problems. The Hall of North American Mammals is to contain twenty-nine groups, of which eleven have been completed. Dr Osborn died on Nov 6, 1935, aged 78. In 1890 he became professor of biology at Columbia University, where from 1910 until his death he was research professor of zoology. In 1891 he became curator of the department of vertebrate paleontology at the American Museum of Natural History.

### NORTH CAROLINA

**New Public Health Officers**—Dr Nathaniel Thomas Ennett, Greenville, was elected president of the North Carolina Public Health Association at its annual meeting in Charlotte, May 14. Dr William P Richardson, Chapel Hill, was named vice president and Dr Clem Ham, Monroe, secretary-treasurer to succeed Dr Ralph J Sykes, Raleigh.

**State Medical Election**—Dr James W Vernon, Morganton, was chosen president-elect of the Medical Society of the State of North Carolina and Dr Donnell B Cobb, Goldsboro, was installed as president. Other officers include Drs George S Coleman, Raleigh, and Julian A Moore, Asheville, vice presidents, and Roscoe D McMillan, Red Springs, secretary-treasurer.

**District Meeting**—The Eighth District Medical Society was addressed in North Wilkesboro, April 21, among others, by Drs Robert J Lovill, Mount Airy, on "Nutrition Deficiencies and Diseases of Infancy and Childhood"; Charles H Mauzy Jr, Winston-Salem, "Recent Advances in Prenatal Care"; Sidney F LeBauer, Greensboro, "Rheumatic Fever Diagnosis and Treatment"; George W Joyner, Asheville, "Parathyroid Tumors," and Tinsley R Harrison, Winston-Salem, "The Nervous Heart."

**Activities at Bowman Gray School of Medicine**—Dr Frederick R Taylor has been promoted to associate professor of clinical medicine at the Bowman Gray School of Medicine, Winston-Salem, and Dr Wilbur C Thomas to assistant professor of pathology. According to the dean, Dr C. C. Cr

penter gifts, grants and other financial assistance amounting to \$451,110 were received during the year. Three members of the Bowman Gray family, Mrs B F Bernard, Mr Bowman Gray Jr and Mr Gordon Gray, provided \$409,700 of the total. Beginning with the new academic year June 29 instruction will be offered to three classes—freshman sophomore and junior. A new class will be added March 22, at which time, through the promotion of the junior class, the work of the senior class will also be added.

## OHIO

**Brush Foundation Receives \$250,000**—An anonymous donor has given \$250,000 to the Brush Foundation, Western Reserve University School of Medicine, Cleveland for the research and educational work of the foundation under the supervision of William Walter Greulich, PhD, director of the foundation and professor of physical anthropology and anatomy in the medical school.

**Zoologist Honored**—Raymond C Osburn, PhD, Columbus, was guest of honor at a dinner, May 11, given by friends, students and associates to mark his impending retirement as chairman of the department of zoology and entomology at Ohio State University, Columbus, a position he has held for twenty-five years. He was presented with a bound volume of letters from present and former students and colleagues. Dr Osburn received his degree in philosophy at Columbia University, New York, in 1906. At one time he served as lecturer in biology and embryology at Starling Medical College, Columbus, professor of biology at Fargo (North Dakota) College, assistant professor at Barnard College, Columbia University, New York, professor of biology at Connecticut College for Women, New London, Conn. He has also served as scientific investigator at the U S Bureau of Fisheries, Woods Hole Station, Woods Hole, Mass.

## PENNSYLVANIA

**Meeting of Ophthalmologists**—The first annual meeting of the Eastern Pennsylvania Association of Eye, Ear, Nose and Throat Physicians was held at the Schuylkill Country Club near Pottsville, April 29. The following officers were elected: Drs James E Landis, Reading, president, Charles L Fackler, York, vice president, and Sterling F Mengel, Pottsville, secretary-treasurer. The speakers at the meeting were:

Dr Benjamin F Souders, Reading, Ocular Absorption of Certain Sulfonamides  
Dr Thomas R Gagon, Pittston, Ocular Signs of Myasthenia Gravis and the Prostagmin Test  
Dr Horace J Williams, Philadelphia, Infections of the Orbit  
Dr Douglas MacFarlan, Philadelphia, Deafness  
Dr Algermon B Reese, New York, Practical Ophthalmological Therapeutics  
Dr Samuel R Kaufman, Wilkes Barre, Allergy of the Eye, Ear, Nose and Throat

### Philadelphia

**Personal**—Dr Esmond R Long, professor of pathology, University of Pennsylvania School of Medicine, and director of the laboratories of the Henry Phipps Institute, has recently been elected an honorary member of the Society for the History of Medicine, Buenos Aires, Argentina.

**Society Starts Plan to Examine Members**—A special committee appointed by the Philadelphia County Medical Society is in operation to provide for periodic health examinations of its members, according to the society's weekly bulletin. Examinations will be complete and will include laboratory studies, roentgenology and electrocardiography. Members may select their various examiners from panels of cooperating physicians and all data will be secret. The only cost for the entire program will be a registration fee of \$2 to cover extra clerical help. Examinations will begin as soon as 200 members have enrolled.

## TEXAS

**Study on Diseases of the Chest**—The State Tuberculosis Sanatorium is sponsoring lectures and clinical demonstrations in diseases of the chest for physicians in the state during June and July. There are no fees and the physician may remain as a guest of the hospital for two weeks. Material will be available concerning all phases of diagnosis and treatment of adult and childhood tuberculosis. Various nontuberculous conditions will be presented for study and comparison. Any physician licensed to practice medicine in the state of Texas may attend. Additional information may be obtained from Dr Joseph B McKnight at Sanatorium, Texas.

## WISCONSIN

**Lectures by Dr Heidelberg**—The Wisconsin Alumni Research Foundation sponsored two lectures by Michael Heidelberg, PhD, associate professor of biochemistry, Columbia University College of Physicians and Surgeons, New York, on May 7 and 8. His subjects were "Modern Concepts in Immunity" and "The Part of Chemistry in Their Development."

**Changes in Health Officers**—Dr Glenn V Hough, Milwaukee, has been appointed medical director of the Marathon County Health Unit, succeeding Dr Ernest Newman, Wausau, who has a similar position at Las Vegas, Nev.—Dr Errol V Brumbaugh, Milwaukee, has been appointed health commissioner of West Allis, filling the vacancy that occurred when Dr Frank H Russell, West Allis, recently resigned.—Dr Frederick P Knauf, Kiel, has been appointed city health officer of Kiel to fill the unexpired term of the late Dr George Mathes, who resigned shortly before his death, February 19, after holding the position since 1900.

**Meeting of Tuberculosis Specialists**—A meeting of the Wisconsin and Michigan Trudeau societies in Pembine was addressed, June 12-13, by:

Drs Henry E Cope and Christopher J Stringer, Lansing, Mich, Sputum Examination Methods  
Drs Anthony V Cadden, Wausau, and David Salkin, Hopemont, Wis, Preliminary Report on a Large Series of Routine Admission Bronchoscopies  
Dr Charles R Smith, Houghton, Mich, Treatment with Minimum Hospitalization  
Dr William H Oatway Jr, Madison, Wis, Mechanical Aids in Collapse Therapy  
Drs John F Sanders, Hawaii, and John B Barnwell, Ann Arbor, Mich, Perirectal Abscess and Fistulas  
Dr William M Tuttle, Detroit, Mich, The Present Status of Extrapleural Pneumothorax  
Dr John D Steele Jr, Milwaukee, Wis, Experience with the Monaldi Method of Cavity Drainage.

One session was devoted to a symposium on the value and significance of positive gastric lavages in the diagnosis and treatment of pulmonary tuberculosis.

## GENERAL

**Medical Kits Stolen**—H J Anslinger, Washington, D C, commissioner of narcotics, is asking physicians to cooperate in curbing the theft of medical kits from unlocked automobiles and points out that the number of medical kits stolen by addicts to obtain narcotic drugs is rapidly increasing and that many of these thefts have occurred in unlocked automobiles. In April eleven kits were stolen from automobiles of physicians within the city of Los Angeles and neighboring communities.

**Survey of Errors in Causes of Death**—Kurt Pohlen, PhD, and Dr Haven Emerson, New York, are making a survey of the amount of errors in certification of causes of death, working with records of autopsies. Clinical findings and opinion have been compared with the postmortem protocols of the same cases. The study and collection of data are under the auspices of the joint committee on autopsies of the American Public Health Association and the American Hospital Association. The study ultimately will include 100,000 cases.

**Special Society Elections**—Dr Lewis J Moorman, Oklahoma City, was chosen president-elect of the National Tuberculosis Association at its meeting, May 8, and Dr James Burns Amberson Jr, New York, was installed as president. Dr Charles J Hatfield, Philadelphia, was reelected secretary. At the annual meeting of the American Branch of the International League Against Epilepsy in Boston, May 18, the following officers were elected: Dr Wilder G Penfield, Montreal, Canada, president, Dr Charles D Aring, Cincinnati, vice president and Dr Frederic A Gibbs, Boston, secretary-treasurer.

**Registration of Diathermy Apparatus**—The application form to be used in registering diathermy apparatus should be filled out promptly, all information pertinent to the particular case being given and then mailed to Mr T J Slowie, secretary, Federal Communications Commission, Washington, D C. If the application is satisfactory, the commission will send the applicant a certificate of registration which must be affixed in a conspicuous place to the diathermy machine to which it pertains. The certificate may be attached to the machine by means of mastic, cellulose tape or any adhesive material so long as the printed matter is plainly visible. Attention is called to the necessity of having each unit of diathermy apparatus in one's possession separately registered. Consequently, it must be clearly understood that one application form is to be used for only one unit. If the applicant has other units he should indicate how many and application forms will be sent for each one. The term "diathermy" is intended to include medical and surgical diathermy. Possession of an electric knife involves

the following principles to determine whether such knife should be registered. If the knife is an attachment of a diathermy machine, there is no need for a separate registration of the knife, since the radio energy generating apparatus will already be registered. If, however, the knife is not used in connection with or as a separate attachment to a diathermy unit, and if its radio energy generating apparatus is employed solely as an aid to surgical use, the knife should be registered. In effect, this means registering a diathermy unit which is used exclusively for surgical purposes. If the mechanism of a knife is not capable of generating radio frequency energy it need not be registered.

If a unit of diathermy apparatus which has been registered is ever transferred to the possession of another person, even for a short time, the person who takes possession must apply for a new certificate of registration. If the owner transfers, sells, assigns, leases or lends the registered apparatus, or if it is ever lost or stolen, such fact should be immediately communicated to the commission. In those cases in which there is a transfer of possession and the certificate of registration is not stolen or destroyed, such certificate should be returned to the commission. The commission should also be notified of any change in location of the apparatus. This registration does not apply to x-ray machines, sun lamps, infra-red lamps or ultraviolet ray devices.

**Public Health Under Hitler's Rule**—The *Nieuwe Rotterdamsche Courant* of April 14 writes that there must be a drastic overhauling of the methods of training physicians. "The whole medical education must be revised and given another spirit. The medical problem is not the treatment of a sick individual, dissociated from his environment, but the combating of the illness of a member of the community, which is paid by the community, ordered by the community and responsible to the community. The state cannot allow such an important class as the medical class, which holds in many ways a key position in the new society, to remain apart from the community and to be kept apart because the medical teachers fail to appreciate their vocation. New teachers must be carefully chosen, because they must be fit to educate the new generation of physicians in the principles of the physicians' new communal task in every sphere of medical science."

*L'Oeuvre* of April 19 states that "the discontent of the medical profession cannot be denied. Many of the members of the Council of the Order, themselves—with the exception of a few young men somewhat prematurely appointed, won over from the start to the methods of the iron fist and favoring authoritarian decisions—view with some disquiet the upsetting of professional traditions which were a guaranty for the patients as well as for the physician and which it is not enough to call 'routine' to render ineffective. There is no art in which it is more necessary to have long experience before passing judgment. The decrees which Vichy produces each day by the dozen, replacing the unwritten laws, are particularly severe for the medical profession. New tasks are perpetually being imposed while its independence and possessions are ceaselessly diminishing. If there is any need to reduce the gasoline ration, the authorities take care not to tamper with the rations of the black market or of private cars which still take women and children for rides in Paris, but the cars of the country doctors are the first to suffer. And the last possessors are made to become co-proprietors of their car, regardless of whether the doctor they share with has the same rounds or not. As for the patients, who cares? One would like to know the bureaucrat who conceived this bright idea. The obligatory contributions for family allowances are three times as much for the medical profession as for any other. Why? Because the state subsidizes all other funds except those of the physicians. Why this exception? And the physician is now inflicted with far more graceless tasks than ever before. Medical certificates are perpetually in demand for the diets of his patients, for the wood and coal rations of old people and for the layettes of newborn babies. When the physician comes home, tired out with long walks and climbing innumerable staircases, he is faced with reams of clerical work, with all the certificates which await him. He also is responsible for all prophylactic measures against infectious disease and for the keeping up to date of statistics at the health services of the prefecture. He is now asked to point out to these same services those of his patients suffering from venereal diseases. The whole medical profession has risen in arms over this point, such a request to denounce one's patients being in fundamental opposition with the principle of professional secrecy. However lofty the motives of the venereal specialists in their fight against this disease, even though this denunciation is made into a contribution to statistical work, even though it is restricted to such patients as

refuse to have intravenous injections over an indefinite period, it is distasteful to all physicians to practice with their patients such methods as are used only in the barracks and the brothel. Besides, the patients are wary nowadays. They pay their fee in cash and do not give their names. And the doctor has no more right to ask for their names than the priest in the confessional. Is the medical profession still a liberal profession or is it to become a form of civil service?"

*DNB* of April 27 reports from Rowne that the German Sick Fund Institution for the Ukraine has been created for the reich Germans, who are carrying on their important work of reconstruction in the Ukraine, hundreds of kilometers from the homeland. Its task is to look after the maintenance of the health and the recuperation of all the reich Germans active in the Ukraine. Every reich German active in the reich commissariat of the Ukraine must contribute to this institution, if his income is under a certain amount, just as in the reich. In contrast with the reich, the Germans in the Ukraine are insured if their incomes are less than 600 marks a month, whereas in the reich the limit is 300 marks a month, this is because of the special importance of health conditions in the Ukraine area. Voluntary participation in the scheme is also possible. As double insurances are not permissible, those active in the Ukraine must have withdrawn from the sick funds to which they belonged in the old reich, but this withdrawal is only temporary. The membership of a sick fund in the reich lapses for the period of activity in the Ukraine.

The new institution will not be inferior in its benefits to any similar institution in the reich. The contributions will be about as high as those in the reich. For those reich Germans who still draw their pay in the homeland, the contributions will be paid into the general sick fund of Katowice (Upper Silesia). Reich Germans in the Ukraine and their families in the reich will each receive a certificate enabling them to go to any doctor according to the system of free choice of doctors. By the creation of this sick fund institution a great work has been started, and the social welfare of the reich Germans in the Ukraine in the field of health insurance has been assured.

The Swedish trade union paper *Fackforeningsrörelsen* of April 24, in an article on the German labor situation, states that various regulations have been published against taking sick leave, especially in the armament factories. Press campaigns and meetings explain that to take holidays because of sickness is paramount to treason. In this connection it may be mentioned that the health condition of the German people has already been largely undermined by many years' hard work. The *Reichsgesundheitsblatt* contains sensational figures about the registered cases of illness in the reich over a period of forty-eight weeks in 1939 and in 1941.

|               | 1939    | 1941    |
|---------------|---------|---------|
| Diphtheria    | 128 897 | 154 752 |
| Scarlet fever | 119 730 | 226 755 |
| Tuberculosis  | 69,502  | 88 312  |
| Paratyphus    | 2 648   | 3 800   |

During the first twenty-five weeks of 1939 there were 6,135 cases of dysentery against 12,705 during the same period of 1941. Similar figures are shown for whooping cough. Compared with the difficult years preceding national socialist rule, these illnesses increased by from 500 to 800 per cent. The difficult conditions in Russia must have caused even these figures to rise greatly last year.

To increase the capacity of overworked soldiers and workers more extensive use is being made of stimulants such as amphetamine. A luftwaffe doctor recently considered it necessary to issue a warning against such preparations in the *Deutsche medizinische Wochenschrift*.

Deaths in Other Countries

Sir Edward Coey Bigger, M D, Dublin, Ireland formerly medical commissioner of the Ireland Local Government Board, chairman of the Irish Public Health Council and crown representative for Ireland on the General Medical Council, died in Dublin, June 1, aged 81.

CORRECTION

Dr Stuart McGuire—Under Medicine and the War in THE JOURNAL, June 6, page 504, in the item "Medical College of Virginia Hospital Unit" it was stated that "During the first world war, Base Hospital No 45 was organized at the Medical College of Virginia under the leadership of the Dr Stuart McGuire." This information was taken from the Richmond, Va., *Times-Dispatch* of April 28. Dr Stuart McGuire of Richmond is still living and well at the age of 74.

### LONDON

(From Our Regular Correspondent)

May 2, 1942

#### Medical Reconstruction After the War

The Ministry of Health has appointed a committee of leading physicians and others to inquire into the organization of medical schools, particularly in regard to the facilities for clinical teaching and research and to make recommendations. The minister of health previously announced in the House of Commons that it will be the objective of the government as soon as may be after the war to insure that by means of a comprehensive hospital service appropriate treatment shall be readily available to every person in need of it. It is accordingly proposed to lay on the major local authorities the duty of securing in close cooperation with the voluntary agencies engaged in the same field, the provision of such a service by placing on a more regular footing the partnership between the local authorities and voluntary hospitals on which the present hospital services depend. The government recognizes that, to achieve the best results and to avoid wasteful multiplication of accommodation and equipment, it will be necessary to design such a service by areas substantially larger than those of individual local authorities. Patients will be called on to make a reasonable payment toward the cost, whether through contributory schemes or otherwise. In working out the details of the government's proposals special consideration will be given to the position of the teaching hospitals and to the question of assisting them by increased educational grants. This particular aspect of the future of hospital service is to be examined by the committee now appointed. The committee is not concerned with the curriculum for the training of medical students but with organization of medical teaching and its relation to the universities on the one hand and to the teaching hospitals on the other. It will consider such questions as the proper organization and distribution of medical schools, the appointment and remuneration of the teaching staff, the provision of an adequate range of cases for study and of suitable equipment, including the possibility of linking hospitals for teaching purposes and the organization of postgraduate teaching both for students specializing in some branch and for physicians wanting refresher courses.

#### Rehabilitation After Injuries to the Central Nervous System

At the Royal Society of Medicine, Prof. Geoffrey Jefferson opened a discussion on rehabilitation after injuries of the central nervous system. In a consecutive series of head injuries seen by him in private practice during the last two years the average time before specialist advice was sought was six months. Many cases were not seen until seven, eight or nine months after the injury. By that time a neurosis had been firmly established in a number of cases.

As to the validity of headache after a head injury, there are many doubters. We are learning about the mechanism of headache and are abandoning some time honored creeds notably the relation between pressure and headache as against local distortions of dural septums and traction on or pulsation of vessels. We do not with certainty know how to apply this knowledge except that we have comparative knowledge that pain continuing with unwavering intensity for months on end rarely has an organic cause. But we must beware of the danger of regarding all who have had a head injury as neurotic.

Rehabilitation after head injury includes (1) diversional and constructive occupations of sufficient variety and varying

degrees of difficulty for those still confined to bed as well as for the ambulant, (2) hospital maintenance work in the ward or outside, (3) physical therapy and (4) intellectual and recreational pursuits. There are two stages. The first stage covers the period in the hospital when the patient is confined to bed or ambulant and undergoing early treatment for the repair of his injury. The time at which the patient's interest is specifically aroused varies with the severity of the injury, the speed of recovery, the age and the intelligence. But rehabilitation in a diversional form should be instituted early while the patient is confined to bed and should take the form of reading or being read to, jigsaw, crossword and other puzzles, drawing or coloring, needlework, net and basket making, sewing, knitting and rug making. Physical therapy is provided for in all our brain injury centers.

The second stage begins some six weeks after the injury, when we should be in a position to gauge the prospects. The treatment will be in the main as in the first stage but with additions, such as gymnastics and physical training, speech training in cases of dysphasia, work in the garden, carpenter or engineer shop work, organized games (cricket, football, baseball), walks outside the hospital grounds, and visits to the town, the shops and the cinema.

#### How the People Are Fed

The distribution of food is controlled and rationed by the government. The minister of food has sent a personal letter of thanks to every executive food officer in which he says "It has been a year of many new ventures in food control, and all of them have demanded from your staffs hard work, patience and resource. Experience and elasticity are necessary for success in our great task of maintaining the health and courage of our people by keeping them adequately fed." There are fifteen hundred local offices or local ministries of food. Some idea of their work is given by a food officer in a typical borough in the London area. It is partly residential and partly industrial and has a population of one hundred and twenty thousand, which is served by one thousand food shops and six hundred catering establishments. There have been eighty-five thousand changes of address, and each takes about seven minutes to deal with. During the year the office has had to issue fifty-one thousand emergency cards for persons temporarily entering or leaving a district or who have lost their ration books. In addition, three hundred and sixty thousand ordinary ration books have been issued.

In a normal week never fewer than four thousand persons pass through the office with complaints or inquiries. These figures show how essential is full and harmonious cooperation between the public and the local food office. During the last three months there have been three thousand applications from persons wishing to change their retailers. Every person must be registered with one retailer, from whom alone they can obtain rationed foods. The applications to change were granted only when the reasons given were sound. To feed the one hundred and twenty thousand persons in the borough, the local food officer has to make available every week 6,000 pounds of meat, 20 tons of bacon, 20 tons of margarine, 12 tons of cooking fats, 46 tons of sugar, 4½ tons of cheese, 151,000 eggs (when they can be got) and 60,000 gallons of milk. This distribution of food is the most colossal undertaking ever attempted by one man. The food offices are ready for any emergency. If one occurred from extensive destruction in an air raid, the emergency feeding scheme could be put into complete operation at three hours notice. The food officer has for this purpose at least twice as much food as the Ministry of Food said he should have. When our war organization for this or other purpose is tested it will be found second to none and indeed more elastic and adaptable than the machine like method of

the Germans. They have had the advantage in the start, for we do not in time of peace make elaborate preparations for the destruction of other nations while lulling them into a sense of security by false assurances.

### Tuberculosis in the Merchant Navy

The need for mass radiography for the early detection of tuberculosis in adolescents has been pointed out by the president of the Royal College of Physicians and others. In a letter to the *Times* the management and medical staff of the Seamen's Hospital call attention to the need for this in the merchant navy and for the amelioration of living conditions on board ship, which, especially in wartime, are peculiarly favorable to the spread of infection. Statistics show that tuberculosis is among the highest causes of death among seamen. Moreover, the incidence is increasing under war conditions. The experience of the Seamen's Hospital Society over a long period, both at its hospitals and at its King George's Sanatorium for Tuberculosis, is that seamen do not present themselves for treatment until the disease has taken so strong a hold on them that prolonged treatment is required. The three main reasons for this are (1) lack of facilities for detection and control of the disease in its earliest stages, (2) the anxiety of the sailor lest during his treatment his wife and children should be inadequately provided for and (3) long voyages without any medical attention and the disinclination of seamen to undergo prolonged treatment in a foreign port. The sufferers are a grave source of infection to their fellows in the restricted quarters of a ship.

The signatories realize the difference between the use of mass radiography in the fighting services and in civil life and the practical difficulties peculiar to the mercantile marine. But they suggest that examination by miniature roentgenography should be included in the routine examination of seamen by the Shipping Federation, to other parts of which no objection is raised. Effective control would entail the institution of a personal record card. This might appear to differentiate merchant seamen from other workers, but a strong argument in its favor is that the migratory character of a sailor's employment deprives him of the contact with a panel or family physician which is available to landmen. Such a record could be incorporated in the seaman's discharge book and would be valuable to the physicians attached to the Seamen's National Approved Society in various ports.

### The Abdominal Surgery of Total War

The Bradshaw lecture on "The Abdominal Surgery of Total War" was delivered at the Royal College of Surgeons by Surgeon Rear Admiral Gordon-Taylor under war conditions. The college had been damaged in the indiscriminate bombing of London, so that the lecture room could not be used and the lecture was delivered in one of the museum rooms, which for safety have been emptied of their valuable contents. In the crowded audience, naval and military uniforms were prominent. The lecturer said that the most frequent cause of abdominal injury throughout the centuries was war. But heretofore the male was almost exclusively involved. Among the most primitive tribes a deliberate attack of man on woman is almost unknown. In the animal kingdom it is only on the rarest occasion that the male has made an onslaught on the female. This holds even for the fierce carnivora. But the miscreant nations who exultingly initiated the indiscriminate bombings of "total war" have destroyed the lives of countless women and children. After two and one-half years of total war we can take stock of our experience of abdominal injuries and compare our war surgery with that of the previous great war.

The lecture was based on a series of six hundred operations for abdominal injuries in casualties from Dunkirk, in the navy and the air force and among civilians during air raids. The

idea that the immediate mortality from abdominal injuries in war must be very high was not confirmed by the facts of the postmortem room. The immediate deaths due to abdominal injury were no more than 8 to 10 per cent of the total cases.

### PENETRATING INJURIES

In most of the penetrating abdominal injuries the projectile was a small fragment of bomb casing. The recovery rate was high when operation was prompt. Not only might the bowel be perforated by bullets, it might be scorched by incendiary bullets. The destructive effects of flying glass in air raids were now familiar. Coils of intestine were often cut to pieces inside the abdomen or hung out of gashes in the abdomen. Viscera might be damaged by driven fragments of bone although the missile did not penetrate the peritoneal cavity. As in the last war, the occasional immunity of viscera in penetrating wounds of the abdomen was observed. Also wounds of the hollow viscera occasionally recovered without operation. The importance of a buttock wound as leading to a track to the abdominal cavity was stressed. It was found in 20 per cent of all cases of abdominal injury. Hence the importance of not overlooking minute wounds of the buttock. The clothing should be removed and the patient examined all over. A case of large wound of the abdomen or of wide loss of abdominal wall was generally fatal.

### INTESTINAL INJURIES

Suture for wounds of the small intestine had a lower mortality than resection and should be preferred whenever possible. In resection the lecturer used end to end suture. Lengthy resections imply severe wounding and are not so promising as smaller ones. Yet 6 feet of small intestine has been removed with success and with cobbling of other injuries.

In wounds of the colon, suture should be combined with local chemotherapy. Colostomy sometimes proved valuable in the last war. If performed, it should be done early, before infection has secured a firm hold. Sulfonamide derivatives locally and orally have proved a valuable adjunct to surgery for patients with a damaged large intestine, and their use prophylactically is to be recommended. Resection of the colon is indicated in cases of infarction, extensive separation from the mesocolon, and where the viability of the intestine is destroyed or the wound is so large as to suggest formation of an artificial anus.

### INJURIES OF THE STOMACH

The prognosis of injuries of the stomach is better than in the last war. 60 per cent of recoveries as against 36.3. Acute dilatation of the stomach has been strikingly frequent in injuries, not only of the stomach but of other parts of the body. It has been observed in cases of severe contusion of the chest, fractured pelvis and ruptured bladder.

### THE EFFECT OF EXPOSURE TO BLAST

The direct effects of blast are experienced only close to the explosion, but the many indirect effects may produce death or serious injury. The intestine may show hemorrhages varying from hemorrhagic spots to large annular extravasations or even rupture of the bowel. The spleen may be torn. The liver may be bruised or torn, the kidneys and bladder are less often implicated. Blood clot has been seen in the peritoneum and retroperitoneal hematomas are characteristic, as well as effusions into the mesentery.

Abdominal injury due to blast in water ("immersion blast") was observed in the last war as well as in this war. It is produced by the near explosion of depth charges. Clinically the cases varied much in degree from mere ileus to severe peritonitis after rupture of the intestine. Hemorrhage into the nose and ears, hemoptysis, melaena and hematuria were observed.

#### THE RESULTS

In the lecturer's series of 163 operations for injuries of the large intestine there were 65 recoveries, in 119 operations on the small intestine there were 75 recoveries. Exteriorization operations on the large intestine did badly. Sulfonamide derivatives locally and orally proved of great value. Transfusion of blood or blood derivatives rendered a host of patients operable who otherwise would have perished.

#### BUENOS AIRES

(From Our Regular Correspondent)

April 18 1942

#### Failure of German Army Medical Service

The services of military hygiene and sanitation in the eastern German front were really deficient during the winter. The situation was aggravated because of the severity of the Russian climate and the appearance of infections in the military camps and also because of difference of opinion between the chiefs of the Nazi party and of the German army. General Dr Wolff, the highest chief of the German department of hygiene and sanitation, published an item at the beginning of the winter emphatically declaring that the medical and sanitary preparations for war on the eastern front were totally insufficient. Dr Wolff put the blame for the failure on Dr Conti, chief of German physicians, who during the courses on medical and sanitary preparedness gave more interest to ideologic teachings than to practical instruction. Dr Wolff asked the proper authorities for two changes in order to improve the courses of war medicine and war sanitation, namely (1) discontinuance of the ideologic courses of the Nazi party with the military and racial views of the party and (2) immediate rehabilitation of Jewish physicians for service on military sanitation. However, Dr Conti obtained support from the authorities for the refusal of Dr Wolff's first request. The second request was only partially accepted. Jewish physicians were rehabilitated for service as auxiliary physicians in civil hospitals but not in the army. Then the military commander "in revenge," mobilized all physicians up to the age of 60, and by this step the sanitary service of the reich was severely harmed. The failure of military sanitation is pointed out by Marshal Brauchitsch as one of the main causes for the retreat of the German army in Russia. Practically all the services of military sanitation are directed by the storm troops, which are those of Hitler's personal guard (S S). The sanitary situation at the front is grave. According to German reports the number of deaths from relatively slight wounds have increased because of the lack of a sufficient number of experienced surgeons. The number of cases of exanthematic typhus and of other infections has increased. Freezing has caused many more casualties than it caused during the war of 1914-1918. The cases of septicemia are also increasing.

#### New Building of Academy of Medicine

The National Academy of Medicine of Buenos Aires opened its new building on April 16. The academy was established in 1822, later it was united with the National Faculty of Medicine from which it was again separated in 1905. The work of the academy for the last few decades has been on the scientific rather than on the pedagogic field. The National Congress made of it an autonomous academy in 1925 in view of the efforts of Drs Eliseo Canton, Domingo Cabred and some other doctors. The scientific work carried on by the academy is of great importance. The new building was constructed with donations from the government and from Drs Rafael and Marcelino Herrera Vegas. The government made a donation of 2,000,000 pesos (\$500,000) to the academy. The beautiful building has several rooms, an assembly hall for eight hundred persons, laboratories and a library with twelve thousand books.

The Instituto de Investigaciones Físicas Aplicadas a la Patología Humana is a department of the academy. Dr Mariano R. Sastex is the head of the department.

#### Proceedings of Pan American Meeting

The Jornadas Neuro-psiquiátricas Panamericanas held its second reunion at Lima on March 20-25, 1939. The proceedings of that reunion were recently published in two large volumes. Drs Honorio Delgado and J. O. Trelles, professors of neuropsychiatry at the University of Lima, are the editors. The volumes contain important material on neurology, psychiatry and legal medicine which show the great progress of Latin American neuropsychiatrists. Some of the most important articles are on the variability of the cellular architecture of the cortex of the frontal lobe of the brain, pain from physiologic, anatomic, clinical, medicolegal and toxicologic angles, hypochondria, schizophrenia, social problems in relation to care of patients with mental diseases, biologic bases of civil incapacity of patients with mental diseases. The Tercera Jornada Neuropsiquiátrica Panamericana will be held at Buenos Aires in November with Dr Nerio Rojas as president of the reunion. Dr Nerio Rojas is a professor of legal medicine at the Faculty of Medicine of Buenos Aires.

#### Course on War Surgery

A course on war surgery was recently offered by the Facultad de Ciencias Médicas of Buenos Aires to physicians and youths in advanced studies of medicine. It began on April 16. Dr Alejandro Ceballos, professor of clinical surgery of the faculty, delivered a lecture on occasion of the opening of the course. The head of the University of Buenos Aires, several well known chiefs in the army and members of the profession attended the inaugural lecture, which dealt with the most modern treatments of wounds. The course is given as a measure of preparedness.

#### Personals

Prof. Dr. Eliseo B. Segura was appointed president of the National Academy of Medicine of Buenos Aires to succeed Dr. Mariano R. Castex, who recently resigned.—Dr. Eduardo Braun Menéndez of the Instituto de Fisiología de Buenos Aires, who recently lectured in the United States, was given an honorary degree of doctor of laws by the University of California.—Prof. Dr. Edgar Adrian of Cambridge lectured during March at the Academia Nacional de Medicina de Buenos Aires and at the Faculties of Medicine of Buenos Aires, La Plata and Rosario on neurophysiology. He also read papers before the Sociedad Científica Argentina, where he explained the problems of evacuation of children in London.—Dr. R. Castro O'Connor of Buenos Aires left Argentina for Great Britain recently to study plastic surgery. He will carry on his studies under the auspices of the Faculty of Medicine of Buenos Aires and the British Council. Dr. O'Connor will work in the clinic of Dr. Harold Gilhes.—Dr. George T. Pack of the Memorial Hospital of New York came to Argentina last April. Dr. Pack established a scholarship in the Memorial Hospital of New York for Argentinean physicians who wish to carry on special studies on cancer.—Dr. Juan Carlos Mujica, head of the general department of sanitation of the navy of Argentina, was appointed traveling delegate by the Pan American Sanitary Bureau. He will travel with Dr. John F. Long, the visiting inspector of the bureau, and will engage in studies on the prevention of pestilential diseases in Chile, Peru and Ecuador.

#### Brief Notes

There is typhus in almost all fighting fields in Europe. Therefore the general mail department of Argentina has established a service of disinfection of all mail from Europe with the aim of preventing typhus epidemics in this country.

## Deaths

**William P Wherry** ♂ distinguished as an ophthalmologist and otolaryngologist, one of the leaders of American medicine in this field, died at his home in Omaha, June 13, aged 61. Dr Wherry was born in Omaha, June 16, 1880. After attending preparatory schools in Omaha, he graduated from the University of Nebraska College of Medicine in 1903. He had been professor and chairman of the department of otolaryngology at the University of Nebraska College of Medicine and also a member and president of the staff of St Catherine's Hospital and the former Evangelical Covenant Hospital. He was a member of the medical staffs of the Union Pacific, the Chicago, St Paul, Minneapolis and Omaha and the Chicago and North Western railways.

Early in his medical career Dr Wherry became associated with organizational activities, having served as president of the Omaha-Douglas County Medical Society in 1919, of the Medical Society of the Missouri Valley in 1932 and of the Nebraska State Medical Association in 1941. He was chairman of the Section on Laryngology, Otology and Rhinology of the American Medical Association in 1934 and had been vice president of the American Laryngological Association, vice president of the Advisory Board for the Medical Specialties and secretary-treasurer of the American Board of Otolaryngology from the time of its foundation in 1924. He was also a fellow of the American College of Surgeons, the American Otological Society, the American Laryngological Association and the American Laryngological, Rhinological and Otological Society.

Dr Wherry gave especially of his time and energy to the work of the Omaha Mid-West Clinical Society, for which he had been treasurer since 1933, and to the American Academy of Ophthalmology and Otolaryngology. In this organization, which has done a monumental work in graduate instruction in its field, he was secretary of the Section of Instruction from 1920 to 1926, first vice president in 1924, executive secretary-treasurer since 1926 and editor of its *Transactions* and *Bulletin* since 1930. His interest in graduate medical education was significant, and he had served since 1938 on the Commission on Graduate Medical Education.

Dr Wherry had written many scientific contributions in the field of vision and on the pathology of the sinuses. He was widely known as a medical scientist, a teacher, a leader in public affairs and in education, a gentleman of charm and culture.

**Edward Joseph Ill** ♂ Newark, N J, College of Physicians and Surgeons, medical department of Columbia College, New York, 1875; past president of the Essex County Medical Society and the Medical Society of New Jersey, in 1893 vice president, in 1899 president and member of the executive council from 1901 to 1903 of the American Association of Obstetricians and Abdominal Surgeons, vice president for New Jersey of the Pan American Medical Congress in 1893, member of the Southern Surgical Association, chairman for the state of New Jersey of the American Society for the Control of Cancer, member of the board of governors of the American College of Surgeons, member of the board of education of Newark from 1878 to 1880, for many years state director of the Prudential Life Insurance Company of America, formerly surgeon to Woman's Hospital and medical director of St Michael's Hospital, gynecologist, supervising obstetrician and trustee of St Barnabas Hospital, consulting gynecologist, Beth

Israel Hospital, Newark, All Soul's Hospital, Morristown, Mountainside Hospital, Montclair, and the Rahway Memorial Hospital, Rahway, president of the Society for the Relief of the Widows and Orphans of Medical Men of New Jersey, aged 88, died, June 9, at his summer home in Island Heights. The Academy of Medicine of Northern New Jersey, of which he was the first president, created a special award in honor of Dr Ill, making the first presentation to him on his eighty-fifth birthday May 23, 1939 and at the same time conferring on him honorary membership. In 1934 a bust was presented to the academy to mark Dr Ill's eightieth birthday. The presentation of his portrait to the Hospital of St Barnabas and for Women and Children in 1940 marked his completion of fifty-eight years of service on the staff, and the following year the Essex County Medical Society awarded him a scroll of appreciation in recognition of his completion of more than fifty years in the practice of medicine.

**Terry Monroe Townsend** ♂ New York, University of Louisville (Ky) Medical Department, 1897, past president of the Medical Society of the State of New York and the Medical Society of the County of New York, member of the House of Delegates of the American Medical Association in 1929 and from 1935 to 1938 and in 1941, member of the American Urological Association, fellow of the American College of Surgeons, diplomate of the American Board of Urology, Inc, veteran of the Spanish-American War, director of urology, Morrisania City and Department of Correction hospitals, attending urologist, Lutheran Hospital, consulting surgeon, Sing Sing Prison Hospital, Ossining, consulting urologist, Ossining (N Y) Hospital and the Midtown and Community hospitals, New York, aged 65, died, May 16, of pneumonia.

**Granville Scott Hanes** ♂ Louisville, Ky, Hospital College of Medicine, Louisville, 1900, professor of proctology at the Kentucky School of Medicine, 1905-1906, professor of diseases of the rectum at the University of Louisville School of Medicine from 1906 to 1923, clinical professor of proctology and later professor emeritus, member of the American Proctologic Society and the Southern Surgical Association, fellow of the American College of Surgeons, in 1929 president of the Kentucky State Medical Association, on the staffs of the Louisville City, Kentucky Baptist, Jewish, St Anthony's

and Kosair Crippled Children's hospitals, aged 75, died, May 21, of injuries received when he fell from a sixth floor window.

**Charles Sylvester Skaggs** ♂ Carbondale, Ill, Barnes Medical College, St Louis, 1903, member of the House of Delegates of the American Medical Association from 1928 to 1938, past president of the Illinois State Medical Society and the St Clair County Medical Society, in 1937 was appointed by the late Gov Henry Horner as one of fifteen members of a newly created state advisory committee for the division of handicapped children of the Illinois Department of Public Welfare, aged 63, died, May 6, of cerebral hemorrhage and arteriosclerosis.

**Harold Guegnon Fabien Edwards** ♂ Shreveport, La, Medical Department of Tulane University of Louisiana, New Orleans, 1911, member of the American Roentgen Ray Society, Radiological Society of North America, Inc, American Radiological Society and the American College of Radiology, fellow of the American College of Physicians, member of the American Board of Radiology, Inc, served during World War I, attending radiologist, T E Schumpert Memorial Sanatorium and the Tri-State Hospital, aged 53, died, May 2, of coronary occlusion.

WILLIAM P WHERRY, M D, 1880-1942

Clyde W Morter \* Milwaukee, Wisconsin College of Physicians and Surgeons, Milwaukee 1907, assistant clinical professor of proctology at the Marquette University School of Medicine, member of the American Proctologic Society, member of the American Board of Surgery, on the staffs of Columbia Hospital, Milwaukee County Hospital and Dispensary and Mount Sinai Hospital, consulting proctologist at the Veterans Administration Facility, aged 61, died, April 11, of influenzal encephalitis and pneumonitis

Joseph Aloysius Meledy, Washington, D C, Tufts College Medical School, Boston 1918, member of the Massachusetts Medical Society, served in the U S Navy during World War I and at the time of his death was a lieutenant commander in the U S Naval Reserve at various times served on the staffs of the Veterans Administration facilities in Boston and Washington, aged 50, died, April 1, in the Walter Reed General Hospital of an intracranial lesion of an undetermined type and hemiplegia

Roy L Pierce, Mount Gilead, Ohio, Ohio Medical University, Columbus, 1896, member of the Ohio State Medical Association, for many years county health officer, formerly county coroner and member of the board of education of Mount Gilead formerly medical examiner for the U S Civil Service Commission and medical examiner for the draft board in the first and second world wars, organized the Mount Gilead chapter of the American Red Cross in 1917 aged 73, died May 3

James A Milligan, Garnett Kan, Central College of Physicians and Surgeons, Indianapolis, 1883, member of the Kansas Medical Society, member of the State House of Representatives from 1907 to 1909 and state senator from 1909 to 1911 and again from 1917 to 1919, formerly mayor of Greensburg, past president of the Santa Fe Medical and Surgical Society, aged 86, died, April 19, in the Ransom Memorial Hospital Ottawa, of carcinoma of the gallbladder

Earl Cunningham MacCordy \* St Petersburg, Fla, Tufts College Medical School Boston, 1916 served during World War I, acting assistant surgeon, U S Public Health Service on the staffs of the Mound Park and St Vincent's hospitals, aged 51, died, April 5, of coronary thrombosis

Ronald Bacon Rogers \* Neenah, Wis, Columbia University College of Physicians and Surgeons New York 1917 served in the U S Navy during World War I, president of the staff of the Theda Clark Hospital, aged 50, died, April 4 in the Mercy Hospital Oshkosh, of cirrhosis of the liver

Bernard Milnis, North Bergen N J, University of California Medical School San Francisco, 1936, member of the Medical Society of New Jersey on the staffs of the Christ Hospital, Jersey City and the North Hudson Hospital, Weehawken, aged 32, died April 19 of myelogenous leukemia

Charles Harold Newell, Omaha, John A Creighton Medical College, Omaha, 1908, member of the Nebraska State Medical Association, instructor in surgery at his alma mater, served during World War I, on the staff of the Nicholas Senn Hospital aged 59, died April 2, of coronary thrombosis

George S Lambert, New Rochelle N Y Columbia University College of Physicians and Surgeons, New York, 1928, member of the Connecticut State Medical Society, at one time health officer of Killingly and Danielson, Conn., aged 41, died April 2, of carcinoma of the liver and rectum

Hartsford Lee Ison, Wedowee Ala, Southern Medical College, Atlanta, Ga, 1891, member of the Medical Association of the State of Alabama, served during World War I, aged 74, died April 3 in a hospital at Montgomery of arteriosclerotic and hypertensive heart disease

Francis Clement O'Malley, Plains Pa, Maryland Medical College Baltimore, 1912, served with the American Expeditionary Forces in France during World War I as a captain in the medical department aged 55 died April 11, of chronic myocarditis

Milton Perry McElhannon, Belton, Texas, Vanderbilt University School of Medicine, Nashville Tenn, 1900 member of the State Medical Association of Texas, fellow of the American College of Surgeons aged 62, died, April 20 in Houston of bronchopneumonia

David Jackson Jacobson \* Bemidji, Minn Drake University College of Medicine Des Moines, 1913, on the staff of the Lutheran Hospital aged 51, died April 17 in the Worrall Hospital Rochester of myocardial infarction and coronary sclerosis

Charles W Peek, Cedartown Ga (licensed in Georgia in 1889) member of the Medical Association of Georgia served

for a number of terms in the general assembly of Georgia and one term in the state senate, aged 76, died, March 1, of heart disease

Otis Andrew Moore, Columbia, Mo, College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1910, aged 53, died April 8 in the Noves Hospital of gastric hemorrhage

Edward Henry Wolinski, Chicago, Loyola University School of Medicine, Chicago, 1919, member of the Illinois State Medical Society, on the staff of the Walther Memorial Hospital, aged 48, died April 23

Charles Day Moulton, East Orange N J, University of Pennsylvania Department of Medicine Philadelphia, 1902, aged 66, died, April 11, of arteriosclerosis, cerebral embolus and chronic myocarditis

Peter E Maras \* Jersey City, N J, University of Louisville (Ky) Medical Department 1911, on the staff of the Greenville Hospital aged 57, died, April 6, of coronary thrombosis

Charles Colfax McFarlin, Westport, Ind, Kentucky School of Medicine Louisville, 1902, served during World War I aged 73 died, April 6, of gastroenteritis and arteriosclerosis

Julia R Youngman Johnson, Los Angeles, Woman's Medical College of Pennsylvania, Philadelphia, 1903, aged 67 died March 17, of cerebral hemorrhage and hypertension

Nelson A Harris, Hackensack, N J New York Homeopathic Medical College, New York, 1881, aged 81, died, April 9 of chronic myocarditis

Edwin Glenn Smith, Atlantic City N J, Jefferson Medical College of Philadelphia, 1888, aged 80, died, April 3 of cardiac decompensation and arteriosclerosis

Joseph W Neal, Scotland Ga Atlanta Medical College, 1889 member of the Medical Association of Georgia, aged 76 died March 3 of carcinoma of the prostate

Davis W Collins, Effingham, Kan, Kansas City (Mo) Medical College 1898, member of the Kansas Medical Society aged 67 died March 14, of heart disease

Giuseppe Mario Pellettieri, St Louis (licensed in Missouri in 1915) aged 60, died April 6, in the Bethesda General Hospital of cardiovascular disease

Charles E Nelthorpe, Sherwood, Mich, Detroit College of Medicine, 1888, aged 80, died April 4 of arteriosclerotic heart disease and diabetes mellitus

Arthur Donald Wilson \* Mission Texas, Queen's University Faculty of Medicine, Kingston Ont Canada, 1930 aged 38, died, April 17

D Westervelt Rawlings, Kansas City Mo Marion-Sims College of Medicine St. Louis 1897 aged 77 died April 9, of coronary sclerosis

Mathias Aguire Serna, Crystal City, Texas Chicago College of Medicine and Surgery, 1916, aged 63 died, March 9 of pneumonia

Arthur Hale Gilmore, Eaton Ohio, Rush Medical College Chicago 1893, aged 71 died, March 17 in Chicago of heart disease

Hugh C Gault, St Clair Mo St. Louis Medical College 1882 aged 83, died, March 7 in St. Louis of ruptured aortic aneurysm

Charles Hunter Robinson, Cullom Ill, Chicago College of Medicine and Surgery 1910 aged 66, died April 14, of uremia

Monta Waynefort Jamison Middleton, New York Fort Wayne (Ind) College of Medicine, 1888, died, April 5

Louis Willard Matthei, Chicago, Rush Medical College Chicago, 1897, died, April 5

#### DIED IN MILITARY SERVICE

Leslie Turner Bolton, Reno, Nev, University of Tennessee College of Medicine Memphis, 1917, served as a medical officer during World War I, at one time acting assistant surgeon in the U S Public Health Service formerly on the staffs of the Veterans Administration facilities in Los Angeles San Francisco and Reno was called to active duty as a lieutenant colonel in the medical reserve corps of the U S Army Nov 15 1941 aged 51 died May 2 of uremia at sea enroute to foreign duty

## Bureau of Investigation

### CEASE AND DESIST ORDERS

#### Abstracts of Certain Federal Trade Commission Releases

The work of the Federal Trade Commission, in helping to protect the public against misrepresentation or fraud in the medical as well as other fields, has been greatly extended by the provisions of the Wheeler-Lea Amendment to the Federal Trade Commission Act. The Food, Drug and Cosmetic Act of 1938 added to the Food and Drug Administration's control of the advertising claims and statements made on the labels of medicine or on the carton or in the accompanying leaflet, whereas what might be termed collateral advertising, that which appears in newspapers and magazines and over the air, comes more actively under the purview of the Federal Trade Commission by virtue of the Wheeler-Lea Amendment.

THE JOURNAL has at various times commented on the activities of the Federal Trade Commission in this connection, even before the Wheeler-Lea Amendment gave it its added rights. In some cases the Commission may accept from the person or concern involved a stipulation that the objectionable practices or claims cited will be discontinued. In other cases the Commission issues what is known as a Cease and Desist Order, in which the individual or company cited is ordered to cease and desist from practices which have been declared objectionable. Abstracts of some of the orders issued during 1941 follow.

**Caboteks**—This alleged remedy for female disorders is put out by a Charles Campbell Battenfield Sr., trading as Dean Cabot of Pittsburgh, whose advertising represented the product as a cure or remedy or a safe and effective treatment for delayed menstruation. The Federal Trade Commission declared that the product is not safe to use, since it contains the drugs ergotin, apiol green, oil of savin and quinine sulfate in quantities sufficient to cause irreparable injury to health if used under the customary conditions or those prescribed in the advertisements. In November 1941 the Commission ordered Battenfield to discontinue these misrepresentations and also any advertisements which fail to reveal that the use of "Caboteks" may cause gastrointestinal disturbances and other serious consequences.

**"Flexible Kone" and "Dependon" Products**—These are put out by a Mrs. Anne M. Jenks of White Bear, Minn., trading as Jenks Physicians' Supplies and Dependon Products. In November 1941 the Federal Trade Commission ordered Mrs. Jenks to discontinue the following misrepresentations in her advertisements: that any preparations or devices that she sells are safe, competent or effective preventives against conception or pregnancy and effective treatments for certain female diseases. She also was ordered to discontinue any advertisements which failed to reveal that her "Flexible Kone Diaphragms" and "Flexible Kone Pessaries" cannot be worn without danger of injury and infection, or that the warning that her "Dependon Intrauterine Paste" is a caustic substance which may destroy healthy tissues and produce necrosis.

**Mineral Wells Crystals**—These are put out by Mineral Wells Crystal Producers, Inc., Mineral Wells, Texas. In November 1941 the Federal Trade Commission ordered the Texas concern to discontinue certain misrepresentations in its advertising. Among these were that the product as sold to the trade is uniformly derived from mineral water obtained in its natural state from the earth in the vicinity of Mineral Wells or that, as implied by the use of the word "Certified," the product has been endorsed or attested as to quality or fitness by some governmental, scientific or other recognized agency empowered and qualified to certify to such facts, when such an endorsement has not been obtained.

**Mother Nature Soap Lake Salts, Seltzer and Spirit**—These are promoted by the Soap Lake Products Corporation, Seattle. In August 1941 this concern was ordered by the Federal Trade Commission to cease representing that its nostrums when used externally will cure or benefit eczema or similar conditions, or when taken internally will prevent or cure various rheumatic conditions, gangrene or Buerger's disease, or offer anything more than temporary relief for any of the disorders named. In April 1939 the Commission had issued a similar order against the same concern.

**Parkelp**—This was a dehydrated kelp product put out in two forms known as "Granular Parkelp" and "Parkelp Tablets." In at least five instances the Food and Drug Administration seized shipments of Parkelp and declared the product to be misbranded under the Pure Food and Drugs Act because the amounts of minerals it contained were misrepresented or because of fraudulent therapeutic claims on the labels. Government chemists reported Parkelp to consist essentially of plant material (chiefly kelp) containing chlorine, potassium, sodium, calcium, phosphorus, iron and some other minerals. In July 1941 the Federal Trade Commission ordered Philip R. Park, Inc., San Pedro, Calif., to discontinue advertisements which represent that Parkelp has any therapeutic value beyond that afforded by its iodine content that it contains iron,

copper, calcium, phosphorus, sodium, potassium, magnesium, sulfur or other minerals in quantities sufficient to have therapeutic value in treating or preventing diseases or conditions resulting from a deficiency in such minerals, or that it will build resistance to mineral deficiency diseases or furnish food minerals other than iodine in quantities sufficient to be of value in combating mineral deficiency diseases, or that Parkelp contains minerals which are not present in food or that the average diet is deficient in the minerals necessary for proper functioning and health of the body.

**Rex Perio Pills**—This was put out by a Louis Podrofski of Chicago, who operated under the name Rex Drug Company. Analysis showed the product to contain ergotin, extract of black hellebore, aloes and oil of savin in quantities sufficient to cause serious and irreparable injury to health if used as directed in the advertisements. In July 1941 the Federal Trade Commission issued a cease and desist order against Louis Podrofski and the Rex Drug Company individually, directing them to cease disseminating any advertisements which would represent that their nostrum is a safe and effective treatment for delayed, scanty and painful menstruation or any which would fail to reveal that the use of Rex Perio Pills may cause gastrointestinal disturbances and excessive congestion and hemorrhage of the pelvic organs and, in cases of pregnancy, may result in cases of uterine infection and blood poisoning.

**Sterline's Combination Home Treatment**—This group of products put out for the treatment of asthma by W. K. Sterline, Sidney, Ohio, includes three nostrums, sometimes known as "Sterline's Asthma Compound," "Sterline's Bronchial Elixir" and "W. K. Sterline's Korma Powder." According to the Federal Trade Commission, one of the ingredients is sodium bromide, the use of which over a long period may cause rash and mental derangement. The Commission further found that the Sterline products have no generally recognized value in the treatment of asthma or bronchitis, and, in September 1941, ordered W. K. Sterline and Mumm, Romer, Robbins & Pearson, Inc., Columbus, Ohio, the agency that handles Sterline's advertising, to cease representing that these mixtures, when used separately or in any combination, are a cure or remedy for asthma or bronchitis, and to discontinue any advertisements for "W. K. Sterline's Compound" which fail to reveal that this preparation should not be used by persons suffering from active or latent tuberculosis, lest it cause mental derangement. The defendants were permitted to omit this warning, however, if their advertisements included the statement, "Caution: use only as directed on the label." It is interesting to note that in July 1937 W. K. Sterline had signed a stipulation in which he had promised the Federal Trade Commission that in the sale of his asthma treatment he would no longer represent that it would remove the cause of asthma or hay fever or offer any more than temporary relief of the symptom, nor would he state either directly or by inference that the use of it was safe, unless he explained that it was not intended for persons having tuberculosis.

**Thorson's Soap Lake Products**—Under this brand name one Roxie Thorson trading as Thorson's Soap Lake Products Company, Soap Lake, Wash., puts out "Salts," "Effervescent Soap Lake Salts," "Liniment," "Skin Aid Soap Lake Ointment," "Shampoo" and "Skin Aid Soap Lake Soap." In August 1941 the Federal Trade Commission ordered Roxie Thorson to cease representing that these preparations are a cure remedy or competent treatment for a long list of disorders, among which are diabetes, blood diseases, psoriasis, pyorrhea, Buerger's disease, gangrene, women's ailments, rheumatism, dropsy, high blood pressure, arthritis and a good many others. In January 1939 the Commission had issued a similar order against the names Roxie Thorson and Thorson's Soap Lake Products Company. Still earlier, in July 1930 and October 1931, shipments of Thorson's Soap Lake Salts had been declared in district federal courts to be misbranded under the Pure Food and Drugs Act because of fraudulent claims made for the product in or on the trade packages. In connection with one of these cases the government chemists had reported that the product essentially contained 50 per cent of sodium carbonate, 25 per cent of sodium sulfate (Glauber's salt) and 10 per cent of sodium chloride, with smaller amounts of other salts and 13 per cent of moisture.

**Triple X Relief Compound and Perio Pills**—The latter also was known as "Reliable Perio Compound" and "Perio Relief Compound," and both preparations were sold by one Earl Aronberg of Chicago, doing business as Positive Products Company and Rex Products Company. In September 1941 the Federal Trade Commission ordered Aronberg to discontinue any advertisements which represented that his preparations are effective remedies or treatments for delayed menstruation or are safe to use, or which failed to reveal that the use of these mixtures might cause gastrointestinal disturbances and severe toxic and circulatory conditions, and, in the case of pregnancy, might produce violent poisonous effects on the system.

**Wroblewski Nostrums**—These are distributed by one D. Stefan Wroblewski, operating under various trade names, and by three corporations, D. W. Wroblewski, Inc., D. Wroblewski and Company, Inc., and Daferu Drug Company, Inc., all of Brooklyn. In July 1941 the Federal Trade Commission ordered these respondents to discontinue their representations in the advertising of a long list of nostrum products under Polish names. The order particularly directed the respondents to discontinue all advertisements which represent it as harmless or which fail to contain a warning against its frequent and continued use and excessive dosage, and to caution the user that it should be taken only as directed on the label when the label contains proper cautionary directions. The order also prohibited use of the words "laboratory" and "scientific" or "Dr." when the latter refers to D. Stefan Wroblewski. The findings, is not a physician. Also banned were testimonials which purport to have come from the respondents' customers but which were prepared by the promoters themselves.

## Correspondence

### SURGERY IN CANCER OF THE PROSTATE

*To the Editor*—An opinion expressed in THE JOURNAL, March 7, page 855, in answer to a query from a doctor in California is entirely false and is not held, I am sure, by a majority of urologists.

Carcinoma of the prostate differs from carcinoma elsewhere in the body in no particular respect so far as treatment is concerned except for the newer procedures of diethylstilbestrol and castration. An early diagnosis of carcinoma of the prostate can and has been repeatedly made, and when made by the urologist trained to do radical prostatectomy, it can and has been repeatedly cured. The problem is one of early diagnosis, and this has been made and confirmed when the lesion is not larger than 1 cm in diameter.

In these cases, confirmation has usually been made by frozen section after perineal exposure, and if after such biopsy the presumptive clinical diagnosis has been proved false the perineum can be closed and no harm done. This procedure is now a recognized routine in all well trained urologic centers.

Confirmation of the suspicion of cancer of the prostate is so easily made by rectal palpation that an early diagnosis has even a better chance of being made than in cancer of internal organs that are beyond the reach of palpation. For years well trained urologists have told of the wisdom of routine rectal examinations for this reason more than any other. I can cite the cure of more than 20 patients with early carcinoma of the prostate from my own practice.

The difference of opinion arises from the failure of urologists such as the one who answered the query in THE JOURNAL to recognize the difference between early and late cancer. His remarks apply only to the latter.

FRANK HINMAN, M D, San Francisco

*To the Editor*—It appears to me that the statement in the March 7 issue of THE JOURNAL (in the department of Queries and Minor Notes) regarding carcinoma of the prostate to the effect that "It is the opinion among urologists that once the clinical diagnosis of carcinoma of the prostate has been made it is technically impossible to do any sort of surgical procedure that would effect a cure" is an unfortunate one. It seems to me an error to dismiss in such a cavalier fashion the not infrequent series of promising results of total prostatectomy in cases in which early diagnosis is not missed because of lack of awareness or suspicion of the nature of isolated hard areas in the prostate. As I see it, the chief problem about cancer of the prostate is that of making the physician who is not a urologist suspicious of what he feels on a carefully done rectal examination.

J GORDON SCANNELL, M D, Charles River, Mass

*To the Editor*—In THE JOURNAL, March 7, page 855, is a statement with regard to cancer of the prostate. This statement is untrue, and I seriously object to having it go unchallenged, because there is no question of the fact that many patients with early carcinoma in our clinic have been cured by total radical perineal prostatectomy and seminal vesiculectomy, and I know that this is true in several other clinics. I hope that you will do what you can to correct this misstatement.

The thing to be encouraged is that every male patient over 50 should have a rectal examination done, if there is a suspicious nodule present the patient should be sent to a competent urologist, who will proceed to take a biopsy, and if proved to be positive the biopsy should be followed by a total perineal

prostatectomy and seminal vesiculectomy after the method proposed by Young many years ago or by this operation as modified by ourselves.

O S LOWSLEY, M D, New York

Director, Department of Urology, James  
Buehnan Brady Foundation

*To the Editor*—The answer that "once the diagnosis of carcinoma of the prostate has been made, the condition is no longer surgical" is grossly in error. Statistics prove conclusively that carcinoma of the prostate has been cured in a considerable percentage of the cases by a radical operation in which the entire prostate with a portion of the vesical neck, the seminal vesicles and ampullae of the vasa deferentia have been removed with their fascial coverings in one piece. We have been assiduous in following all patients on whom our operation has been carried out. Some are still well from ten to twenty-six years after leaving the hospital. A meticulous analysis indicates that more than 40 per cent of the patients followed five years or longer after leaving the hospital have shown no evidence of recurrence or metastasis. That in rare instances metastases may become apparent after a longer period than five years cannot be denied, in fact, in a series of 100 patients there were 2 patients thought to be well who showed evidence of metastasis, one nine years and the other fifteen years after the radical operation.

In some cases in which the presence of carcinoma has been recognized by a very hard nodule in the posterior lobe of the prostate cures have been obtained by the removal of only one half of the prostate and the seminal vesicle above it. In other cases in which a considerable portion of the prostate was involved but the carcinoma had not passed beyond the capsule and surrounding fascias the radical operation has resulted in a complete cure, in many cases followed from five to twenty years.

Sir William Osler used to urge that a rectal examination be included in every physical examination. If such was the rule and practitioners realized that carcinoma always should be suspected when a definitely indurated area is found in the prostate, many patients could be subjected to a perineal operation in which the diagnosis could be confirmed and a radical cure obtained if carcinoma were found present.

Other clinics have confirmed my assertion that in well chosen cases carcinoma of the prostate may be cured by radical operation and definitely refute the assertion that "once the diagnosis of carcinoma has been made the condition no longer is surgical." In fact, with the radical operation performed fairly early the prognosis is excellent.

HUGH H YOUNG, M D, Baltimore

NOTE—These letters were referred to the urologist who wrote the reply. He comments:

*To the Editor*—The question was: What is the surgical treatment of malignant neoplasms of the prostate? This question implies, to me at least, that the diagnosis is obvious and that it is clinically made. The answer was that once a clinical diagnosis of carcinoma of the prostate has been made it is technically impossible to do any sort of surgical procedure that would effect a cure. Any one familiar with urologic conditions knows of the well recognized methods of perineal exposure and prostatic biopsy in suspicious cases, but not in clinically obvious carcinoma of the prostate. With conditions not readily diagnosable by palpation or any other well recognized clinical method a patient should, if properly managed, be subjected to perineal exposure of the prostate, prostatic biopsy and frozen section study. The procedure from there on is determined by the results of the microscopic study of that section. If the result is positive for carcinoma, the diagnosis is not a clinical one but microscopic and it is from this group that successes may be expected following radical perineal prostatectomy. All comments received dwelt on that particular phase of the subject which, as far as I am concerned had nothing to do with the question submitted.

## FATAL PULMONARY EMBOLISM FOLLOWING VARICOSE VEIN INJECTION

To the Editor—Drs Vaughn and Lees have contributed much to medical science by publishing and evaluating a case of "Fatal Pulmonary Embolism Following Varicose Vein Injection" (*THE JOURNAL*, April 11, p 1293). They deserve the highest appreciation for their honesty and courage.

The mechanism of occlusion of the vein after the injection of different obliterating solutions has been studied microscopically by many authors (McPheeters, H O. *Injection Treatment of Varicose Veins*, Philadelphia, F A Davis Company, 1938, chapter 29, pp 133-145). It requires several days' time from the onset of the injury of the endothelial lining of the varicose vein to the point at which the whole lumen of the vein is tightly filled with a well attached thrombus. As a rule, after the injection of the sclerosing solution not the entire endothelial lining of the vein is injured uniformly. Islands of destroyed endothelium have been found with stratified thrombi, attached to the wall of the injured vein, next to spaces of intact intima with loosely adherent blood clots. The organization of the whole thrombotic masses usually begins at the end of the first week after treatment, with the growth of fibroblasts and capillaries into them. Furthermore the extent of the effectiveness of an obliterating injection cannot be fully determined for a week after treatment, as one may encounter cases of progressive obliteration. Keeping this fact in mind, together with the pathologic condition of the obliterated vein, an additional possible reason for the case of fatal embolism is evident.

Three injections of sodium morrhuate had been given into the same vein on three consecutive days and a fourth injection was given on the fifth day. It is unlikely that there had been complete obliteration of the vein on the second, third or fifth day after the treatment was started. Had obliteration been complete after the first injection, the same vein should not have been injected again. However, partial obliteration might well have occurred following one of these injections, and the insertion of the needle and subsequent injection of sclerosing fluid into the incomplete thrombus may well have loosened a small blood clot which floated toward the heart or lung and caused the lethal embolism. This consideration strongly suggests the advisability of allowing a lapse of time between injections, and the majority of authors do not recommend treatments at less than weekly intervals.

Another possible cause of embolism is the injection of too small an amount of sclerosing solution with too little resultant injury to the intima. Sodium morrhuate 5 per cent cannot be considered as a powerful solution, and 15 cc is a small amount, as noted in an experimental study published from the Skin and Cancer Unit, New York Post-Graduate Medical School and Hospital (*Arch Dermat & Syph* 42:86 [July] 1940). According to Paul Linser, one of the originators of injection therapy for varicose veins, the proper solution for such treatment must possess "the necessary energy to injure the vein wall" (*Munchen med Wchnschr* 79:1598 [Sept 30] 1932). One should try to provoke a pronounced reaction with the first injection. Extensive injury to the intima guarantees a proper anchorage of the thrombus on the wall of the vein and minimizes the formation of blood clots within the area of thrombus formation, thus reducing the possibility of embolism. During the first years of injection treatment of varicose veins fatal accidents were attributed to the lack of effectiveness of the injected solutions or to faulty technique (*Munchen med Wchnschr* 79:1969 [Dec 2] 1932).

When one reviews the 61 cases of embolism compiled by Drs Vaughn and Lees, sodium morrhuate with 15 listed cases ranks first, while quinine-urethane follows. In the majority of cases the injections had been given at short intervals.

In addition to the conclusions of Drs Vaughn and Lees, the following rules governing the treatment of varicose veins should be observed:

- 1 Injections should not be given at less than weekly intervals.
- 2 A sufficiently large amount of a solution strong enough to produce extensive damage to the intima should be employed.
- 3 Because of publications about allergic reactions following the injection treatment of varicose veins with sodium morrhuate, including several of our own cases of severe shock (*New York State J Med* 37:1506 [Sept 1] 1937) we replaced sodium morrhuate successfully four years ago by the use of a sugar solution of high concentration and high viscosity (*M Rec* 147:307, 1938) and therefore recommended its adoption. With its use the results of treatment have been excellent and no untoward reactions have been noted. Furthermore, the results obtained reduced the total number of injections necessary in each case. The cramping pain occurring during the action of the injected sugar solution did not discourage our patients because they felt recompensed on contrasting the results obtained from other solutions previously used.

EUGENE F. TRAUB, M.D.

LUDWIG ISAAK, M.D.

## TUBERCULOSIS AMONG MEDICAL STUDENTS

To the Editor—In the May 16 issue of *THE JOURNAL*, page 266 there is in an editorial comment on "Tuberculosis Among Medical Students" one statement of which should be corrected. "It must be recognized likewise that periodic x-ray examination is the only sure method of recognition of the disease."

It would have been much better to state that x-ray examination is of value in the detection of pulmonary tuberculosis, for there is, of course, no method that can be called a sure method for diagnosing tuberculosis or any other disease. I have seen many patients who had pulmonary tuberculosis and tuberculosis of the hilar lymphatic nodes with ulceration into a bronchus and roentgenoscopic examination did not reveal evidence of a pulmonary lesion, on the other hand, there are many infiltrations in the lung that have been diagnosed tuberculosis from roentgenoscopic study when the lesion was nontuberculous.

I think it is unfortunate that the medical profession at large and roentgenologists in particular have developed an idea that roentgenoscopy is the final word in diagnosis. I am sure that the entire profession recognizes the great value of roentgenoscopic study, but to attribute unfailing accuracy to any method of examination is an unfortunate mistake.

PORTER P. VINSON, M.D., Richmond, Va

## "CLINICAL ROENTGENOLOGY OF PREGNANCY"

To the Editor—Please be advised that the reviewer's statement regarding my book that a good number of the one hundred and nineteen illustrations had been "touched up" is not sufficiently clear. None of the photographs or reproductions were retouched.

The differentiation of the soft tissues of pregnancy is elicited by relative overexposure of the film and the use of a very bright spotlight later. This is becoming a common and useful practice in many branches of roentgenology.

The reviewer evidently considered the superimposed guidelines on the pelvimetry photographic reproduction as "touched up." To these he took objection. However, it is my considered opinion that these guidelines are absolutely essential for the reader if the book is to be used as a work of reference for practicing measurements on these illustrations.

WILLIAM SNOW, M.D., New York

### North Dakota January Report

The North Dakota State Board of Medical Examiners reports  
the written examination for medical licensure held Jan 6-9,  
1942 The examination covered 13 subjects and included 100  
questions Four candidates were examined, 3 of whom passed  
and 1 failed Two physicians were licensed to practice medicine  
by reciprocity and 3 physicians so licensed by endorsement  
The following schools were represented

| School  | PASSED                  | Year   | Number      |

## Bureau of Legal Medicine and Legislation

### MEDICOLEGAL ABSTRACTS

**Malpractice Liability of Physician for Alleged Negli-  
gence in Treatment of Burns**—In January 1934 the plain-  
tiff was severely burned on her face, neck, arms and legs by  
an explosion in one of the chemical rooms of the Standard Oil  
Company She was immediately taken to the company's first  
aid station and later the same day was removed to a hospital  
in Casper where she was treated by the defendant, a physician  
employed by the Standard Oil Company Among other treat-  
ment given, the burned areas were sprayed with tannic acid and  
later with mercurochrome and petrolatum On June 26, 1934  
the plaintiff was taken to Chicago and placed in the care of  
the defendant's brother medical director of the Standard Oil  
Company She remained in Chicago until about the first of  
September, during which time about two hundred skin grafting  
operations were performed The plaintiff then returned to  
Casper where she remained under the defendant's care until he  
was discharged in June 1936 When she returned from Chicago  
her feet and legs were crooked and a drop in her left foot had  
developed which prevented her from placing her left heel on the  
ground The right leg was finally straightened, but little could  
be done for the left because of the extreme tenderness of the  
burned areas The plaintiff subsequently sued the defendant for  
malpractice At the time of the trial the motion of the plain-  
tiff's left foot and left arm was very limited, and she was unable  
to walk without the aid of crutches At the close of all the  
evidence, the defendant made a motion for a directed verdict in  
his favor The motion was sustained and judgment entered  
thereon The plaintiff then appealed to the Supreme Court of  
Wyoming

On appeal the plaintiff contended that the trial court, in pass-  
ing on the motion for a directed verdict should have considered  
only the plaintiff's evidence and such of the defendant's evidence  
as was favorable to the plaintiff, together with all fair inferences  
therefrom The defendant argued that the trial court had the  
right and duty to consider all the evidence introduced The  
Supreme Court indicated that the plaintiff's contention was  
probably correct in most ordinary actions but held that a dif-  
ferent rule applies in malpractice cases In many instances the  
court pointed out a physician is required to choose one of two  
or more equally acceptable methods of treating a particular  
condition Where there is a fundamental difference of opinion  
among physicians the court said it would be unfair to permit  
a jury with no special training at all to decide a matter on  
which the profession itself had been unable to agree In *Harris  
v Schoonmaker* a malpractice case 50 Wyo 119 58 P (2d)  
415 60 P (2d) 360, the Supreme Court of Wyoming said that

"it is assuredly the duty of the court to survey the entire evidence in the case, where, as here, a motion to direct a verdict was made after the evidence of the parties had all been introduced. If this is not done, an unjust and inaccurate result might easily be reached." The court therefore concluded in the present case that if the act or omission of a competent physician or surgeon, on which a claim of negligence in a malpractice case is predicated, clearly involves and constitutes the exercise of an honest judgment, arrived at after careful and necessary investigation and approved by a respectable portion of competent and reputable men of the same school of medicine, and there is nothing, in the judgment of the trial judge, to indicate that the approval is not honestly made or that it or the act or omission is unreasonable, or that special circumstances or facts would make it fairer to submit the case to the jury, then it is not error to direct a verdict for the defendant.

The plaintiff's major contention concerning the defendant's conduct was that there had been an unnecessary delay in performing the skin grafting, that it should have been done in March or April rather than in July. The undisputed testimony of all the physicians who appeared as witnesses was that skin grafting should be done as soon as the condition of the wound and of the patient permits. The hospital chart showed that, during nearly all the time until the plaintiff was taken to Chicago, her pulse rate ranged between 90 and 100 and her temperature varied between 100 and 103 F. The plaintiff's condition was also indicated by the fact that on her trip to Chicago she had to be accompanied by her mother, a nurse and a physician, and she had to be lifted out of the Pullman car through a window. The plaintiff's evidence, as well as that of the physicians who testified on behalf of the defendant, was to the effect that the time to perform a skin grafting operation is largely a matter for the professional judgment of the attending physician. The Supreme Court therefore concluded that, in view of the obvious physical condition of the plaintiff during the time in question, the plaintiff had not made any showing that the defendant had negligently delayed the skin grafting operation.

The plaintiff also complained of the way her left arm was treated and contended that another method would not have left it with limited motion. The evidence showed that the arm was bandaged every day and then placed on a pillow on the plaintiff's chest and the defendant said that he exercised the arm as much as possible to keep it from getting stiff. The plaintiff's expert testified that it was not good practice to let the arm rest on the chest—that it should have been kept straight along the body, in splint or on a board. Both the plaintiff's witness and the defendant admitted that the scar tissue would be stiff. The difference seemed to be that, if the arm was to be stiff, the plaintiff's witness wanted it extended and the defendant wanted it bent. Since the stiffness of the arm was in the shoulder, not the elbow, however, the court held that the foregoing testimony was in no way material. Again the Supreme Court held that the way the arm was placed was a matter of professional judgment and that no negligence was shown.

Likewise the plaintiff contended that a different treatment would have prevented the foot drop. It was admitted that muscles destroyed by burns cannot be restored, but the plaintiff's expert indicated that the cause of the foot drop was the treatment received by the plaintiff before going to Chicago and stated that only a foot not properly supported will drop. The evidence showed, however, that while in the hospital the plaintiff's left heel had been supported by a "doughnut" and that by the use of pillows held in place by sand bags the foot had been kept in an upright position at all times. Since the drop did not occur before the plaintiff went to Chicago, the Supreme Court concluded that the defendant had not been negligent. Furthermore, there was no medical testimony of any want of care after the plaintiff's return home. The plaintiff argued, however, that since the defendant's brother had been selected by the defendant to perform the operation he was, in effect, the defendant's agent, and the defendant was liable for his negligence. The court held that a physician who merely arranges for an operation by another not his associate, employer or employee and lends casual assistance at the operation is not jointly liable for the negligence of the operating physician.

The Supreme Court further held that the plaintiff's argument to the effect that the defendant had admitted his own incompetence by advising the plaintiff to go to Chicago for treatment could not be sustained, saying

If it were valid, we fear that every physician who recommends that his patient should go to Mayo's, to Chicago, to Denver, or any other place, would thereby show that he is incompetent, and knowledge of that fact would thereby be conveyed to every one who participated in sending the patient away. A great number of the physicians in this state would, we fear, if the argument were true, stand convicted of incompetence, since scores are sent away from time to time to have the care of some other physician in larger cities.

After reviewing the evidence in detail, the Supreme Court concluded that the trial judge was justified in directing a verdict for the defendant. The judgment for the defendant was accordingly affirmed—*Smith v Beard*, 110 P (2d) 260 (Wyo., 1941).

**Pharmacy Practice Acts Right of State Board of Pharmacy to Establish Educational Requirements**—The pharmacy practice act of Nevada, passed in 1913, provides that "Licentiatees in pharmacy must be such persons as possess the fundamentals of a high school education and who have had at least five (5) consecutive years' actual experience in drug stores where the prescriptions of medical practitioners have been compounded, and who have passed a satisfactory examination before the state board of pharmacy." In January 1939 a bill was introduced in the Nevada assembly proposing, among other things, that every applicant for examination and registration as a pharmacist must be a graduate of a college of pharmacy recognized and approved by the Nevada state board of pharmacy after having received at least four years of pharmaceutical training and must pass an examination given by the Nevada state board of pharmacy. The bill was not enacted, but on May 25, 1939 the state board of pharmacy undertook to impose, by resolution, the educational requirements for licensure proposed by the bill. Thereafter, the petitioner applied to the board for permission to take an examination to become a licentiate in pharmacy. The application was denied because it did not show that the petitioner had received four years of training in a college of pharmacy. The petitioner then filed an original mandamus proceeding in the Supreme Court of Nevada against the board, asking that the court direct the board to accept his application for an examination.

If the legislature, said the court, instead of fixing the standards of education and experience for licentiatees, had employed language purporting to confer full and complete authority on the board of pharmacy to establish such standards, it would then be necessary for the court to decide whether the legislature could lawfully delegate such power to the board. The fact, however, that the legislature itself saw fit to establish such standards evidenced a legislative intent to reserve that power to itself and not to confer on the board the authority either to diminish or to add to the standards. The court admitted the importance of requiring that pharmacists possess such qualifications as the public safety demands but said that if higher qualifications than those prescribed are desirable the legislature has full power to impose them. The board was therefore ordered to examine the petitioner—*Estes v State Board of Pharmacy*, 111 P (2d) 48 (Nev., 1941).

## Society Proceedings

### COMING MEETINGS

- American Association for the Study of Neoplastic Diseases, Baltimore, June 25-27. Dr. Eugene R. Whitmore, 2139 Wyoming Ave. N.W., Washington, D. C., Secretary.

- West Virginia Medical Association, Charleston, June 11-13. Mr. Charles Lively, 1031 Quarrier St., Charleston, Executive Secretary.

## Current Medical Literature

### AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1932 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk ( \*) are abstracted below.

**Immunization Against Rheumatic Fever**—After eight years of immunizing 101 ambulatory patients suffering from rheumatic heart disease with graduated injections of hemolytic streptococcus filtrate Wasson and Brown state that the patients have shown a striking reduction in the number of recurrences and decided improvement in health. Many patients have been observed for as long as six years since injections were discontinued and their health is materially better than that of untreated patients. Bacteriologic study shows that infections of the upper part of the respiratory tract would develop but would be of short duration and would seldom be followed by a flare-up of rheumatic fever. As the protracted prophylactic treatment has drawbacks an abbreviated method of immunization was tried on 42 children in 1941, the total skin test doses was given in four, instead of thirty eight, inoculations intradermally three weeks apart. The number of reported colds per child was greatly reduced, the mean gain in weight per child was  $7\frac{1}{2}$  pounds (3.4 Kg) in nine months there were few subacute rheumatic symptoms and a fresh attack of rheumatic fever developed in only 2 patients in 1 who has both congenital and rheumatic heart disease and is chronically decompensated and in another who at the outset had a moderate chorea and showed no improvement. Only prolonged observation will demonstrate whether the results of this form of treatment are as lasting as those of protracted treatment.

**Induced Anoxemia Test**—Burnett and his co-workers subjected 125 normal persons free from cardiovascular disturbances to anoxemia induced by inhalation of a 10 per cent mixture of oxygen. Electrocardiography before and after anoxemia led them to believe that there is a usual, or 'normal' response consisting of practically no symptoms, but of certain rather definite changes in the electrocardiographic pattern which are promptly reversed by the inhalation of 100 per cent oxygen. There was no significant difference in the electrocardiographic response in the different decades of life. However, they have encountered 'abnormal' responses (suggesting coronary artery insufficiency) in 19.2 per cent of normal subjects and 'normal' responses in abnormal subjects too frequently to justify the continued use of the test in its present form for clinical diag-

nosis. The belief that some degree of coronary artery change is associated with the aging process is not supported by the studies. This means that the induced anoxemia test is not a dependable means for demonstrating coronary artery disease or that the disease does not consistently occur in the later decades. The authors favor the former opinion. For the present the test should be used only as a hospital procedure.

**Prognosis of Regional Enteritis**—The finding of 24 cases of regional enteritis in the hospital records prior to 1933 and of 154 up to 1941 (114 during the last four years) represented such a disproportionate increase as to indicate, in the opinion of Brown and Donald, an increasing incidence of the disease and not merely more acute recognition. Twenty-six per cent of the patients were Jewish and 70 per cent of them were less than 30 years old, whereas only 38 per cent of the gentle patients were less than 30. Roentgen examination after a barium sulfate enema revealed evidence of the disease in 124, and the barium sulfate meal identified 7 additional instances. Of the 178 patients 129 have been operated on one or more times. At the time of the report 87 of the patients were well, 29 were in fair condition, 26 were sick, 17 had died (exclusive of the 16 postoperative deaths) and there were no data on 3. It is not possible to predict the eventual status of the 29 patients listed as "fair." They are not invalids but they cannot be considered "well." The immediate mortality rate was lower and the ultimate result seemed better when the two stage operation was performed. The fate of those who require repeated intestinal resection is not encouraging. Only 14 of 23 patients so treated survived, and only 4 of them are considered "well." Twenty of 45 patients with complicating fistulas on whom there are data are apparently well, 19 after resection and 1 after a short-circuiting procedure. There were 9 deaths among the group of 45. Of the 31 who had short-circuiting operations 22 survived, and of these 14 were well at the time of the study, but only 7 have lived for three or more years after operation. When there is a preoperative diagnosis of a probable acute appendicitis in a patient found to have acute regional enteritis, such a patient should be kept under observation so that operation will not be delayed if complete resolution does not occur. Of 10 such patients 7 are well. Surgical intervention is the treatment of choice for regional enteritis. There is no known medical treatment that is of value in the sense that it cures the disease. The most important postoperative feature is maintenance of a high protein diet supplemented with components of the vitamin B complex.

**Ulcerative Colitis**—Andresen states that of 50 consecutive patients with severe ulcerative colitis only 2 died because of complications—in 1 mastoiditis with erysipelas and in 1 acute pyelonephritis. None of the patients required operation for the colitis. In 33 food allergy was the cause of the disease, and these were all treated successfully. The theory of allergy conforms well with the accepted criteria for the disease. The pathologic changes in early ulcerative colitis are identical with those demonstrated in allergy experiments on human beings and on animals. The symptoms of ulcerative colitis are easily explainable on an allergic basis. Proctoscopic and roentgen

study will demonstrate the effect of allergenic food and the improvement that follows when such food is withdrawn from the diet. Treatment based on an allergic theory has produced better results than that based on an infective etiology.

**Encephalitis in Yakima Valley**—From the inductive epidemiologic analysis of 86 cases of encephalitis in human beings and of 20 cases of encephalomyelitis in horses in 1939 and 1940, it appears to Hammon and Howitt that the western equine virus and the St. Louis virus were present in the Yakima Valley simultaneously and produced some instances of mixed infections. Neutralization tests of the blood serum of 50 patients showed 84 per cent to be positive for the western equine virus, 72 per cent for the St. Louis virus and 56 per cent for both viruses. The serum from 75 closely comparable controls from the general population disclosed neutralizing antibodies for the western equine virus in 67 per cent, for the St. Louis virus in 28 per cent and for both in 27 per cent. The figures for patients and controls were compared with those obtained for serum from other areas in the West and the difference helped to establish the presence of the St. Louis virus in the serum of Yakima patients as etiologically significant. The serum of a few normal chickens, pheasants and a duck were found to neutralize the western equine virus, and the blood of some horses neutralized the St. Louis virus. Suggestive correlation was found between the occurrence of antibodies in patients only to the St. Louis virus and contact with, or proximity to, horses, an observation which may be significant, since antibody to this virus was found in horses.

**Immunization Against Influenza**—Siegel and his associates report data of their studies on the epidemiology of influenza A and the prophylactic value of the subcutaneous inoculation of influenza virus vaccines begun at Letchworth Village in 1937 and concluded in 1941. The last time at which vaccine was inoculated was on Dec. 6 and 7, 1940, six weeks before an epidemic of influenza A occurred which lasted from Jan. 14 to Feb. 26, 1941. A threefold increase in complement fixing antibodies followed inoculation in 45 per cent of the vaccinated population. A significant decline was observed within two months after inoculation. A secondary rise occurred shortly afterward in response to infection during the 1941 epidemic. At this time the control population also showed a significant rise in titer, the first since the last epidemic in 1939. An increase in antibody titer following epidemics of influenza A was observed at Letchworth Village in three successive outbreaks in 1937, 1939 and 1941. During these periods there was serologic evidence of widespread exposure to influenza A virus. In intervening periods the titer of the population usually declined within a few months after infection. Cases with a significant rise in complement fixing titer ("positive cases") could not be differentiated clinically from those without a significant rise in titer ("negative cases"). Within the period between the onset of the first and last positive case in each cottage there was no significant difference in the incidence of acute respira-

tory illnesses among those inoculated with influenza virus vaccine and others. Annual inoculation of influenza virus vaccine since 1937 did not seem to modify the results. There was no difference in the incidence of respiratory illness between those who responded to the influenza virus vaccine with a significant rise in titer and those who had no rise in titer following inoculation. Influenza A recurred in 3 patients, in 2 in 1939 and 1941, and in 1 in 1937, 1939 and 1941.

**Aphthae and Herpetic Gingivostomatitis**—Results of various studies, Cahn and Bartels point out, demonstrate that aphthous ulcer, herpes labialis, aphthous stomatitis, herpetic stomatitis or acute infectious gingivostomatitis are caused by the herpes virus. The virus from aphthous lesions, when inoculated on the scarified cornea of rabbits, produced lesions identical to those caused by the herpes simplex virus. Encephalitis was induced in some animals subsequent to their inoculation with the virus from either herpes or aphthous lesions. Inclusion bodies were demonstrated in the cells of the injected cornea and the brains of animals inoculated with the virus of herpes or the virus of aphthous stomatitis. Rabbits inoculated with the virus of aphthous stomatitis were immune to the herpes virus. The herpetic antibody develops in the patient's serum during convalescence from herpes or aphthous stomatitis. The infection usually takes place in early childhood and is present thereafter. The virus remains dormant until some contributory factor lowers the local immunity of the tissue, when herpetic lesions occur. In contradistinction to other virus diseases, immunity is not permanent after an initial herpes simplex infection.

**Post-Traumatic Painful Osteoporosis**—To avoid confusion with atrophy of bone due to inactivity or disuse, Herrmann and his co-workers suggest that true osteoporosis is that type of atrophy of bone characterized by patchy demineralization.

tion with coexisting signs of vasomotor instability, trophic changes in the soft tissues and usually severe visceral pain. The expression "acute bone atrophy" only adds to confusion, since the word "atrophy" suggests a painful syndrome in which the affected bones are 'full of pores'. Consequently post-traumatic painful osteoporosis is the more logical term for the syndrome which frequently follows trauma to some multi-articular joint. Post-traumatic osteoporosis is characterized by partial loss of motor function of the affected part mild to severe vasomotor and trophic changes of the affected extremity, spotty demineralization of the bones near the site of trauma and mild to severe aching pain in the extremity. The functional disturbances are more extensive than can be explained on the basis of trauma alone and the aching pain is out of all proportion to the local signs of injury to the tissues. Roentgenologically there are two main forms of osteoporosis: the acute and the chronic form. The acute form is characterized by a mottled appearance of the bones due to the irregular rarefied areas in the spongiosa. The mottling is usually most definite in the carpal, tarsal metacarpal and metatarsal bones. In the chronic form the trabeculae of the bones are extremely fine and sometimes difficult to recognize. After the disease has reached the stage of almost complete decalcification, recalcification may begin spontaneously, but years later the roentgenograms may still show thinning of the cortex of the bones and thin lamellae containing irregular areas of recalcification. In cases without adequate treatment, recovery of function requires many months and frequently during recalcification extensive fusion of the carpal or tarsal bones takes place and this ankylosis usually causes great economic loss. The course of post-traumatic painful osteoporosis can be greatly shortened and most of the serious complications avoided if the disease is recognized in the acute phase and treated by thorough denudation of the main artery to the affected extremity (periarterial sympathectomy). Following periarterial sympathectomy 34 patients were relieved of aching pains and edema within twenty-four hours postoperatively, function began to improve within a few days and the patients resumed their work within an average time of three months. Complete return of function in a control group treated by physical therapy, roentgen therapy and other conservative measures took more than nine months. The course of the disease in the control patients was only slightly shortened, and unfavorable sequelae were about as frequent as when the process was left untreated.

**Roentgen Signs of Increased Lead Absorption**—Senturia discusses the 6 case reports found in the literature which describe roentgen changes of retained lead projectiles. He reports 2 cases which have recently come under his observation. Recently Key also reported roentgen changes due to increased lead absorption. A critical study of the roentgen changes suggests that absorption from the retained missile can occur and that poisoning may supervene. The changes consist in a definite alteration in the missile itself in that there is fragmentation, disintegration and apparent infiltration. The roentgen demonstration of such a transformation does not always coincide with a clinical diagnosis of lead poisoning, but it does indicate that absorption in sufficiently large quantities is a potential danger. Signs of saturation of the tissues with lead have been confirmed by analyses of specimens removed at operation and necropsy. Infantry shot and shrapnel which consist for the most part of lead are more likely to result in disintegration and absorption than are fragments of grenade or splinters of an aerial bomb which consist mainly of steel. Of the 9 cases discussed by the author all but 1 were in bone and adjacent to an active joint. It has been suggested that the constant motion of the articular surfaces is responsible for the disintegration of the bullet. Projectiles which remain embedded in soft tissue have not been known to show these changes. They soon become encapsulated and innocuous. The part that the synovial fluid plays in the solution of the lead would seem to warrant investigation. The interval between the gunshot wound and the onset of clinical symptoms of lead absorption in the 9 patients varied from one to twenty-two years. Individuals known to have retained projectiles of lead adjacent to active joints should have serial

roentgen examinations to detect changes as they occur. Obscure and unexplainable symptoms referable to the blood, gastrointestinal tract or nervous system may be solved by this means.

**Bone Infarcts**—Kahlstrom reports the occurrence of bone infarcts in a caisson worker and in 4 persons who have not been exposed to compressed air. While microscopic proof is lacking in these cases, the roentgen features are similar to those in which biopsy and necropsy studies were made. Three of the 4 patients had arteriosclerosis and 1 had neither a history of caisson disease nor evidence of arteriosclerosis.

### Rationale of Oxygen Therapy During Fever Therapy

—The arterial oxygen tension is reduced when hyperpyrexia is present. The administration of oxygen, Cullen and his colleagues point out, prevents this reduction and may explain the clinical benefit derived from the therapy.

**Effect on Blood Vessels of Anesthesia**—Seldon and his co-workers observed the changes in the minute peripheral blood vessels of the ear of the rabbit produced by anesthesia with pentothal sodium, cyclopropane nitrous oxide, ethylene and ether. The vessels observed had grown into the transparent chamber of a Clark window inserted in the animal's ear. With pentothal sodium there was a sustained decrease in the systolic blood pressure and a sustained increase in the diameter of the arterioles and capillaries. When cyclopropane and oxygen were used there was a sustained increase in the systolic blood pressure, the diameter of the arterioles was decreased and the diameter of the capillaries was increased. When nitrous oxide and oxygen were employed there was a sustained increase in the systolic blood pressure, and the diameter of the arterioles and capillaries was decreased. When ethylene and oxygen were used there was a slight increase in the systolic blood pressure and the diameter of the arterioles and capillaries was decreased. When ether was administered by the drop method there was an increase in the systolic blood pressure, a decrease in the diameter of the arterioles with an apparent increase in the velocity of the blood stream through them and a decrease in the diameter of the capillaries with a decrease in the velocity of the blood stream through them. Ether and ethylene employed separately produced fairly similar results. The study suggests that the increase in the oozing of blood noticed in patients operated on under pentothal sodium anesthesia could result from the increase in the diameter of the arterioles and the capillaries caused by the anesthetic.

**Early Recognition and Treatment of Shock**—Drew states that there are three defects in the peripheral vascular tree which need to be corrected in surgical shock. They are arteriolar and venular constriction, capillary dilatation and stasis of circulatory fluids in the capillary bed or loss into the tissue. For the correction of these defects the following is recommended: 1 To aid the restoration of the electrolyte balance acid base equilibrium, normal arteriolar tone and circulatory volume, intravenous sodium chloride at first in isotonic form and then in hypertonic form if the former gives no response should be employed. 2 Capillary tone may be restored by using water soluble adrenal cortex extract in quantities sufficient to get a response in blood pressure. 3 The circulation may be sustained by adequate amounts of blood or plasma.

**Cardiac Lesions and Rheumatic Fever**—From 2,300 consecutive necropsies Console selected all those giving clinical evidence of rheumatic fever, verrucae, acute pericarditis or chronic endocarditis. Aschoff bodies were accepted as unequivocal evidence of the disease. Of 98 cases with both clinical evidence of rheumatic fever and lesions of the endocardium or the pericardium, Aschoff bodies were present in the myocardium in 28. The interval between the last attack of polyarthritis and death in 27 was five months or less and in 71 from five months to thirty-six years. Aschoff bodies were found in all in which death occurred during the first decade of life, in 64 per cent of those dying during the second decade and in 11 per cent of those dying during a later decade. When Aschoff bodies were found in the myocardium (28 cases) with 1 exception the interval between the last attack of polyarthritis and death was five months or less. A curve of the frequency of death of patients with symptoms of rheumatic fever and cardiac lesions shows two distinct peaks—one in the first decade of life, corresponding with deaths from cardiac failure and the presence of Aschoff bodies in the myocardium, and the other between the ages of 40 and 60 years, associated with cardiac failure, deforming lesions of the valves and absence of Aschoff bodies. Minor degrees of valvular deformity were predominant in the first three decades of life, advanced deformity was common in the later decades. Valvular deformity increased with the duration of the disease after the onset of symptoms, but it had no constant relation to the number of attacks or to the age at onset.

**Staphylococcal Infection**—Experiments to determine the effectiveness of chemoserotherapy in the treatment of severe staphylococcal infection of mice and rabbits were carried out by Kolmer and Brown. The newer staphylococcus antitoxin and a sulfonamide drug appear to have an important synergistic action. Sulfathiazole and sulfathiazoline and then sulfapyridine and sulfadimethylpyrimidine have proved most effective in the treatment of experimental *Staphylococcus aureus* infection in mice. The complete cure of mice was not indicated by the survival rate, as varying percentages of mice which survived for twenty-one days have shown the presence of pyemic renal abscesses. However, there was a relation between the survival percentage and the incidence of renal abscesses. The simultaneous administration of staphylococcus antitoxin and a sulfonamide (chemoserotherapy) has given better results than therapy with one of the agents. Sulfathiazole and sulfapyridine were most effective for the treatment of staphylococcal septicemia in rabbits. All animals that survived for eighteen days, however, had pyemic abscesses of the kidneys or other organs, so that survival alone was not an index of complete cure. Sulfapyridine was also somewhat effective for the treatment of local lesions produced by the intradermal injection of *Staph. aureus*. It is concluded that the chemotherapy of staphylococcal infections is still unsatisfactory and inferior to sulfonamide therapy in hemolytic streptococcus and pneumococcal infections.

**Sulfonamide Compounds**—Martin and his co-workers used 7,000 white mice to study the effect of the therapeutic and prophylactic detoxication of sulfanilamide, sulfapyridine and sulfathiazole. The toxicity of sulfanilamide was reduced from 20 to 40 per cent by the simultaneous administration of a single dose of a compound used by the body in the general processes of detoxication. Calcium glucuronate was the most efficacious detoxifying compound. A combination of aminoacetic acid, cystine, calcium glucuronate and ascorbic acid provided the most consistent and the greatest protection. The reduction in toxicity had no effect on the chemotherapeutic efficacy of sulfanilamide. On the contrary, it appeared that the antistreptococcus activity was slightly but definitely enhanced. There was a difference in the percentage of death rates of approximately 10 in the 3,000 mice used. The possibility that decreased absorption may have been a factor in decreasing toxicity was disproved in experiments on dogs. When the detoxicant was given with sulfanilamide, absorption was increased to approximately 10 per cent, which possibly may be a factor in enhancing the chemotherapeutic efficacy of sulfanilamide. The acute toxicity of sodium sulfapyridine was reduced by as much as 50 per cent by the simultaneous admission of detoxifying chemicals. Aminoacetic acid and ascorbic acid were the most effective single detoxifying chemicals. Again, the presence of a detoxifying chemical distinctly prolonged the survival period of mice, and the detoxicant did not decrease the speed of absorption or the maximal concentration of sulfapyridine. For sulfathiazole, cystine and aminoacetic acid exerted the greatest effect in combating intoxication. Likewise animals receiving detoxifying chemicals with the sulfathiazole survived longer, and the speed of absorption was not altered by administration of a detoxifying chemical.

**Equine Encephalitis in Man**—Baker and Noran studied in detail 10 human cases of western equine encephalitis of the 1941 epidemic, 5 of the patients died. Of the fatal cases, the virus was isolated in 1 and neutralizing antibodies were found in the serum in another. Similarity of the pathologic lesions in all the fatal cases and their resemblance to the lesions in the horse leaves no doubt as to nature of the disease. Neutralizing antibodies were detected in only 1 of the 5 nonfatal cases. Nevertheless, the similarity of the clinical features and the occurrence of cases among farmers from nearby localities where equine encephalitis was prevalent makes the diagnosis highly probable. The clinical features of the disease such as sudden onset, generalized headache, nausea, fever and lethargy are surprisingly consistent. After a week or two the symptoms subside. About 10 per cent of the patients die. The neurologic signs are nuchal muscular weakness and hyporeflexia. The spinal fluid shows moderate pleocytosis, with predominance of the mononuclears. In the fatal cases, lesions are scattered throughout the nervous system, especially in the basal nuclei. The histopathologic changes are characterized by suppurative inflammatory elements. Polymorphonuclears are common and form focal, diffuse and perivascular infiltrations. Mononuclear cells may be prominent. Perivascular and scattered areas of demyelination are present and shadow the inflammatory lesions.

**Myasthenia Gravis**—From a review of literature on the association of a thymic tumor or enlargement of the thymus with myasthenia gravis, it appears to Campbell and his co-workers that the high incidence (approximately 50 per cent) of pathologic changes in the thymus is more than coincidental. Seven patients with myasthenia gravis were encountered at the Albany Hospital in the last six years and roentgen evidence of mediastinal tumor was observed in 3. The thymoma of 2 was removed at operation in 1 successfully and in 1 unsuccessfully. It appears probable that the thymic abnormalities may in some way be related to myasthenia gravis. Thymic tumors may bear a primary causal relation to myasthenia gravis or they may be secondary or associated causes as the goiter is frequently in acromegaly. The remission of symptoms which has been reported to follow thymectomy in 3 cases in the literature and in their case may be cited as evidence of a primary causal relationship. Although unconfirmed the experimental work of Adler, who produced myasthenia in dogs by injecting thymus extract and relieved the symptoms by prostigmine, is additional suggestive evidence. On the other hand the pathologic changes in the thymus may not be the sole cause of the disease, as they are absent in the other half of the cases. Furthermore, although the thymoma was completely removed in 1 of the authors' patients the myasthenia gravis persisted although in a milder form. Observations thus far available militate somewhat against thymic tumor and hyperplasia as the sole primary cause of myasthenia gravis.

**Electrically Induced Convulsions for Functional Psychosis**—Edlin induced convulsions with the Offner electric shock therapy apparatus in 126 cases of functional psychosis. The duration of the disorder before treatment ranged from less than six months to ten years and included all the functional psychoses with the exception of manic depressive psychosis. Patients who were ill for less than six months showed a 52.63 per cent recovery rate, and the rate for those affected from six months to one year was 30.76 per cent, for those ill from one to five years it was 21.05 per cent and for those ill from six to ten years it was 20 per cent. The greatest percentage of recoveries was shown by patients suffering from involutional melancholia. The next largest recovery rate was shown by patients with catatonia, and then those with hebephrenia and dementia precox combined with hebephrenic and catatonic features. The results as with convulsive therapy with metrazol and insulin, show that the duration of a psychosis is important from a prognostic point of view. The author prefers electrical to metrazol therapy because of the high percentage of recoveries and the almost total absence of fear. Psychotherapy is a necessary and vital adjunct to electrical therapy.

**Six Hour Pregnancy Test**—Salmon and his associates describe a six hour test for human pregnancy which is based on the observation that the chorionic gonadotropin causes a decided hyperemia of the ovaries of immature rats. The hyperemia is grossly discernible six hours after the injection of urine from pregnant women. To perform this test 3 animals weighing from 35 to 45 Gm are injected with 2 cc of the first morning specimen of urine and a necropsy is held at the end of six hours. Positive results were obtained in all but one of seventy-eight tests of pregnancy urines and negative results in all of the thirty-one tests of urine specimens from nonpregnant persons. A confirmatory twenty-four hour test based on

the proliferation of the epithelial and muscular elements of the vagina of the immature rat induced by the estrogens present in the pregnancy urine, is also described. Such confirmation is unnecessary as soon as one becomes familiar with the six hour ovarian vascular reaction.

**Central Nervous System in Epidemic Encephalitis**—Weil and Breslich compared the histopathologic changes of the brains from 9 patients of the 1941 epidemic of encephalitis with those of other types of epidemic encephalomyelitis. In both the St Louis and the North Dakota epidemics the peculiar type of inflammatory reaction consisting of the combined proliferation of perivascular round cells and glia and the type of distribution of the inflammatory reaction throughout the brain with its maximal intensity in the basal ganglions and the midbrain were common. The two diseases are differentiated by the presence in the North Dakota epidemic of areas of tissue necrosis in the gray and the white matter of the brain. This fact calls for a comparison of this type of encephalitis with that following measles in which areas of severe necrosis around blood vessels of the white matter with destruction of axis cylinders, myelin sheaths and glia are found. The decided astrogliosis in the North Dakota cases, absent in the measles type, should not be described as an area of "demyelination." Microscopically the perivascular hemorrhages do not justify a classification of the North Dakota encephalitis as an "acute hemorrhagic leuko-encephalitis." Perivascular hemorrhages may be found in any type of acute encephalitis, especially that following scarlatina, influenza, pneumonia and bacteremia.

**Infundibuloma**—Globus describes for the first time a tumor derived from the neurohypophysis. It simulates the structure of the infundibulum including the neurohypophysis, and its vascular pattern is common to its site of origin—the infundibular region. The name infundibuloma, indicating its origin and its microscopic character, is suggested. Failure to find some relationship of this tumor to phylogenic remnants of the saccus vasculosus does not obviate the fact that it is an infundibular and autochthonous neoplasm. Two cases are reported.

**Traumatic Degeneration of Spinal Cord**—Hassin believes that trauma should be included with intoxications and infections as a possible cause of chronic degenerative disease of the central nervous system. Trauma as an etiologic factor is often looked on with suspicion and with even incredulity unless there is a definite history of a broken skull or neck. It is probable that the clinical features of degenerations caused by some form of trauma (concussion and contusion) only resemble the classic degenerative entities, such as amyotrophic lateral sclerosis, but are not identical with them. They are morbid entities, differing from the classic nontraumatic forms both pathologically and clinically. Thus a so-called incomplete form of amyotrophic lateral sclerosis, characterized solely by muscular atrophies and spasticity and no bulbar phenomena, may be produced by inflammatory, degenerative, neoplastic or granulomatous processes, fractures, dislocations, contusions and con-

cussions of the cervical region of the spinal cord. The subject of spinal concussion is controversial because reliable pathologic observations are lacking, but some of the greatest clinicians considered trauma as a significant cause of disturbances of the central nervous system. Studies of many cases of his own and those from the literature cause the author to believe that concussion is an unquestionable factor in the causation of disorders of the central nerve which, under certain circumstances, may resemble those of progressive muscular atrophy, amyotrophic lateral sclerosis, multiple sclerosis and other conditions, differing from them not only clinically and pathologically but also in their course. The suggestive pathologic features of degeneration of the cord due to trauma are foci of softening combined with degeneration of the anterior horn cells and the long fiber tracts, and in early stages with areas of rarefaction. The changes are analogous to those occurring in concussion of the brain. Mild traumas leading to degeneration are compatible with life, severe traumas are usually rapidly fatal, and there is no time for neural degeneration and the full development of signs and symptoms to appear.

Whole Bovine Plasma and Serum—Kremen and his associates evaluated the usefulness of whole bovine plasma and serum in man, studied the items contributing to reactions with their use and determined the effect of their proteins on the nitrogen balance of man. In order to eliminate the fibrinogen fraction, serum rather than plasma was used. The 120 patients selected for trial on bovine plasma and serum have been usually restricted to those with inoperable carcinoma, and then only those were given bovine plasma or serum who had only a slight or a negative cutaneous reaction to a preliminary cutaneous test. In the groups given whole plasma or serum the incidence of immediate reactions was 58.3 and 66.6 per cent respectively. When bovine serum was adsorbed on human erythrocytes the incidence of reactions was 24.5 per cent in 53 patients. Kaolin as an adsorbing medium did not remove any of the hemolysins or hemagglutinins. On two occasions bovine plasma was used for shock, 1 patient with a bleeding ulcer was given 300 cc of bovine plasma intravenously and the blood pressure was raised from 80 systolic and 40 diastolic to 130/90 and the other patient was given 500 cc of bovine serum and his blood pressure was raised from 90/70 to 110/80. Positive nitrogen balance can be attained by the intravenous administration of human plasma and can be approached closely with whole bovine plasma. The preparation of a satisfactory product of bovine albumin free from the globulin fraction may prove a safe and practical blood substitute. The incidence of reactions, although not severe is sufficient to contraindicate its clinical use at the present time.

Experimental Traumatic Shock—Blalock studied the effect of heat or cold applied to the injured part of animals in experimental shock produced by gross trauma to an extremity. Only large animals were used and pain was prevented by suitable anesthetic agents. Usually the animals were observed until they died. The results do not indicate that local cooling of the injured part would lessen the escape of blood and fluid into the traumatized area and the adjacent tissues. It is possible that the escape of fluid into the injured tissues would have been lessened had the part been cooled more rapidly. The average survival period of the animals in the group in which cold was applied was twice that of the group in which the body tempera-

ture was elevated by the local application of heat. It would appear that extreme degrees of heat should not be used even locally in the treatment of shock, particularly if means are not available for increasing the blood volume by blood or a suitable substitute. The patient who has been exposed to cold and moisture should be placed in a warm bed and covered with blankets. On the other hand, the indiscriminate use of hot water bottles and other heating devices may harm rather than improve the general condition of the patient.

Peptic Ulcer in Meckel's Diverticulum—Two cases of peptic ulcer in Meckel's diverticulum are reported by Waugh and his co-workers. Careful gross and microscopic examination of the specimens removed at operation revealed that intrinsic intestinal obstruction had developed in the ileum as a result of the inflammatory reaction associated with active ulceration in or near the diverticulum which contained gastric mucosa with typical parietal cells. This type of obstruction is similar to that occurring in the duodenum secondary to peptic ulceration. It is distinct from that usually associated with a complicated Meckel's diverticulum which is of an extrinsic or mechanical nature and which results from the formation of adhesions and inflammatory exudate about a Meckel's diverticulum which has perforated, with the subsequent occurrence of peritonitis. The 2 cases are probably the first to be reported in which proved peptic ulcer in Meckel's diverticulum resulted in intrinsic intestinal obstruction.

Malignant Adenoma of Lung—Adams and his colleagues report 5 cases of endobronchial tumor. The neoplasm is characterized by a long clinical course with low grade but definite malignant manifestations. Differentiation of the benign from the malignant epithelial tumor of the bronchus is not possible from bronchoscopic biopsy material, as no criteria are obtained as to the amount of tumor invading the surrounding structures or as to the presence of distal metastasis. In treatment it must be assumed that the tumor is malignant or potentially malignant and should be removed by lobectomy or pneumonectomy, preferably lobectomy if all the tumor bearing tissue is removed. Sections for microscopic study should include the entire tumor.

Acute Renal Hypertension—Quinby and Simeone studied the immediate effects of short lasting but total ischemia of the kidney in 10 cats and 7 dogs. A rise in blood pressure followed release of acute renal ischemia in 5 of the cats and the 7 dogs. Pressor effects were obtained by total occlusion of the renal arteries for as short a time as three minutes. Ischemia of greater duration than ten minutes did not increase the degree or duration of the pressor response when the occluding clamps were released. A mean arterial pressure of at least 50 to 60 mm of mercury was necessary to insure a detectable flow of blood through the kidney. Hypertension was produced without a demonstrable effect on the stroke volume or the rate of the denervated heart in animals from which the adrenal medullas were removed. The experiments suggest a convenient technique for studying renal hypertension.

**Obstruction of Stomach**—A case of complete congenital obstruction of the stomach by a mucosal cyst in a newborn infant which was successfully operated on the third day of life is presented by Metz and his associates. The cyst was gastric in origin and probably the result of the formation of two septums in the stomach. The operative technic consisted in reestablishing the lumen through the stomach by perforating the walls of the cyst. The boy at 3 years and 2 months of age was 3 feet 6 inches (107 cm) tall, weighed 38 pounds (17 Kg) and was in excellent health. A roentgen examination with a barium sulfate meal showed the stomach to be normal in size and shape with no evidence of a filling defect. The pylorus was patent and appeared to be functioning normally.

New Bipolar Spot Coagulating Electrode for Neuro and General Surgery M. A. Glaser, Los Angeles—p. 171

**Duration of Pregnancy**—In an effort to determine the length of pregnancy, Arnot reviewed the history of the pregnancies of 3,606 patients and found the length to be two hundred and eighty and eight-tenths  $\pm$  ten and two-tenths days. Of the patients 53.5 per cent delivered later than the expected date of confinement, 42.44 per cent delivered before and only 4.07 per cent delivered on the estimated date. The average number of days late was eight and twenty-four hundredths and the average days early was eight and fifty-six hundredths. There was a tendency for women with menstruation cycles of less than twenty-eight days to deliver early and those with longer cycles to deliver late. Apparently in some women a mature child develops sooner than in others. There was a definite tendency for women to be consistent in the onset of their labors; if they were late with one baby they were apt to be late with subsequent babies, and vice versa. The baby's weight alone will not accurately determine prematurity or postmaturity. For uniformity, it is suggested that in using Naegle's rule one first count back three months from the last menstruation and then add seven days.

**Inversion of Uterus**—Salvin reports the occurrence of acute inversion despite the fact that every procedure was done according to the best accepted obstetric methods and good management. An etiologic factor was not present. The placenta was not adherent, labor was not difficult, the cord was of normal length, no traction was made on the cord and no undue pressure was exerted on the fundus. There was no evidence of uterine inertia. It was assumed that the patient would have had the inversion under any circumstances, and on the basis of the literature and the accepted classification (mismanagement and spontaneous) the inversion was called spontaneous. Accurate data on acute inversion was acquired by observing a supervised herd of cows which reflected facts on the issue of mismanagement. In the herd observed the ratio of inversion was 1/517 births. More than 90 per cent delivered themselves without an attendant, and the percentage of inversion among them was no greater in those needing assistance. Acute inversion was infrequent in primiparous cows except after abortion. As the cord breaks when the calf is born, traction on the cord had no relation to inversion, nor did an adherent placenta and its removal, inertia of the uterus, persistent contraction, shock or hemorrhage. Mismanagement played an insignificant part in the production of acute inversion in cows.

**Massive Arsenotherapy of Syphilis**—Since January 1940 Sadusk and his co-workers have used mapharsen by the continuous intravenous drip for the treatment of 33 patients with early primary and secondary syphilis. The patient received 0.24 Gm of mapharsen daily, or a total of 1.2 Gm during the five days. Primary fever of 101 F or higher occurred in 14, secondary fever of 101 F or higher in 10, toxicodermata at the end of therapy in 7, jaundice in 1, peripheral neuritis evidenced by paresthesias in the lower extremities during the second or third week following therapy in 18, nausea and vomiting (more often in the female) in 29, slight pain of a cramplike nature in the arm and forearm of the injected extremity in practically every patient, a moderately severe local thrombophlebitis of the forearm (usually on the fourth or fifth day of therapy) in 8, a leukocyte count falling to less than 5,000 at the end of therapy or shortly thereafter in 2, late secondary anemia, which usually reached its peak by the first or second week following therapy in 11, and electrocardiographic changes before, during and after therapy were frequent. The changes were abnormalities of the T waves. Other toxic reactions, convulsions, coma, hemorrhagic encephalitis and exfoliative dermatitis, were not observed. Nine teen of the 33 patients, receiving thirty-six "treatment courses," have had a complete reversal of their serum. The other patients have been followed for less than six months after therapy. The rate at which the serum of the 19 patients became negative varied from four to twenty-eight weeks after treatment. Four of the 33 patients have been lost for further observation. The serum of 2 of them was negative on the fourth and third week respectively, while the Wassermann reaction of the 2 others had reverted to negative by the ninth week though the Kahn test was still positive. Patients who are retreated do not necessarily acquire any sensitivity to arsenic during the first course of treatment. In fact the toxic reactions seen during the first course of treatment in the 3 patients who were retreated did not necessarily occur with the second course. Two patients became pregnant within eight weeks and fourteen weeks respectively after treatment, at which time their serologic reactions were still positive, no further antisyphilitic treatment was given and both were delivered of normal full term infants.

**Electrocardiogram and Massive Arsenotherapy**—Geiger and his associates obtained serial electrocardiograms before, during and after massive arsenotherapy in 23 cases of early primary or secondary syphilis. The changes were concordant diminution of the amplitude of the T wave in all leads and frequent inversion of the T wave in leads other than the third. The effects were most pronounced toward the end of treatment or immediately thereafter, however, all the changes returned to pretreatment values within a few weeks. The electrocardiographic changes were not related to the Hershheimer reaction, secondary fever or vomiting. It is probable that the abnormalities represented toxic arsenic effects of a transient and benign nature.

Avitaminosis in Apparently Healthy Trinidadians K V Earle—p 255  
Psychosis Associated with Vitamin B Deficiency E Slater—p 257

**Incidence of "Fainting" in Blood Donors**—Greenbury studied the extent that age, sex, occupation, fatigue and lack of food had on the incidence of fainting in 5,897 blood donors (4,137 were female). The combined fainting rate for the sexes was 4.93 per cent. The incidence declined with age for both sexes, excepting for men 36 to 45 years of age. For men less than 45 the rate is significantly greater than for those more than 45, and for women less than 35 the incidence is significantly higher than for older women. Except for the 36 to 45 year group the incidence of fainting is greater among women, and in the 18 to 25 year group the difference reaches statistical significance (more than 20 to 1). The incidence of fainting was higher among clerical workers than among other groups, such as domestics and factory groups. The figures with regard to the effect of hunger and fatigue on the incidence of fainting give little information. However, there is a strong impression that hunger and fatigue are contributory causes. It is not improbable that the high incidence of fainting among clerical workers is due to the fact that because of conscription they are below the normal physical standard.

19 33-56 (Feb) 1942

- \*Nonarticular Rheumatism in the Army—Symptomatology. Etiology. Treatment. J H Hutchison—p 33

**Nonarticular Rheumatism in the Army**—During seven months Hutchison encountered 78 cases of nonarticular rheumatism in a military hospital. Such cases, whatever their nature, are curable and they do not require prolonged hospital treatment. Frequently men with nonarticular rheumatic manifestations are kept off duty too long. In the diagnosis of fibrositis if two of the three signs—well defined tenderness, spasm, nodule formation—are not present it can be assumed that the case is not one of active fibrositis. The average hospitalization period of 54 patients with fibrositis was twenty days, and every patient was returned to duty. Thus, when properly diagnosed and treated fibrositis should rarely be the cause of prolonged invalidism. Sciatica was less common but more serious, there were 6 cases. True sciatic neuritis can be differentiated from pain of sciatic distribution due to fibrositis by the absence or the diminution of the ankle jerk on the affected side, wasting and hypotonia of the thigh and the calf and occasionally analgesia of the upper and outer side of the foot. The average hospitalization in the 6 cases was thirty-nine days. Rheumatic infection, arthritis or gout was present in the remaining 18 cases. The precipitating factors in fibrositis were sudden strain, wear and tear, infection and sepsis, chilling and psychologic factors. Rest is always necessary in the treatment of fibrositis and sciatica. Heat is an invaluable adjunct for the relief of pain. Massage and heat form the most generally successful treatment for fibrositis. In sciatica massage should be employed cautiously and only in the later stages. Drugs for relieving pain are required in every acute case. The relief of pain following the injection of a local anesthetic in 22 cases was dramatic and rapid, and the power of movement returned. In chronic cases pain and stiffness were lessened. After the injection physical therapy should follow. The injection method may be used as a diagnostic aid, as it does not relieve pain of psychogenic origin.

**Pregnancy in Patient with Chronic Hypertension**—Browne and Dodds present histories of two hundred and thirty-nine pregnancies in 222 hypertensive patients. Only women under their care before the twentieth week of pregnancy are considered. Exacerbation, albuminuria, edema and the like occurred in 17.9 per cent of the pregnancies. If a rise in blood pressure from that before pregnancy alone or with edema were taken as evidence of exacerbation, this occurred in 82 per cent. There was no exacerbation in 17 per cent. There was no evidence that patients in whom an exacerbation occurred with albuminuria, edema and other signs of preeclamptic toxemia were suffering from occult or latent nephritis or that their underlying hypertension was fundamentally different from that in those who had no exacerbation or from those who had a further rise in blood pressure. Exacerbation seemed more likely in patients 30 or more years of age than in those less than 30. The fetal and neonatal mortality was 16.2 per cent. Intrauterine death of the fetus was often preceded by albuminuria but it also occurred when albuminuria was absent, especially if the systolic blood pressure rose to 160 or more millimeters. The same was true of spontaneous abortion and premature labor. If a patient's blood pressure at the start of her pregnancy was 150 systolic and 100 diastolic she had a 32 per cent likelihood of a successful pregnancy and of giving birth to a living and viable child. Tests of renal function were of little prognostic aid. The most valuable seemed to be the blood urea. If at the start of pregnancy this was 30 or more mg per hundred cubic centimeters, the chance of a living and viable child was small.

Minor Surgery VIII The Feet H L C Wood—p 177

**Water Deficiency in General Practice**—Micks states that the general practitioner, although he rarely treats dehydration, may by intelligent anticipation often prevent it from reaching the stage at which intravenous infusion is necessary, for example when the administration of sulfapyridine has to be pushed to the extent of producing vomiting, measures to combat dehydration can be instituted at an early stage. The parenteral administration of saline solution to such patients maintains a high output of urine. Infantile diarrhea rapidly produces collapse. In such cases the only satisfactory route may be the intravenous one and a matter for experts, and the practitioner who saves most cases of infantile diarrhea anticipates the need for special treatment by sending his patients early to a properly equipped children's hospital. The practitioner may have to treat diabetic coma in the patient's home. Some hundreds of units of insulin may be needed in a short time with saline solution rectally or orally, and he must resolve not to leave the house until recovery has begun. Diabetic coma is best treated in the hospital, but when this treatment is not available even an inexperienced practitioner can do much if he remembers that the two "specifics"—insulin and isotonic solution of sodium chloride should be given at once in abundance. Hypoglycemia need not be feared at first, as it takes many hours and much insulin to produce hypoglycemia in a comatose patient.

**Influence of Cooking Utensils on Destruction of Vitamin C**—Fleisch determined by titration the loss of vitamin C in milk, potatoes, kohlrabi, cauliflower and apricots caused by cooking in different types of kitchen utensils. A noticeable influence is already exerted by the length of time required until the boiling point is reached. The longer the time, the greater the destruction of vitamin C. Since pyrex has a poor heat conduction capacity, its destruction of vitamin C is greater than is the case in aluminum utensils. The destruction of oxydases by the cooking process does not prevent or reduce the destruction of vitamin C after the cooking process. This was ascertained over a period of twenty-four hours. When milk is heated in utensils of various materials for the same length of time, vitamin C destruction is least in pyrex, then follow aluminum, well tinned copper utensils, enamel ware, enameled cast steel and badly tinned copper. However, if the utensils of various materials are heated with the same flame intensity and if cooking of the food is continued to the same degree of doneness, poorly tinned copper, pyrex, enameled cast steel, double boiler and particularly the fireless cooker all destroy more vitamin C than does aluminum. This applied to all the aforementioned foods.

- \*Diethylstilbestrol Dipropionate in Hyperplasia of Prostate J E Colon—p 41

**Diethylstilbestrol Dipropionate in Hyperplasia of Prostate**—Colon treated 9 cases of benign prostatic hyperplasia by intramuscular injections of diethylstilbestrol dipropionate. One mg in oil was administered for six injections. In 2 cases of fibrous and fibromuscular hyperplasia, respectively, the first series of injections was followed by a second series of weekly injections of 3 mg for five injections. The patients were treated at the same time with prostatic massage. In 5 cases the size of the prostate gradually diminished to normal. The patients void normally and show no residual urine or prostatic symptoms. The size of the prostate diminished in the 2 cases of hyperplasia with fibrosis and fibromuscular prostatic disorder, respectively. They void without difficulty but show some residual urine. All the patients were observed for several months after conclusion of the treatment and were found to be relieved of the symptoms.

- Investigations on Hereditary Biologic Factors in Development of Homosexuality T Lang—p 961
- \*Eosin in Local Treatment of Psoriasis Vulgaris R Wernsdorfer—p 965

**Spinal Puncture and Insulin in Treatment of Bronchial Asthma**—Graeber points out the importance of differentiating between the treatment of the acute attack and the interval stage of asthma. Spinal puncture can be employed only in the acute attack. The method was employed two decades ago by Schultz, who assumed that the hydrostatic pressure conditions in the central nervous system may play a part in bronchial asthma. The author has practiced spinal puncture so far in 13 cases of

the allergic type without an essential cardiac component. The amount of fluid withdrawn varied between 15 and 25 cc, depending on the pressure. Favorable results were obtained in 7 of the 13 cases. Improvement was obtained in 3 cases, and the puncture was without any effect in the remaining 3. Spinal puncture should be employed only after the customary symptomatic remedies have failed. Repeated punctures offer little prospect of success. The mode of action of spinal puncture has not been explained. Insulin therapy was resorted to in 3 cases. Insulin has two distinct effects on the asthmatic patient. Protracted treatment with gradually increased doses has little effect on the bronchial asthma as such but exerts a favorable effect on the general condition and indirectly on the asthma. Insulin therapy here is employed as an adjuvant in every stage of asthma. The general condition is the decisive factor in the selection of patients for this treatment. The second form is insulin shock therapy with large intravenous or intramuscular doses. This is a formidable procedure and should be resorted to only in cases refractory to all other forms of treatment. Intercurrent infections with high fever (facial erysipelas, lacunar tonsillitis and pneumonia) effected cure in 3 severe and refractory cases of asthma.

**Eosin in Local Treatment of Psoriasis Vulgaris**—Wernsdorfer employed a mixture of eosin, chrysarobin and salicylic acid, either in an ointment base or in alcohol, in the treatment of patients with psoriasis. This was followed by irradiation with ultraviolet rays, at a distance of 60 cm, on the first day for five minutes but on later days for eight or ten minutes. This method is more effective in a much shorter time than the customary medicaments. The photodynamic action of eosin is discussed.

- Bilateral Pneumothorax V Cepulic—p 837
- Laryngeal Tuberculosis E Wessely—p 841
- \*Changes in Pulmonary Vessels in Pneumonia M Fessel—p 843

**Changes in Pulmonary Vessels in Pneumonia**—Fessel shows that in the course of pneumonia pulmonary vessels, particularly the arteries, may develop inflammatory processes which lead to partial destruction of the wall and to narrowing of the lumen partly by endarteritic proliferation and partly by fibrin deposits and formation of thrombi. Such arterial changes have been observed in influenzal pneumonia and in the partial purulent breakdown of pulmonary tissue. Little attention has so far been given to the arterial inflammation which recurs after pneumonia has resolved. These changes are of vital importance for the function of the pulmonary circulation. Pneumonia accompanied by extensive interstitial inflammations on the arteries has a high mortality, but occasionally the patient survives. The majority of such patients have residual lesions left by the pneumonic process, such as pleural adhesions, callous indurations of the interstitial connective tissue and even calcification. In such instances it is not difficult to establish a relationship between the old vascular changes and the pneumonia. The author had the opportunity of examining such cases. He detected old cicatrized arterial lesions with chronic aneurysmatic dilatations and partial regeneration of the musculature which recall the picture described by Jaeger as the healed form of periarteritis nodosa. There are also cases in which the pulmonary parenchyma exhibits no permanent changes and in which except for the thickening of the interstitial tissue, the old vascular changes give the impression of an independent lesion. Cases of severe stasis in the pulmonary circulation are erroneously ascribed to an obscure, apparently independent, disease of the peripheral pulmonary arteries. Many cases which have been designated as primary pulmonary sclerosis, isolated endarteritis pulmonalis or thromboarteritis pulmonalis can be identified as an old and occasionally a relapsing pneumonic process. Not all such cases can be traced to a previous pneumonia. Other conditions that can elicit these or similar pictures are hematogenic-purulent, rheumatic or syphilitic inflammation of the vascular wall, periarteritis nodosa and Wasmann's periarteritis obliterans.

## Book Notices

**Advances in Colloid Science.** Edited by Elmer O. Kraemer, Ph.D. Biochemical Research Foundation of the Franklin Institute, Newark, Delaware. In collaboration with Floyd E. Bartell, Ph.D., Professor of Chemistry, University of Michigan, Ann Arbor, and S. S. Kistler, Ph.D., Associate Director of Research, Norton Company, Worcester, Mass. Volume I. Cloth. Price \$5.50. Pp. 434 with 161 illustrations. New York: Interscience Publishers, Inc. 1942.

It is unfortunate that a book such as this, possessing world-wide interest and for which subject matter should be drawn from all countries must be published when political conditions limit the sources. Nine of the twelve contributions emanate from American laboratories, all are written by competent leaders in each field described.

This collection of papers is not proposed for use as a textbook nor is it a general survey of the field of colloid chemistry. Rather, it is a series of subjects related to one another only in that each is a manifestation of colloidal phenomena. The authors give the detailed theoretical and experimental background for their subjects, description of results, comparison with theoretical results and conclusions regarding the value of the experiments. The papers are not reviews or compilations from the literature but represent original, individual work.

P. H. Emmett describes a method and apparatus for the determination of surface areas of particles by adsorption isotherms, while R. R. Sullivan and K. L. Hertel use the permeability method to determine surface area of fibers and powders. A. Tiselius gives a modification of adsorption analysis based on the determination of specific retardation volumes. The theory of detergency and comparisons of commercially available detergents under varying conditions is given by J. W. McBain. An excellent review and discussion of recent work on the structure, physical and chemical properties, enzymatic degradation and color reactions of starch is given by K. H. Meyer. R. E. Powell and H. Eyring discuss the theoretical frictional and thermodynamic properties of large molecules such as cellulose derivatives and rubber. Conclusions concerning the structure of certain inorganic gels as derived from x-ray diffraction data are presented by H. B. Weiser and W. O. Milligan. A study of the creaming of latex, so important when many substitutes for hevea rubber are being sought, is presented by G. E. Van Gils and G. M. Kraay. The phenomenon of the production of double refraction during stress or movement of certain liquids, such as colloids, known as streaming birefringence is excellently described and conditions are discussed by J. T. Edsall. Zeolites and permutits have been used for many years in the purification of liquids such as boiler feed waters, because they possess ionizable groupings which may be exchanged for metallic ions in solution. It has now been found that certain synthetic resins also possess this property of ion exchange, thus opening a great new field in liquid purification. This problem and the possibilities of the method are presented by R. J. Meyers. No book on colloids would be complete unless it included applications of the electron microscope, which can magnify an object thirty thousand times, to this type of work. T. F. Anderson describes the mechanics, use, technique and some of the results obtained with the instrument.

The average reader who has not had specific training in the field of colloids may find the mathematical and theoretical treatment rather confusing, but one who is working or deeply interested in these subjects will find this collection of papers invaluable. The basic theorems in each case are sound, the bibliography is adequate and the printing and illustrations are excellent.

**Shock Treatment in Psychiatry. A Manual.** By Luebe Jessner, M.D., Ph.D., Resident Psychiatrist, Baldpate, Georgetown, Mass. and V. Gerard Ryan, M.D., Associate Psychiatrist, Elmerest Manor, Portland, Conn. Introduction by Harry C. Solomon, M.D., Clinical Professor of Psychiatry, Harvard Medical School, Boston. Cloth. Price \$3.50. Pp. 149. New York: Crane & Stratton, Incorporated. 1941.

This is a useful manual giving explicit directions for the administration of shock therapies for mental disturbances. It is valuable for those who plan to use these therapeutic procedures.

**Fatigue of Workers. Its Relation to Industrial Production.** By Committee on Work in Industry of the National Research Council. Cloth. Price \$2.50. Pp. 165. New York: Reinhold Publishing Corporation. 1941.

Present day events emphasize the importance of maximum production in industry. This monograph is concerned with some of the factors responsible for fatigue in industrial workers. Although it was written before the outbreak of the war, it is nonetheless up to date. The last decade has witnessed a rapidly accumulating literature and interest in this nationally important problem. The material is presented in a rather interesting manner representing "the testimony" presented before the committee. Testimony in this sense implies a report to the committee and by members of the committee of the accumulated knowledge on certain phases of this subject.

The monograph has value because it indicates in broad terms the complexities of industrial fatigue. It gives special emphasis to some of the physical, psychologic and sociological factors. Of importance to the medical profession is the summary by Dill of the effect of heat and high altitude. Dill's investigations were derived from an intensive study of the circumstances of work at Boulder Dam but the findings can be applied and have been applied to other circumstances of industry, such as obtain in steel mills and other places where high temperature is a factor. The likelihood of our military forces being occupied in tropical climates makes these studies important now. Studies on high altitude are included in this chapter and represent chiefly the results of investigations at Columbia University and in Chile. These investigations give some idea of the problems affecting aviation medicine.

Psychologic influences on industrial fatigue are illustrated chiefly by case reports and summary comments. The effect of social and psychologic environment is presented in the investigations carried on for many years in the plant of the Western Electric Company. The latter chapters are illuminating for any one who desires a comprehension of the many aspects of the fatigue problem.

This monograph serves to emphasize the increasing importance of engaging the attention of the medical profession from the point of view of the practitioner and of the research investigator, for the alleviation of fatigue. It indicates the significance to the medical profession of the influence of social, economic and psychologic factors on national health. The medical profession cannot remain aloof from this problem.

**Socorro médico aereo en ortopedia y traumatología.** Por Julio Piñeiro Sorondo, profesor adjunto de ortopedia de la Facultad de ciencias medicas de Buenos Aires. Prólogo del Profesor Enrique Finocchietto. Paper. Pp. 172 with 58 illustrations. Buenos Aires: Imprenta Sebastian de Amorruutu e Hijos. 1941.

This is a well conceived and excellently written book. Its publication at this time is extremely opportune, since the world is just beginning to realize how extremely small is our knowledge of medical aid by air. It is not designed for the research worker in aviation medicine but should be compulsory reading for all medical men in charge of civilian defense or relief agencies such as the Red Cross or Relief Wings.

The book divides naturally into four parts. The first consists of two chapters: one an introduction in which unfamiliar terms and expressions are defined and the other the history of the part played by South America and France in the development of this powerful ally in the struggle against death and disease. The second part is in three chapters, the first of which deals with the effect of flight on the patient from the point of view of a physicist. The second chapter is an adequate consideration of the prevention of anoxia and apnea. The third chapter considers the indications and contraindications for the transportation of patients by air. Quite properly the author has been strongly influenced by Leduc's 1934 Paris thesis and Hippke's report of the transportation of wounded from Poland. Yet he has maintained his equilibrium and takes his stand somewhere between those two and at about the point occupied by the British and ourselves.

The third part of the book deals with the choice of the airplane, its equipment and its pilot. These three chapters are by far the most important in the book, since they contain most of the new material to be found therein. The author is to be

congratulated on the carefully tabulated lists and illustrations, which must have been boring to prepare but which are so necessary to one about to embark on a study of air ambulances and air borne patients

The closing three chapters are devoted to the position and progress of medical aid by air in Argentina

**The Problem of Tumours The Application of Blastogenic Agents to Gillates A Cytoplasmic Hypothesis** By J C Mottram M B, Director, Research Department, Mount Vernon Hospital Northwood Boards Price, 7s 6d Pp 91, with 33 illustrations London H K Lewis & Co, Ltd, 1942

Cancerogenic agents, e g cyclic hydrocarbons, radiations, heat and hypertonic solutions, have no chemical or physical properties in common that can explain their effects on cells. The author set himself the task of studying the response of cells to cancerogenic agents in order to determine, if possible, whether such response represents reactions common to many kinds of cells. The monograph deals with the changes in parametarial cells on exposure to cancerogenic agents. Exposures to such agents gave rise to abnormal cells which the author is inclined to regard as the equivalents of cancer cells. Because the changes from the normal seemed to involve primarily cytoplasm, the author speaks of a cytoplasmic hypothesis of cancerogenic action. It is noteworthy that in his cultures the abnormal cells gave rise to normal as well as to abnormal cells and hence had the power to revert to the normal. So far as is now known, such reversion does not occur in cancer cells. The monograph will interest especially students and investigators of fundamental cytologic problems.

**A Hand-Book of Ocular Therapeutics** By Sanford R Gifford, M A M D, F A C S, Professor of Ophthalmology Northwestern University Medical School, Chicago Third edition Cloth Price \$4 Pp 410, with 69 illustrations Philadelphia Lea & Febiger, 1942

When the ophthalmologic profession accords to a book the wholehearted welcome that greeted the first edition of this work it throws on the author the moral obligation of periodic revision in order that the textual material may be kept abreast of modern advances. Unfortunately, many authors do not recognize this obligation and our reference shelves and libraries are cluttered with antiquated volumes that tend to confuse the earnest searchers for truth. The profession may well rejoice that Gifford is well aware of the faith placed in his writings and continues to justify that faith by the careful preparation of the well thought out and revised third edition. In this some of the earlier material has been deleted and the space filled with careful descriptions of the therapeutic advances of the past four years. But the telling of the therapeutic measures is the minor aspect, the evaluation is the major. Gifford presents a fair estimate of just how good these recent measures are, based on the writing and personal word of expert clinicians and backed by his own extensive experience. That personal touch is what lifts the book out of the ranks of the ordinary.

**Anoxia Its Effect on the Body** By Edward J Van Liere Ph D, M D Cloth Price \$3 Pp 269, with 17 illustrations Chicago University of Chicago Press 1942

This book is one of the first to study the effect of anoxia on the various systems of the body. Its author is to be congratulated not only on his concept but also on his diligence in searching out the literature on the subject. He not only produces much new evidence but indicates many new lines of investigation. It is amazing that so much material could be compressed into so small a volume and yet maintain clarity. Any new departure in treating such a complex subject is certain to show some of the roughness of pioneer work. For instance, the method of presenting references could be improved on, and the index needs more expansion and cross references. Confusion also arises from the fact that many of the authors that he quotes did not fully appreciate the difference between mountain sickness and chronic altitude sickness. Nevertheless the book is a useful one and serves as an excellent introduction to aviation medicine as well as a magnificent reference work for the entire subject of anoxia.

**Obstrucción de la vena central de la retina** Por el Dr Federico Carlos Cerboni Tesis, Universidad nacional de Buenos Aires, Facultad de ciencias médicas Paper Pp 102, with 17 illustrations Buenos Aires 1941

The author, in his graduation thesis for the University of Buenos Aires, reviews the anatomy, histopathology and history of clinical observation covering obstruction of the central vein of the retina and reports his findings in 4 cases. The illustrations are chiefly photographs of fundus conditions. Various theories of pathogenesis are reviewed. While arteriosclerosis seems to be the most common factor, the condition in a certain number of cases is due to syphilis and in others to inflammation in or about the vein resulting from foci of infection in the teeth, tonsils or elsewhere. Of the author's 4 cases, arteriosclerosis with hypertension was present in 3, while, in the other, syphilis was considered probable, the patient being 38 years of age with a positive Kahn reaction. This was the only case in which improvement occurred, vision returning to 2/3 after three months. Secondary glaucoma occurred in 1 of the cases, but surgery was not required, as the eye remained free from pain. The only treatment given in the author's cases was acetylcholin, dietary measures and ethylmorphine hydrochloride, with miotics in the case in which glaucoma developed and antisiphilitic treatment in the case due to syphilis. In his review of therapy, the recent cases treated with heparin are discussed. Complete recovery of vision has occurred in only a few cases, 75 per cent according to Wessely. Glaucoma develops in from 13 to 23 per cent of cases and is especially difficult to control. The tension at the onset is usually below normal in the affected eye, the difference between the two eyes varying from 2 to 9 mm in the author's cases. According to Wessely the prognosis is less favorable in cases with a more marked difference in tension between the two eyes. It is less favorable in patients with higher blood pressure and more favorable in younger patients. The second eye is involved in approximately 6 per cent of cases, and Moore's statistics indicate that 41.6 per cent of affected persons die within six years as a result of cerebral vascular accidents. There is a bibliography.

**Trastornos cardíacos en los estados anémicos Contribución clínica y experimental a su estudio** Por el Dr Eugenio R Pietrafesa Tesis de doctorado, Universidad nacional de Buenos Aires Facultad de ciencias médicas Paper Pp 209 with 127 illustrations Buenos Aires Estudio de Artes Gráficas "Futura", Librería "El Ateneo," 1941

This monograph is based on an analyses of 20 clinical cases and experiments on 17 rabbits. The author's conclusions fall in line with the generally accepted point of view. He describes the clinical, roentgenographic and electrocardiographic alterations in the heart in anemia, and the changes induced in rabbits by hemorrhage as regards both the electrocardiogram and the microscopic appearance of the heart post mortem. He attributes the changes in the heart as primarily due to coronary insufficiency and submits a table subdividing the various varieties of coronary insufficiency to be encountered clinically on a systematic basis and places anemias in their proper location. Throughout this well documented report the author's findings are intelligently integrated with the findings in the literature. References are made to two hundred and seventy-three previous publications in the world's literature. This is a meritorious contribution to the subject in the Spanish language.

**The Jamaica Hospital A History of the institution 1892 1942** Written and Compiled by F G Riley M D, Historian of the Medical Board The Jamaica Hospital, Jamaica Long Island N Y Cloth Price \$1 Pp 172 with 20 illustrations Jamaica 1942

An intimate story of an institution and those who guided it through many years, told in a most interesting way. The story of the Jamaica Hospital "starts in the early eighties, the period of the horse car, the plank roads, toll gates, the high wheeled bicycle and the volunteer fire department. It progresses through the 'Gay Nineties,' the coming of the trolley, the telephone, the graphophone, the safety bicycle and the horse racing on Hillside Avenue on Sundays and holidays, and then into the early 1900's and the coming of the automobile, the fire roads." The printing and binding are exceptionally well done and the reading of the book is as pleasant to the eye as to the mind.

### VITAMIN D AND HEALING OF LESIONS OF PULMONARY TUBERCULOSIS

To the Editor—I should like to know the current opinion with regard to the role of vitamin D in the utilization of calcium during the healing of a tuberculous pulmonary lesion. I am at present a patient in a sanatorium where the diet while otherwise well balanced could not possibly contain more than a very small variable quantity of vitamin D. The calcium intake is adequate mostly in the form of whole milk. The average adult patient does not receive any supplementary form of vitamin D and adult bed patients are not exposed to the sun. If the normal individual who usually gets a certain amount of solar irradiation requires a daily intake of 625 units of vitamin D would it not be reasonable to suppose that a patient with a tuberculous lesion which so often heals by calcification would require at least the average normal adult dosage? As far as I know in the usual sanatorium diet this could be accomplished only by the addition of some supplementary form of vitamin D. Is the administration of fairly large doses of vitamin D to adult bed patients a common practice in sanatoriums or is it regarded as unimportant?

Michael F. Flatley, M.D. Weimar Calif

ANSWER—Although vitamin D has been given empirically for a long time in the form of cod liver oil, there is a dearth of accurate knowledge regarding any specific effect it may have on human tuberculosis.

It would seem that benefits from cod liver oil and like products are due to its food value, vitamin A as well as vitamin D. Knudson and Floody (Fat as a Factor in Healing of Rickets with Vitamin D, *J. Nutrition* 20:317 [Oct.] 1940) showed that 5 per cent fat enhances the effect of vitamin D in healing. Any work done on cod liver oil therefore, cannot be accepted as final proof of a vitamin D effect. Work on pure vitamin D is relatively scarce.

The discussion of the problem therefore will be largely hypothetical, as experiments on tuberculous patients have been too few and the reported results too equivocal to have any practical significance. Spies and Glover (Renal Lesions with Retention of Nitrogenous Products Produced by Massive Doses of Irradiated Ergosterol, *Am. J. Path.* 6:485 [July] 1930) and Crimm, Strayer, Watson and Heimann (The Effect of Viosterol on the Absorption and Retention of Calcium, *Am. Rev. Tuberc.* 28:202 [Aug.] 1933) reported that vitamin D caused tubercles to calcify better in human tuberculosis. McClung and Glickman (Vitamin D Milk in Pulmonary Tuberculosis, *Bull. U. S. Vet. Admin.*, 1934, p. 26) reported greater improvement in tuberculous patients receiving vitamin D than in a control group. On the other hand Grayzel, Shear and Kramer (Vitamin D in Bone Tuberculosis in Children, *Am. Rev. Tuberc.* 24:106 [Aug.] 1931) found no advantage if the diet was balanced.

In animal experiments, little or no favorable results have been reported. Trevorrow, DeSavitsch, Black and Lewis (Effects of Prolonged Viosterol Administration and of Artificial Sunlight Radiation on Experimental Tuberculosis in Rabbits, *Proc. Soc. Exper. Biol. & Med.* 31:802 [April] 1934), Steenken and Baldwin (Effect of Irradiated Milk Compared with Vitamin D Oils on Inhalation Tuberculosis of Guinea Pigs, *Am. Rev. Tuberc.* 35:656 [May] 1937) and Steiner, Greene and Kramer (Effects of Vitamin D Deficiency on Experimental Tuberculosis in Rabbits, *ibid.* 35:640 [May] 1937) found no favorable effect in animal tuberculosis. Grant, Suysnaga and Stegeman (Effect of Rachitic Diets on Experimental Tuberculosis in White Rats, *ibid.* 16:628 [Nov.] 1927) showed a definite value of vitamin D, but not without balancing up other vitamins and minerals. A certain balance with vitamins A and C and calcium and phosphorus seemed to result in prolongation of the lives of guinea pigs.

All we are justified in concluding is that vitamin D does not affect the tuberculous lesion itself directly but perhaps produces favorable results in its role as a mobilizer of the serum calcium, which in turn tends to prevent a progression of the disease. In the presence of adequate calcium and phosphorus (and perhaps parathyroid hormone) vitamin D seems to allow a better absorption of calcium from the intestine. A deficiency of any of the three will affect the metabolism of the others. Likewise an excess of any one of the three with a deficiency of any of the others will have an equally unfavorable effect. High vitamin D for instance in the presence of low calcium and phosphorus actually robs the bones of calcium to keep the serum level up.

Vitamin D, calcium and phosphorus levels must therefore be maintained, as otherwise there will be a depletion of calcium, which is necessary for general metabolism even if it has no specific effect on the tuberculous process.

The problem of calcification itself in tubercles usually comes only after the battle has been won and the fibrous capsule produced. The important requirement in tubercle encapsulation (formation of collagen in connective tissue) is perhaps more dependent on vitamin C than on vitamin D.

The unfavorable effect of vitamin D deficiency seems, therefore, to be a late indirect effect more than anything specific. Any ill results probably come only after there is an imbalance of other vitamins and minerals resulting in a decrease of the calcium absorption and lowering of calcium in the blood. This would tend to increase cell permeability (Petersen, W. F., and Levinson S. A. Skin Reactions Blood Chemistry and Physical Status of "Normal" Men and of Clinical Patients. VII Study of Eighty-Three Tuberculous Patients, *Arch. Path.* 9:295 [Jan.] 1930) and enhance the development of allergy, exudation and progressive disease (Goldberg, Benjamin Medical, Symptomatic and Tuberculin Therapy. Specific Therapy, in his Clinical Tuberculosis Philadelphia, F. A. Davis Company 1 C-75, 1939). The later effects (calcification ossification and so on) probably take place after the crucial struggle has been ended.

The conclusions therefore are that vitamin D is an important link in the chain of favorable metabolic adjuvants and not only should be kept up to a standard level but also should be balanced with other important vitamins (vitamins A, B, C) and minerals, especially calcium and phosphorus in the form of bone meal or similar products, to avoid a deterioration in the defensive mechanism against any infection, including tuberculosis. The evidence at hand, however, fails to support an active specific effect on tubercles or the disease tuberculosis.

The last question may be answered "yes," but vitamin D is too often given in "shotgun dosage" of cod liver oil or in capsules rather than being made a problem of scientific dietetics.

### PROBABLE KIDNEY STONE

To the Editor—A white man aged 37 complains of attacks of severe pain over the left loin headaches backache and nervousness. Since the acute onset January 14 he has had three attacks with pains radiating to the left testis and frequency of urination. A penile blister was noted twenty years ago but no dork field examination was done. The lesion was cauterized and no further treatment given. He has had repeated negative blood Wassermann reactions. Examination revealed a sluggish facies pulse rate 80 temperature 98.6 F blood pressure 126 systolic and 70 diastolic head normal. The right pupil is slightly larger than the left and shows but little reaction to light though it reacts to accommodation. The ears nose and throat are normal. The heart apparently is not enlarged and the sounds are normal. The chest is clear. The kidneys were not palpable and the pain diffused over the left side is not localized. There is an atrophied left testis (said to be due to mumps) but no evidence of a penile scar. There is a small herniation through the left inguinal ring. The extremities are normal. The knee jerks are active. There is post pointing on the finger to nose test and a slight swaying on the Romberg test. Urinalysis gave negative reactions for albumin and sugar but 5 to 6 blood cells and 3 to 4 pus cells per high power field. The prostate was adenomatous and normal in size. The seminal vesicles were palpable and tender bilaterally. On cystoscopic examination slight edema and congestion were seen near the left ureteral orifice but a number 5 catheter passed to each kidney with ease. Indigo carmine appeared from the left kidney in four minutes and blue in six and from the right in four minutes and blue in seven. A specimen from the right kidney was loaded with blood cells and 2 to 3 pus cells per high power field. Urine from the left kidney was loaded with blood cells and one pus cell per high power field. A roentgenogram with catheters in situ revealed no evidence of stone. Skiodan pyelograms (retrograde) revealed kidneys normal in size position and outline. There is a tendency to a bifid pelvis on each side and some blunting of the calices of both kidneys. A diagnosis of chronic pyelonephritis and seminal vesiculitis was made. The blood Wassermann reaction was reported negative. A spinal puncture revealed white clear colorless fluid under normal pressure with three cells (two lymphocytes) complement fixation negative mastic test 21100. Because of a rather severe postpuncture headache I doubt if permission would be given for a repeat. Would you consider this man's symptoms and findings partly attributable to a latent spinal syphilis and if so would you advise treatment?

M. D. South Carolina

ANSWER—From the history, one would be inclined to make a diagnosis of renal colic due to stone. This patient has had several attacks of severe pain over the left loin with pain radiating to the testis frequency of urination and other classic symptoms of renal calculus. The roentgen examination is negative for stone. However, it is possible that the patient passed the stone before the exposure was made and hence the stone cannot be demonstrated. It may also be possible that the stone is of such density that it cannot be demonstrated with the roentgen ray. It is also possible that the stone rests over a bone and hence cannot be demonstrated. The history is so classic that one would be justified in diagnosing stone from the history alone. Furthermore cystoscopy revealed edema and congestion

near the left ureteral orifice. This is further evidence of disease in the left kidney. One not infrequently sees these cystoscopic findings after the patient has had a stone or when the stone is in the intramural part of the ureter. The fact that the catheters passed without difficulty or obstruction does not exclude the possibility of stone.

The patient's prostate and vesicles were tender and the fluid could not be examined. Because of tenderness the patient's prostate and vesicles should be massaged at weekly intervals for three weeks and the fluid examined under the microscope for evidence of vesiculitis, namely, pus in the microscopic preparation. Once in a while a patient with seminal vesiculitis has symptoms compatible with renal colic. Seminal vesiculitis is much more infrequently the cause of renal colic than is calculus. Probability is the rule of life, this patient probably has a renal calculus or has passed one. Large amounts of urinary crystals in the urine may produce just this picture. There is enough evidence here to justify a diagnosis of syphilis of the central nervous system, and there would not be much sense in again doing a lumbar puncture.

### SKIN BURN AND RHEUMATOID ARTHRITIS

*To the Editor*—A white man aged 61 was burned on his face the upper part of the chest and both hands and arms with strong sodium hydroxide solution. Three weeks after the accident he began to suffer from generalized rheumatoid arthritis, more especially in the shoulders, the fingers and the joints of the lower extremities. For the past five years he had mild diabetes mellitus. Never before had he had arthritis. Can sodium hydroxide burns of the skin cause rheumatoid arthritis?

Samuel H. Justa, M.D., Rocky Mount, N.C.

*ANSWER*—Since the specific cause of rheumatoid arthritis is not known, this question cannot be answered definitely. There seem to be a number of precipitating causes for rheumatoid arthritis. These include acute infections of the respiratory tract, changes incident to the postpartum period, acute chilling, shock and worry. By producing shock and worry, burns of the skin by sodium hydroxide might perhaps serve as a predisposing cause in a person "about ready" to have rheumatoid arthritis, but if so the occurrence is indeed rare and unusual. As far as is known, rheumatoid arthritis is not a recognized complication of any other type of cutaneous burn, even when the burn is extensive.

### LEAD POISONING FROM DENTAL BRACES

*To the Editor*—What is the possibility of the development in a youth aged 19 of lead poisoning from braces fitted by a dentist? The braces are alleged to have had a lead content of unknown quantity. Has any case of poisoning of this type ever been reported? A professor of biochemistry has found lead chloride in the youth's urine. Would you please state what percentage of lead found in urine would be considered pathologic?

M.D., Georgia

*ANSWER*—Lead poisoning from dental braces has not been reported as far as is known, and braces would be a most unlikely source of the disease. It would be particularly unwise to ascribe any lead absorption to such braces without knowing whether they contained a high concentration of lead. The concentration of lead in the urine which may imply pathologic changes in some cases is considered to be above 0.15 mg. per liter of urine.

### IRON THERAPY FOR CHILDREN

*To the Editor*—What iron preparation can be used in the treatment of secondary anemia in a 3 year old child? Liquid forms of any kind are not possible because of the taste. Capsules and coated tablets do not seem to be practical. A small ferrous sulfate tablet probably could be used, but I do not know of any such tablet. What is the usual method of iron administration at this age? Liquid forms are principally elixirs, which seem to have too high a percentage of alcohol for the amount of iron necessary.

Stanton S. Eddy, Jr., M.D., Middlebury, Vt.

*ANSWER*—Iron is conveniently given to children in the form of a solution of ferric ammonium citrate in water. The usual strength of this solution is from 10 to 50 per cent. The amount given is regulated by the strength of the solution and the weight of the child. For example, in a 10 per cent solution the amount given in twenty-four hours is 2 cc. per kilogram of body weight (1 cc. a pound). This may be divided into three portions and conveniently given at meal time in milk. Rarely will a child ever object to the taste. It is just as well to direct the mother to have the child take a drink of water following the iron, and not to continue the treatment longer than a month at a time. This does away with any discussion about staining the teeth.

### ESTIMATION OF THE SIZE OF A CUTANEOUS BURN AS RELATED TO THE SURFACE OF THE BODY

*To the Editor*—At a recent meeting of the staff of the hospital with which I am affiliated the problem of accurately determining the percentage of the surface of the body that has been involved in a burn was discussed. Some of the men believe that there is some form of table which will show approximately what portion of the body surface is in the arm, hand, thigh, fingers and so on. Each feels that the figures covering the involved portions are too high when the estimates are made by gross visual evaluation. Our group would appreciate any information you have on this subject.

J. M. Feder, M.D., Anderson, S.C.

*ANSWER*—The table adopted by the great majority treating burns for determining the approximate portion of the body surface involved has been one outlined by Dr. S. G. Berkow. Dr. Berkow is listed as residing in Perth Amboy, N.J. A reference which should prove valuable is

Berkow, S. G. Value of Surface Area Proportions in the Prognosis of Cutaneous Burns and Scalds. *Am. J. Surg.* 11: 315 (Feb.) 1931.

### EPILEPSY AND SELECTIVE SERVICE REGULATIONS

*To the Editor*—I should like to know whether army life would be detrimental to a man of 30 who has had epileptic seizures since the age of 7, when he received a blow on the head. He gets these seizures but once in four or five years.

M.D., New Jersey

*ANSWER*—Whether army life will be detrimental or not is a purely academic question. The fact is that the Selective Service regulations place individuals with epilepsy in class 4. Even if the fits occur only once every four or five years, such a classification should be made if it is established that the attacks are of epileptic type and that a severe head injury has been sustained.

### INFECTED TONSILS AND DIABETES

*To the Editor*—A girl aged 11 was first seen by me on Aug. 31, 1940 for infected tonsils and overweight. She wanted to have them removed. The urine at that time was normal. She then had a cold and I saw her again in April 1941. The urine at that time showed 4 plus sugar, it was not tested for acetone or diacetic acid. She was placed on a diet, which decreased the glycosuria somewhat but she still has 3 plus sugar in the urine. Blood sugar varies from 250 to 400 mg. per hundred cubic centimeters. Her weight has decreased from 128 pounds (58 Kg.) to 117 pounds (53 Kg.). I should like to know if it would be advisable to remove the infected tonsils at this time and by so doing expect an improvement in her diabetic condition.

M.D., Minnesota

*ANSWER*—If the patient is under good diabetic control, free from acidosis or dehydration, there would be no contraindication to tonsillectomy. Infected tonsils may impose an added metabolic stress and decreased tolerance, so that tonsillectomy may be expected to improve her diabetic condition. It would be advisable to wait at least two weeks after the active infection subsides before removing the tonsils. During this time the glycosuria, hyperglycemia and ketonuria, if present, can be properly controlled. If the diabetes is uncomplicated by acidosis, a diet which meets the physiologic needs of the patient should be prescribed. The amount of insulin should then be determined which will keep the blood sugar within a relatively normal range and minimize the glycosuria. A temporary preoperative and postoperative routine to meet the special conditions imposed by the tonsillectomy should be started the night before the operation. The previous regimen can usually be resumed twenty-four hours after the operation.

### METHODS OF VACCINATION AGAINST DIPHTHERIA AND SMALLPOX

*To the Editor*—I would like to have you answer the following questions if possible. Is it advisable in view of the fact that only two injections are required, to use alum precipitate diphtheria toxoid in high school instead of the regular toxoid? Is the possibility of severe local reactions enough to counterbalance the time saved in a busy health department? Please discuss the treatment of sterile abscesses after using alum precipitate toxoid. Is the practice of giving smallpox vaccinations in the thigh much more dangerous than that of using the upper arm?

M.D., Oregon

*ANSWER*—In view of the frequency with which severe local reactions occur following the use of two injections of alum precipitate diphtheria toxoid in older children, it would hardly seem advisable to use this method in high school students. For children under 10 years of age, two doses of alum precipitate toxoid, given two to four weeks apart, produced the higher level of diphtheria antitoxin in the blood. In high school students it would appear better to employ two or three doses of plain diphtheria toxoid.

The treatment of sterile abscesses produced by alum precipitate toxoid usually consists in the application of hot dressings, incision and draining.

Clinical experience seems to indicate that giving smallpox vaccinations in the thigh is attended by more frequent minor and more severe reactions than when the upper arm is used.

## SURVEY OF INFLUENZAL MENINGITIS OVER A TEN YEAR PERIOD (1931-1941)

EVELYNNE G. KNOUF, MD  
LOS ANGELES

WILLIAM J. MITCHELL, MD  
ALHAMBRA, CALIF  
AND

PAUL M. HAMILTON, MD  
SAN MARINO, CALIF

A survey of cases of influenzal meningitis seen and treated in the contagious disease department of the Los Angeles County Hospital over a ten year period (July 1, 1931 to July 1, 1941) reveals some interesting data.

The series of cases reported represents a total of 63 patients. Of these 47 were under 6 years of age and 16 were over 6. There were 36 males and 27 females. The gross mortality for the series was 84 per cent.

The patients have been divided into four groups: group 1, who received only symptomatic treatment; group 2, who were treated with serum; group 3, who were given sulfanilamide; and group 4, who received sulfapyridine. Each group will be considered separately.

### GROUP 1 PATIENTS TREATED SYMPTOMATICALLY

In group 1 there were 19 patients, of whom 15 were under the age of 6 years. The remaining 4 were adults (ages, 33 to 73). Eleven were males and 8 females. Five were in the hospital less than twenty-four hours, the longest hospital stay being six weeks and the shortest three hours. The average for the group was six and six-tenths days.

Symptomatic treatment consisted of parenteral administration of fluids, transfusions and use of sedatives and anupretics.

All the patients in this group died.

### GROUP 2 SERUM TREATED PATIENTS

There were 19 patients in this group also, of whom 12 were males and 7 females. There were 12 under 6 years of age and 7 adults (ages, 7 to 76). Five were in the hospital less than twenty-four hours, the shortest stay being two hours and the longest seventeen days. The average hospital stay was seven and four-tenths days.

Anti-influenzal serum<sup>1</sup> was administered to every patient in the group. It was given intramuscularly

intravenously and intraspinally. By the last mentioned route the average amount used varied from 15 to 25 cc given once or twice daily. Intravenously, 100 to 200 cc of serum in 200 to 300 cc of isotonic solution of sodium chloride was given every eight hours.

All the patients in this group, as in the previous one, died.

### GROUP 3 SULFANILAMIDE TREATED PATIENTS

In this group all 13 patients received sulfanilamide orally and subcutaneously, together with Fothergill's serum intravenously, intraspinally and intramuscularly.

Nine were less than 6 years of age, and 4 were over this age. There were 6 males and 7 females. The shortest hospital stay was two days and the longest sixty days, with an average of fifteen and one-half days.

Only one patient survived. The history of the patient who survived is reviewed.

H. R., a white girl aged 6 years, was admitted on Dec. 16, 1938 with a history of insomnia, restlessness, anorexia and fever for two days and stiff neck and convulsions for twenty-four hours.

Physical examination revealed that the child was poorly nourished and developed, delirious and acutely ill, with a temperature of 104 F, a pulse rate of 148 and a respiratory rate of 36. There was boardlike rigidity of the neck. Brudzinksi's and Kernig's signs were present and Babinski's bilaterally.

The initial and subsequent laboratory data are summarized in table 1.

Treatment consisted in the administration of massive doses of sulfanilamide and anti-influenzal serum. In a ten day period from December 16 to 27 the patient received a total of 9,350 cc of 1 per cent sulfanilamide solution or 1402½ grains. The concentrations in the blood ranged from 2 to 13 mg per hundred cubic centimeters and that in the spinal fluid from 7 to 15 mg. The drug was discontinued because of the appearance of jaundice and severe anemia. Anti-influenzal serum 100 cc was given intravenously on admission and then every eight hours until a total of 791 cc had been given. On December 20 intrathecal administration of the serum was started in doses of 15 cc with 5 cc of complement and it was carried out daily up to and including December 31. On December 23, seven days after admission, the spinal fluid culture was negative and it remained so.

The patient was discharged on Feb. 17, 1939 as cured and was seen in the outpatient department in January 1941. At this time there were no complaints. The child was attending school and was doing well.

### GROUP 4 SULFAPYRIDINE TREATED PATIENTS

There were 12 children in this group. Of this number 7 were boys and 5 girls. The oldest was 8 years and the youngest 3 months, and both of them survived. The patients who lived numbered 9. 5 were 2 years or less, 1 was 3 years, 2 were 4 years and 1 was 8 years old. There were 3 deaths; the patients were 20 months, 2 years and 3 years of age respectively. It becomes

<sup>1</sup> From the contagious disease unit of the Los Angeles County Hospital and the University of Southern California School of Medicine.  
<sup>2</sup> Obtained from the Laboratories of the Commonwealth of Massachusetts and commonly referred to as Fothergill's serum.

RECEIVED BY THE  
JUNE 27 1942

obvious that the mortality for this group is astonishingly low

The shortest hospital stay was eight days and the longest eighty-one days, making an average of fifty-one days, or seven weeks, in round figures

All the patients in this group except 1 received serum in addition to sulfapyridine

The cases in this group are briefly summarized

CASE 1—L P, a white girl aged 18 months, entered the hospital on April 7, 1939 with a history of fever, vomiting and stiff neck for twenty-four hours. The examination revealed that the child was irritable and acutely ill, with a temperature of 103 F, a pulse rate of 110 and a respiratory rate of 28. The neck and the spine were rigid. Kernig's and Brudzinski's signs were elicited.

The blood count showed 68 per cent hemoglobin, 3,500,000 red cells and 15,000 white cells, with 68 per cent lymphocytes

Cultures of spinal fluid taken daily for fourteen days were all positive for *H influenzae*.

The patient was given 1 Gm of sulfapyridine every four hours orally until July 16, when 1275 Gm of the drug had been administered. The concentration in the blood varied between 5 and 13 mg per hundred cubic centimeters. The child was discharged on August 11 as well.

CASE 3—J S, a white girl aged 2½ years, entered the hospital on May 20, 1939 with a history of chills, fever, vomiting and stiff neck for three days. Examination revealed her to be acutely ill, with a temperature of 103.6 F, a pulse rate of 138 and respiratory rate of 26. There was marked rigidity of the neck and the back, and Kernig's and Brudzinski's signs could be elicited.

The blood count revealed 65 per cent hemoglobin, 3,900,000 red cells and 14,500 white cells, with 91 per cent polymorphonuclear leukocytes. Examination of the spinal fluid showed a pressure of 240 mm, with 1,180 polymorphonuclear cells

TABLE 1—Laboratory Data for H R

Spinal puncture revealed a pressure of 400 mm, a reaction for globulin of 2+ and 810 polymorphonuclear cells. Both spinal fluid and blood cultures were positive for *Hemophilus influenzae*.

The patient was given sulfapyridine orally, 1 Gm every four hours, and the drug was discontinued on the fourteenth day. A total of 84 Gm had been administered. In addition, 40 cc of anti-influenzal serum was given intravenously every twelve hours. However, this treatment was discontinued on the fourth day because of a severe serum reaction. Blood and spinal fluid cultures were negative on the third day after admission, and the child steadily improved. She was discharged on the thirty-eighth day (May 5) with no residual complaints, and recent follow-up has revealed her to be in perfect health.

CASE 2—C H, A white girl aged 2 years, was admitted on June 19, 1939 with a history of anorexia, vomiting, a temperature of 103 F and a stiff neck for two days. On entry the temperature was 102.6 F, the pulse rate 126 and the respiratory rate 36. The child was semicomatose. There was boardlike rigidity of the neck and the spine. Kernig's sign was elicited.

Examination of the spinal fluid showed a pressure of 300 mm and cells numbering 76,000, all of which were polymorphonuclear. A blood count revealed 74 per cent hemoglobin and 14,550 white cells, with 86 per cent polymorphonuclear leuko-

cytes. *H influenzae* was found on culture of the initial spinal fluid taken. The cultures remained positive until death.

The patient received both sulfanilamide (10 grains [0.6 Gm] every four hours) and sulfapyridine. By the time she died she had received 50 Gm of sulfanilamide and 587 Gm of sulfapyridine in addition to 190 cc of anti-influenzal serum. The concentration in the blood varied from 4.5 to 16 mg per hundred cubic centimeters. At times the patient seemed to improve. The temperature ranged from 98.6 to 104 F and the spinal fluid cell count from 1,180 to 40. Several transfusions were performed. In spite of heroic treatment, the patient died on August 3. Autopsy revealed thick, purulent material at the base of the brain, considerable softening of the brain tissue and definite enlargement of the ventricles.

CASE 4—R J, a Negro boy aged 3 years, entered the hospital on July 6, 1939 with a history of vomiting, fever and stiff neck for four days. He was extremely restless, irritable and had a temperature of 99.4 F, a pulse rate of 110 and a respiratory rate of 24. The throat was inflamed. After being injected, the neck and spine were stiff and Kernig's and Brudzinski's signs could be elicited.

A blood count revealed 60 per cent hemoglobin, 3,600,000 red cells and 16,000 white cells, with 88 per cent polymorphonuclear leukocytes. Examination of spinal fluid showed a pressure of 240 mm, with 1,180 polymorphonuclear cells.

pressure of 250, with 2,200 polymorphonuclear cells. Both spinal fluid cultures and blood cultures were positive for *H. influenzae*.

The administration of sulfapyridine was started with 2 Gm, and then 1 Gm was given every four hours, with a total dose of 40 Gm in an eight day period. The spinal fluid culture became negative on July 12, and improvement was steady. The patient was discharged on August 11.

CASE 5—J. McG., a white boy aged 4 years entered the hospital on Feb 25, 1940 with a history of fever, vomiting and stiff neck for one day. Examination revealed that he was acutely ill and prostrated by continuous vomiting. The temperature was 103.2 F, the pulse rate 132 and the respiratory rate 36. The neck was stiff and Brudzinski's and Kernig's signs were elicited.

The blood count revealed 80 per cent hemoglobin, 5,190,000 red cells and 34,800 white cells with 86 per cent polymorphonuclear leukocytes. Examination of the spinal fluid showed a pressure of 135 mm, a reaction for globulin of 4 plus and 2,000 polymorphonuclear cells. *H. influenzae* was found on smear and on culture of the spinal fluid as well as of the blood.

The patient was given 1 Gm of sulfapyridine every four hours and 20 cc of 5 per cent sodium sulfapyridine solution intravenously on two occasions eight hours apart. He showed much improvement in three days and on March 2 was afebrile. Administration of the drug was continued until March 10 or for ten days after the spinal fluid cultures became negative. The total amount given was 113.5 Gm. In addition the patient received 210 cc of anti-influenzal serum intravenously. He was discharged on March 25.

CASE 6—R. B., a white boy aged 20 months was admitted on Nov 1, 1939 with a history of fever, lethargy for twelve days and coma for twenty-four hours. He was extremely toxic and comatose, rousing only to painful stimuli. The throat was severely injected and the left tympanic membrane red and bulging. The neck was rigid. There was paralysis of the right arm and leg.

A blood count revealed 88 per cent hemoglobin, 4,300,000 red cells and 16,000 white cells, with 61 per cent polymorphonuclear leukocytes. Examination of the spinal fluid showed a pressure of 350 mm, 74 cells (all lymphocytes) and a 3+ reaction for globulin. Spinal fluid cultures were positive for *H. influenzae* and continued so until death.

Sulfapyridine was given orally, the total dose being 25 Gm, 60 cc. of anti-influenzal serum was given intravenously. The patient showed no improvement. The spinal fluid cell count varied between 64 and 240 the presence of lymphocytes pointing to chronic meningitis. There was also evidence of hydrocephalus. The patient died on November 4.

CASE 7—E. M., a Mexican boy aged 3 years, entered the hospital on March 14, 1941 with a history of cough, fever, lethargy and vomiting for eight weeks and headache for two weeks. Examination revealed that he was well nourished and well developed, acutely ill and extremely irritable, with a temperature of 103.6 F, a pulse rate of 124 and a respiratory rate of 38. There was moderate rigidity of the neck, and Kernig's and Brudzinski's signs could be elicited.

A blood count revealed 68 per cent hemoglobin, 3,700,000 red cells and 13,050 white cells, with 76 per cent polymorphonuclear leukocytes. Examination of the spinal fluid showed a pressure of 130 mm and 1,782 cells, with 68 per cent polymorphonuclear leukocytes. The spinal fluid was positive for *H. influenzae* on smear and culture. A blood culture was negative.

The patient was treated intensively, first with sulfanilamide (the total received in twelve hours was 45 grains [3 Gm]) and then with sulfapyridine (268 Gm in a thirty-eight day period). The concentration in the blood varied from 8 to 144 mg per hundred cubic centimeters. In addition, 200 cc of anti-influenzal serum was given intravenously. Death occurred on April 4.

CASE 8—C. W., a white girl aged 8 years, entered the hospital on Aug 31, 1940 with a history of vomiting and headache for one day and coma for eight hours. Examination revealed that she was comatose and acutely ill with a tem-

perature of 104 F, a pulse rate of 144 and a respiratory rate of 36. There was boardlike rigidity of the neck, and Kernig's and Brudzinski's signs were elicited.

A blood count revealed 90 per cent hemoglobin, 4,550,000 red cells and 13,750 white cells, with 66 per cent polymorphonuclear leukocytes. The spinal fluid pressure was 350 mm, the reaction for globulin was 3+ and there were 9,856 cells, with 96 per cent polymorphonuclear leukocytes. Blood and spinal fluid cultures were positive for *H. influenzae*.

The patient was given a 1 per cent solution of sulfanilamide, 200 cc subcutaneously every eight hours, after a report on the culture was received and 800 cc had been given, the treatment was changed to continuous drip administration of 0.5 per cent sodium sulfapyridine solution, a total of 3,500 cc, or 35 Gm, being given. The drug was then given orally, 1 Gm every four hours, until a total of 163 Gm had been administered. In addition, 180 cc of anti-influenzal serum was given intravenously. The patient had a relapse during therapy, and so on October 21 administration of sulfathiazole, 1 Gm every four hours, was begun. This treatment was continued until October 18 when a total of 91 Gm had been given. The last spinal fluid culture, material for which was obtained on September 29, was negative. The patient was discharged on October 23.

CASE 9—G. S., a Mexican boy aged 1½ years, entered the hospital on Sept 9, 1940 with a history of cough and vomiting for one week and fever and stiff neck for three days. Examination revealed that he was acutely ill, restless and irritable, with a temperature of 102.6 F, a pulse rate of 144 and a respiratory rate of 44. There was evidence of pneumonitis of the lower lobe of the left lung the neck was rigid and Brudzinski's and Kernig's signs could be elicited.

A blood count revealed 92 per cent hemoglobin, 5,300,000 red cells and 39,600 white cells, with 67 per cent polymorphonuclear leukocytes. Examination of the spinal fluid showed a pressure of 240 mm, with 208 lymphocytes. Blood and spinal fluid cultures were positive for *H. influenzae*.

The child was treated with emulsion of sulfapyridine, 5 grains (0.3 Gm) every four hours given orally and a 0.5 per cent solution given intravenously. A total of 40 Gm was given over a ten day period. Also 125 cc of anti-influenzal serum was given intravenously. The concentration in the blood varied between 6 and 175 mg per hundred cubic centimeters. The cultures remained positive until October 20, medication was continued for five days afterward. The patient was discharged on November 27.

CASE 10—R. M., a Mexican boy aged 3 months, entered the hospital on Oct 21, 1940 with a history of irritability and fever for one week. Examination revealed that he was acutely ill, holding his head in the opisthotonic position. The fontanel was bulging, the neck and the spine were stiff and Kernig's and Brudzinski's signs could be elicited.

A blood count revealed 55 per cent hemoglobin, 3,420,000 red cells and 16,150 white cells, with 74 per cent polymorphonuclear leukocytes. On examination of the spinal fluid it showed a pressure of 225 mm with 2,160 polymorphonuclear leukocytes. A smear and a culture of the spinal fluid were positive for *H. influenzae*, as was a culture of the blood.

Intravenous administration of 1 per cent sulfapyridine solution was started immediately, 25 cc being given every four hours day and night for three days, and then emulsion of sulfapyridine was given. Administration of the drug was continued until November 11 when a total of 56 Gm had been given. In addition, 150 cc of anti-influenzal serum was given intravenously. The concentration in the blood varied from 2 to 85 mg per hundred cubic centimeters. The patient was discharged on November 29.

CASE 11—R. U., a Mexican girl aged 2 years, entered the hospital on Feb 1, 1941 with a history of chills, fever and vomiting for five days. Examination revealed her to be extremely irritable and acutely ill, with a temperature of 103 F, a pulse rate of 116 and a respiratory rate of 24. Both tympanic membranes were bulging and there were pneumonitis of the left lung and boardlike rigidity of the neck and back.

A blood count revealed 90 per cent hemoglobin, 4,950,000 red cells and 18,800 white cells. The spinal fluid pressure was 400 mm, and there were 1,400 cells, of which 80 per cent were

polymorphonuclear leukocytes. A spinal fluid culture was positive for *H. influenzae*.

Intravenous drip administration of 0.5 per cent sodium sulfapyridine solution was started, and in three days the patient had received 5,000 cc, or 50 Gm, of the solution. She was then given sulfapyridine orally until she had received 151.5 Gm more. The concentration in the spinal fluid varied from 8.5 to 50 mg per hundred cubic centimeters. Spinal fluid cultures remained positive until March 10, after which use of the drug was continued for five days. The patient was discharged as well on April 22.

CASE 12—M. G., a white boy aged 4 years, was admitted to the hospital on April 21, 1941 with a history of fever, vomiting and stupor for three days. Examination revealed him to be comatose, acutely ill and moderately dehydrated, with a temperature of 104 F, a pulse rate of 150 and a respiratory rate of 44. There was pneumonitis of the base of the right lung, the neck was rigid and Kernig's sign was present and Brudzinski's absent. Examination of the spinal fluid showed a pressure of 400 mm and the presence of polymorphonuclear leukocytes. A spinal fluid culture was positive for *H. influenzae*.

The patient was given sodium sulfapyridine intravenously, 50 cc of 5 per cent solution, followed by continuous drip administration of a 0.5 per cent solution. This was continued for four days. The drug was then given by mouth until May 7, 1941. The concentration in the blood varied from 2 to 6 mg per hundred cubic centimeters. The spinal fluid culture became negative on April 27 and remained so thereafter. The patient was discharged on May 19.

#### COMMENT

A 100 per cent mortality for any disease is always most discouraging. However, with the dawn of the era of chemotherapy a ray of hope shines forth on the gloomy therapeutic horizon. With the advent of sulfanilamide the results obtained with influenzal meningitis were nothing to comment about. With the introduction of sulfapyridine, and with a certain amount of knowledge gained in the field of chemotherapy through experience with sulfanilamide, good results were obtained. When it is noted that the oldest patient in the last group of 12 was 8 years of age, or that 7 of the 12 patients in this group and 5 of the 9 survivors were 2 years or less, the contribution becomes much more significant. Thus, the fourth group rightfully commands interest and attention.

We have now more or less established a routine in the Los Angeles County Hospital with regard to treatment of influenzal meningitis. Immediately after diagnosis (this is usually a matter of a few hours only), continuous drip administration of sodium sulfapyridine (0.5 or 1 per cent solution in isotonic solution of sodium chloride) is begun, regardless of whether the patient is willing or able to take the drug orally. The purpose is to obtain as high a concentration as possible in the blood and the spinal fluid within twenty-four to forty-eight hours. We feel that the time element is important. We strive for a concentration of at least 10 to 12 mg per hundred cubic centimeters and do not complain if it reaches the high level of 20, 30 or 40 mg. It may be seen that in 1 instance the concentration in the blood and in the spinal fluid reached 50 mg with no ill effects. It is usually not necessary to maintain the drip of sulfapyridine for longer than seventy-two hours. The dose of the drug is calculated in the early stages on the basis of 2 to 3 grains (0.13 to 0.2 Gm) per pound (450 Gm) of body weight in twenty-four hours, with from one half to two thirds of the first twenty-four hour dose being given in the short space of three to four hours. The concentration in the blood and in the spinal fluid are determined

daily. The dose is regulated accordingly. Administration of the drug is continued for two weeks after the spinal fluid becomes sterile and the temperature drops to normal, because of the tendency to relapse. Toward the end of this period the dose is gradually tapered off. During the period of therapy special attention is paid to the maintenance of good general nutrition. Dextrose intravenously, blood by transfusion and vitamins are given as needed. A blood count and a urinalysis are performed at least every two days and oftener if indicated. We endeavor to maintain an alkaline  $p_H$  of the urine. Occasionally use of the drug must be discontinued because of some unfavorable reaction. It is interesting to note that in group 4 (12 patients) it did not become necessary to do this in spite of the heroic measures taken. Because our experience has given us a thoroughly wholesome respect for the sulfonamide drugs, we are ever on the alert for any untoward reaction.

It should be mentioned again that 11 of the 12 patients in group 4 received Fothergill's anti-influenzal serum, however, in view of the fact that 32 patients previously had received the serum, with a mortality of 100 per cent, we feel no credit is due it with regard to the 25 per cent mortality in group 4. We should mention too that none of the patients of group 4 received any therapy intraspinally.

It is of interest that the average hospital stay per patient for groups 1 and 2 was six and six-tenths and seven and four-tenths days, respectively. However, with the advent of chemotherapy and the use of sulfanilamide, in spite of the high mortality the life of the patients had been prolonged by at least a week, the average being fifteen and one-half days. With the use of sulfapyridine the average hospital stay per patient increased to fifty-one days. It is our experience that a patient who survives remains in the hospital at least thirty days and usually two to three months.

With regard to spinal punctures, we do not hesitate in the least to do them daily. As a rule a patient with meningitis has a spinal puncture every one to two days until the temperature drops to normal and the spinal fluid shows signs of clearing. During the two week period when the patient is afebrile and is still receiving the drug a puncture is done every three or four days. The procedure during this period, we feel, is invaluable, as it is not always possible to evaluate the patient's progress accurately by the clinical appearance alone. On many occasions we have done a spinal puncture on a patient who was afebrile and uncomplicating and had no meningeal signs only to find a change in the fluid. Thus we were able to predict a relapse and start treatment again as much as three to four days before the patient became febrile or showed any clinical manifestations of such an occurrence. The spinal fluid in such a case will show a growth on culture, an increase in globulin and an increase in the number of cells or a change in the type of cells from lymphocytes to polymorphonuclear leukocytes. Our patients remain in the hospital fourteen days after chemotherapy has been discontinued. Three or four spinal punctures are done during this period. Hence, every patient who survives will have had a minimum of ten and an average of fifteen to twenty. The record for number held by a 2 year old girl who was in the hospital seventy-five days and had sixty-nine taps. From our experience with all types of meningitis through 17 years, we are certain that we have never done a spinal puncture on any patient any harm by a carefully performed spinal

What the future holds for influenzal meningitis with new sulfonamide drugs coming to the fore no one can predict. We can only hope that a future follow-up study will present results as gratifying as those reported here.

## SUMMARY

Sixty-three patients with influenzal meningitis were seen and treated over a ten year period (July 1, 1931 to July 1, 1941) in the contagious disease department of the Los Angeles County Hospital.

The gross mortality for the entire series was 84 per cent. However, when the series is broken down into groups one is better able to evaluate the true state of affairs. Group 1 consisted of 19 patients treated only symptomatically. In this group all patients died. Group 2 also had 19 patients. These were treated with serum alone. All received anti-influenzal serum. All died in this group too. Group 3 the sulfanilamide treated patients numbered 13 there was 1 survivor. In the last, or fourth group, there were 12 patients, with 9 survivors or a mortality of about one fourth. The patients in this group were treated with sulfapyridine.

## TREATMENT OF MENINGOCOCCIC MENINGITIS WITH SULFONAMIDES

HORACE L. HODES, MD

AND

PAUL S. STRONG, MD

Captain, U. S. Army

BALTIMORE

Early in 1937 Schwentker, Gelman and Long<sup>1</sup> described the use of sulfanilamide in the treatment of 10 patients with meningococcic meningitis at Sydenham Hospital. Nine of the 10 patients treated recovered. Many other reports confirming the value of this drug in meningococcic meningitis have appeared.<sup>2</sup> It soon became apparent that sulfanilamide was at least as effective in meningitis as antimeningococcus serum. In fact, all the evidence points to the conclusion that the drug is more reliable than serum. For example, in Waghelestein's<sup>3</sup> series reported from Sydenham Hospital in 1938 the mortality rate in a series of 368 serum treated patients was 27 per cent, while among 72 patients receiving sulfanilamide the fatality rate was 15 per cent. As each new sulfonamide drug became available it was employed in meningococcic infections. During the past two years it has become evident that sulfapyridine,<sup>4</sup> sulfathiazole<sup>5</sup> and sulfadiazine<sup>6</sup> are all effective in

meningococcic meningitis. In fact it appears probable that they may be more effective than sulfanilamide, and one or other of them may replace it in the treatment of meningitis.

The present paper deals with 110 patients with meningococcic meningitis who were admitted to Sydenham Hospital between Jan. 1, 1938 and Jan. 31, 1942. During this four year period Baltimore and the vicinity did not experience a large outbreak of meningococcic meningitis, so that it must be considered that these were endemic cases. However, it should be noted that, as judged by the number of patients admitted to the hospital, there was between February 1941 and January 1942 an incidence of the disease which is distinctly greater than usual for Baltimore (chart 1).

## DIAGNOSIS

Nearly all the cases included in this paper presented obvious clinical symptoms of meningitis on admission. Fever, petechial rash, headache, stiffness of the neck, bulging fontanel, delirium and extreme irritability were the most frequent symptoms. Lumbar puncture in all 110 cases revealed turbid cerebrospinal fluid. The diagnosis of meningococcic meningitis was confirmed by smear and culture in all but 5 cases. Four of the 5 patients had received sulfonamide drugs before admission to the hospital.

An attempt was made to type the meningococci isolated from 20 of the patients in the series. Three of these cultures could not be typed, 4 were of group II while the remaining 13 were of group I. This finding may be of some significance, since the organisms of group I are more likely to cause epidemics. They are generally said to be more virulent than those of group II, although group II organisms were isolated from 2 of our patients who were extremely ill.

## TREATMENT

During 1938 and 1939 all the patients in the series were treated with sulfanilamide. During 1940 sulfapyridine was used in a few cases and in 1941 sulfathiazole and sulfadiazine were used with increasing frequency. In fact, all of the last 46 patients were treated with sulfathiazole or sulfadiazine. In all 57 of the 110 patients were treated with sulfanilamide, 36 with sulfathiazole, 10 with sulfadiazine and 7 with sulfapyridine. None of the 110 patients received antimeningococcus serum.

In the treatment of so dangerous an infection as meningococcic meningitis it is essential to administer as quickly as possible an amount of the sulfonamide which will provide the blood and body fluids with a concentration of drug sufficient to halt the spread of infection. At the same time overdosage must be avoided, since extremely high concentrations of the sulfonamides may be attended by toxic effects which may be disastrous in patients who are suffering from severe meningococcic toxemia. The dosage of the sulfonamide derivative must be varied with age and weight and with the severity of the infection, so that each patient must be considered as an individual problem. Nevertheless, we shall describe the plan to which, in a general way, our course of treatment now conforms.

Adults who are only mildly or moderately ill are usually given an admission dose of 4 to 6 Gm. of the

sulfonamide by mouth, while infants and children in this category receive an initial oral dose of 0.1 Gm per kilogram of body weight. One sixth to one fourth of the admission dose is then administered every four hours. If no untoward symptoms appear, this regimen is continued for ten days. Half of this dose is given for the next two days and on the thirteenth day after beginning of treatment the drug is discontinued.

Patients who appear critically ill, as evidenced by high fever, delirium, prostration or stupor, are given an initial oral dose of the sulfonamide derivative which is 30 per cent more than that employed in the cases of mild involvement, and the running dose of drug is correspondingly higher. If the patient is unconscious or delirious, the sulfonamide is given by stomach tube, and this method of administration is continued until it becomes certain that he is able to swallow. In addition to the oral dose of the sulfonamide, severely ill patients are usually given the drug parenterally. Sodium sulfapyridine, sodium sulfadiazine and sodium sulfathiazole are administered intravenously in 5 per cent solution in distilled water or isotonic solution of sodium chloride. The initial dose of these sodium salts is 0.03 Gm per kilogram of body weight, and this amount may be repeated every six, eight or twelve hours as necessary. Sulfanilamide may be given subcutaneously in 0.8 per cent solution in isotonic solution of sodium chloride in doses of 0.05 Gm per kilogram.

Chart 1—Cases of meningococcic meningitis admitted to Sydenham Hospital between 1938 and 1942. Each column represents one month. Each black square indicates a fatal case, each white one a case in which the patient survived.

The concentration of free sulfonamide derivatives in the blood and spinal fluid varied considerably from patient to patient despite efforts to standardize the dosage employed. In general the concentrations were higher among the more severely ill patients who were given larger quantities of the sulfonamide derivative. All but 6 of the 75 patients tested had an average blood concentration of free sulfonamide derivatives above 5 mg per hundred cubic centimeters, while 36 averaged between 5 and 10 mg, 30 between 10 and 15 mg, and 3 were over 15 mg per hundred cubic centimeters. On the whole, the concentration was lower with sulfathiazole than it was when the other drugs were employed.

The concentration of free sulfanilamide, sulfapyridine and sulfadiazine in the spinal fluid was usually between two thirds and four fifths of that in the blood. With sulfathiazole the ratio of free drug in the spinal fluid to that in the blood was definitely lower. Blood and spinal fluid of 10 patients were examined simultaneously for sulfathiazole content (procaine hydrochloride was not used in doing the lumbar punctures). In each instance a measurable amount of the drug was found in the spinal fluid. The concentration in the spinal fluid ranged from one-fourth to a little more than half that found in the blood. An analysis of our data indicates that a blood concentration of free sulfanilamide between 10 and 15 mg per hundred cubic centimeters is sufficient, while

with sulfadiazine 8 to 12 mg per hundred cubic centimeters has always proved effective. When sulfathiazole is employed even lower concentrations of the drug appeared to be effective, and a blood level of 6 to 10 mg per hundred cubic centimeters of this drug is apparently sufficient. Obviously, more severely ill patients

TABLE 1—Age Distribution and Mortality Rate Among One Hundred and Ten Meningococcus Meningitis Patients Treated with Sulfonamides

| Age                  | Cases | Died | Mortality, per Cent |
|----------------------|-------|------|---------------------|
| Under 1 year         | 10    | 1    | 10.0                |
| 1 to 5 years         | 24    | 1    | 4.2                 |
| 6 to 10 years        | 16    | 0    | 0.0                 |
| 11 to 15 years       | 9     | 0    | 0.0                 |
| Total under 15 years | 59    | 2    | 3.4                 |
| Total over 15 years  | 51    | 10   | 19.6                |
| Total all cases      | 110   | 12   | 10.9                |

require more of the sulfonamide derivative than do those who are only moderately ill, and it is impossible to set arbitrary limits for the blood concentrations required. The amount of drug administered must be adjusted to the needs of each patient and the dose varied in accordance with the clinical course of the disease. Nevertheless it should be recalled that overdosage with the sulfonamides may cause symptoms which may lead to the erroneous conclusion that the meningococcic infection is not being controlled. The finding of a blood concentration much higher than those described should bring this possibility to mind.

In every case great attention is paid to general supportive measures. Everything possible is done to make the patient comfortable and to avoid such complications as bed sores, stomatitis and infection of herpetic lesions. With the exception of morphine and its derivatives, sedatives are used freely. Paraldehyde administered intravenously, intramuscularly or by rectum has proved to be the most generally useful drug for the control of the great restlessness, delirium and excruciating headache which make the nursing of patients with severe meningitis so difficult. Fluids are given freely by mouth as well as by venoclysis and hypodermoclysis. Constipation and inability to swallow combine with high

fever to cause severe dehydration and acidosis in many meningitis patients. This is especially true in the case of infants and children, and it is essential to restore the fluid and alkali balance as soon as possible. This is done by the administration of 5 per cent dextrose and saline solution and, when necessary, sixth-molar sodium lactate solution. In older patients it is not uncommon to encounter greatly diminished kidney function, and a large fluid intake is required for this reason also. We do not believe that the fluid intake should be curtailed

in order to obtain a high concentration of the sulfonamide derivative in the blood and cerebrospinal fluid. Enough fluid should be given to maintain normal hydration, acid base equilibrium and kidney function. The patient should also receive whatever dose of the sulfonamide is necessary to insure an adequate concentration of the drug. Occasionally blood transfusion is indicated and appears to be of great value. This is especially true in small infants whose hemoglobin often drops rapidly at the onset of severe meningococcic infection.

We believe that frequent lumbar punctures should be avoided and forced spinal drainage is never employed. As a general rule, specimens of spinal fluid are obtained only on admission and on the twelfth hospital day. Occasionally an additional lumbar puncture is done to reduce dangerously increased intracranial pressure or to determine progress in a doubtful case. Sometimes additional samples of spinal fluid are taken in order to compare the concentration of the sulfonamide in the cerebrospinal fluid with that in the blood.

As long as a sulfonamide derivative is being administered, hemoglobin estimations and white blood cell counts are done every other day and the urine is examined frequently in order to detect any toxic action of the drug as soon as possible. Minor symptoms due to these drugs are of rather frequent occurrence. Vertigo, anorexia and general malaise are especially common with sulfanilamide and sulfapyridine. These symptoms often cause patients considerable discomfort, but they usually need not be regarded as sufficient reason for discontinuing treatment. On the other hand, the occurrence of drug fever or rash, severe leukopenia, rapidly developing hemolytic anemia and gross hematuria should be considered as indications for immediate withdrawal of the drug or, if further treatment is necessary, for changing from one sulfonamide derivative to another. Among our patients the commonest of these more dangerous symptoms was drug fever, which usually began toward the end of the first week of treatment but which, on occasion, was noted as early as forty-eight hours after the beginning of sulfonamide therapy. In our experience it was most common with sulfanilamide and sulfathiazole and sometimes confused the clinical picture considerably. Sulfonamide fever was always suspected when, after two or three days of improvement, the patient became subjectively worse and the temperature rose. Examination of the spinal fluid was of great assistance at this point. If it was found that the cell count had greatly decreased and that the spinal fluid sugar had increased, it was considered safe to withdraw the drug. When an increase in the spinal fluid sugar was noted under these circumstances, cultures of the spinal fluid almost always proved to be negative.

Drug rashes of various types were noted. They were most common in cases in which sulfanilamide or sulfathiazole was given. Four of the 36 patients receiving sulfathiazole developed scleritis and typical erythema nodosum which promptly disappeared when the drug was discontinued. Transient neutropenia with a total white blood cell count below 2,500 was noted twice with sulfathiazole and once among the 7 patients treated with sulfapyridine. Gross hematuria lasting two days was encountered once among the 36 patients treated with sulfathiazole and twice among 10 treated with sulfadiazine, but all 3 of these patients recovered without any evidence of permanent impairment of kidney function.

Acute hemolytic anemia was noted in 3 patients treated with sulfanilamide. One of these patients died as a result of very rapidly developing anemia which began on the second day of treatment. Aside from this, drug complications were not encountered which did not promptly disappear when the sulfonamide derivative was discontinued. The more serious ill effects of the drug did not usually make their appearance before the end of the first week of treatment. By this time it was usually obvious that the patient was well on the road to recovery. Withdrawal of the drug at this point was never followed by a relapse or by a recurrence of the infection.

#### RESULTS

Twelve of the 110 patients (11 per cent) in the series died. One of these deaths was due to acute hemolytic anemia apparently caused by sulfanilamide. One patient died six hours and 1 twelve hours after admis-

Chart 2—Upper curve represents clinical course of patient treated with sulfathiazole. A child aged 3 years was extremely ill on admission; there was rapid improvement and recovery. Lower curve shows prompt recovery of an extremely ill infant aged 20 months treated with sulfadiazine.

sion to the hospital. One man aged 65 who had had precordial pain and dyspnea for a number of years apparently died of coronary disease during convalescence from meningitis. In 4 of the fatal cases there was a history of chronic alcoholism, and 1 of the patients of this group had apparently been on a drinking bout for many days before he contracted meningitis. Our experience with other alcoholic patients with meningococcic meningitis indicates that such patients on the whole do not respond as readily to treatment as do non-alcoholic patients. Whether this is due directly to the effect of alcohol or to the fact that these patients are usually in poor general health and inadequately fed is not clear. It appears to be a fact, however, that the chronic alcoholic addict with meningococcic infection is in greater than average danger of succumbing.

As can be seen from table 1 only 2 children of the 59 under 15 years of age died. One of these deaths

occurred among the 10 infants in the series who were under 1 year of age. This baby entered the hospital, after eight days of the disease, with well developed symptoms of subarachnoid block. A mortality rate of two deaths among 59 patients in the group under 15 years of age is exceedingly low and is especially interesting in connection with the fact that there were ten deaths among 51 adults. The groups of cases in question are too small, however, to warrant the conclusion that sulfonamide therapy is more effective among children than adults. In fact, statistical analysis reveals the fact that the observed difference in mortality rates may be fortuitous. This seems especially likely when one considers that the death rate among the adults, as we have shown, may have been affected by such factors as alcoholism which would not influence the outcome among children. It is nevertheless true that our results with sulfonamide therapy among children have been at least as good as among adults. This is in contrast with our experience with antimeningococcus serum. With this form of treatment, employed in Sydenham Hospital before 1937, the results among children were much less satisfactory than they were in the treatment of adults.

It is apparent that the total of twelve deaths among the 110 patients treated is quite low. Since none of the patients received specific serum, the results obtained clearly indicate the effectiveness of sulfonamide therapy. However, as we have already pointed out, the patients were not treated during an epidemic period, and it is reasonable to assume that the mortality rate during an epidemic would be appreciably higher. Furthermore, we are unable to offer an opinion regarding the advisability of using specific serum in addition to sulfonamide therapy. It is possible that such a combination would have reduced our mortality rate. We have the feeling, however, that if serum is to be employed it should not be administered intrathecally but only intravenously. In our opinion the ill effects of the intraspinal administration of serum would outweigh the advantages it would add to sulfonamide treatment.

Although we have stated that the patients described in the present communication were not treated during an epidemic, it should not be assumed that they were all only mildly ill. On the contrary, many of those who recovered appeared to be critically ill on admission, and a number of them seemed to be moribund. In fact, 58 of the patients were prostrated, comatose, delirious or completely disoriented on entry to the hospital. One of the striking effects of sulfonamide therapy was the rapidity with which these ominous symptoms disappeared. Many patients whose symptoms began suddenly and who apparently were the victims of a fulminating infection improved rapidly after the institution of sulfonamide therapy. Usually improvement was noted within twenty-four or thirty-six hours and nearly always it was apparent after seventy-two hours that the patient would recover.

It is difficult to compare one sulfonamide with another as regards its effectiveness in meningitis. The severity of the disease varies so greatly from patient to patient and from time to time in a community that only the study of a large series of patients treated with each drug during an epidemic can yield conclusive results. Obviously, the patients described in the present paper do not comprise such a group, but our experience to date makes us lean toward the opinion that sulfathiazole, and

probably sulfadiazine, is superior to sulfanilamide. This belief is based not only on the lower mortality rate with these drugs, as shown in table 2, but also on the fact that the response to treatment is more rapid when sulfathiazole or sulfadiazine is used. Patients treated with these drugs have recovered from their stupor and delirium more rapidly than those treated with sulfanilamide, and in general their temperature curve has returned to normal more quickly. Incidentally, it should be noted that every one of our last 43 patients, all of whom were treated with sulfathiazole or sulfadiazine, has recovered. Chart 2 illustrates the type of clinical response obtained with these drugs.

That sulfathiazole is found in normal spinal fluid in relatively low concentrations has been known for some time.<sup>8</sup> Our results and those reported by others,<sup>5</sup> however, indicate that this drug is of great value in meningococcic meningitis. The effectiveness of sulfathiazole, despite its inability to enter the spinal fluid in high concentration, may mean that it is relatively more active against the meningococcus than are the other drugs. Or it may be that the drug diffuses into the meninges, which are the actual site of the infection, in high concentration.

The usual complications and sequelae of meningococcic meningitis were encountered among our patients. The most distressing of these, permanent bilateral eighth nerve deafness, occurred seven times. Five of the patients were children and none of them have shown any signs of improvement. One patient has permanent unilateral fourth and seventh nerve palsy in addition to eighth nerve deafness. Arthritis involving one or more joints occurred in 5 cases. All these patients recovered completely without aspiration or surgical drainage. Five patients showed severe meningococcic conjunctivitis on admission, but all recovered completely under the usual sulfonamide therapy together with local application of the drugs. The low incidence of hydrocephalus was remarkable. Only 1 child showed this complication. This was the infant, already described, who entered the hospital with well defined symptoms of subarachnoid block. One child aged 8 years, who was apparently normal before his attack of meningitis, has shown unmistakable evidence of mental retardation since recovery.

#### CONCLUSIONS

1 One hundred and ten patients with meningococcic meningitis were treated with sulfonamides at Sydenham Hospital in Baltimore between January 1938 and February 1942. None of the patients received specific antimeningococcus serum. No epidemic of meningitis occurred in Baltimore and the vicinity during the four year period studied.

2 Twelve of the 110 patients (11 per cent) died. Only two deaths occurred among 59 children under 15 years of age. One of 10 infants under 1 year of age died.

3 Despite its relatively low concentration in the spinal fluid, sulfathiazole was found to be strikingly effective. This drug and sulfadiazine are apparently superior to sulfanilamide in the treatment of meningococcic meningitis.

## MENINGOCOCCIC MENINGITIS

PROGNOSTIC SIGNIFICANCE OF THE SPINAL  
FLUID SUGAREMILIE RUNDLETT, MD  
ANGELO M GNASSI, MD  
ANDPRESTON PRICE, MD  
JERSEY CITY, N J

Seventeen cases of meningococcic meningitis were admitted to this hospital during the period from July 1941 to March 1942. They afforded us an opportunity to verify two principles, namely (1) that the initial spinal fluid sugar content is inversely proportional to the virulence of the organism and (2) that in favorable cases there is a gradual increase in the spinal fluid sugar as the number of viable organisms is decreased. Repeated quantitative determinations of the spinal fluid sugar have made it possible to predict the outcome in cases showing no clinical improvement. It is to be emphasized that the result of the clashing forces, body resistances and virulence of the organisms determines the severity of the disease.

## CLINICAL FEATURES AND COMMENT

All 17 patients presented classic signs and symptoms of meningitis on admission. Seven patients had petechiae, and of these 5 had bacteremia. The presence of a positive blood culture did not influence the course of the disease if no other complication appeared. However, three of six patients with bacteremia did have

polyarticular arthritis and prolonged fever. This fever persisted in spite of chemotherapy well after the spinal fluid had returned to normal. Perhaps this lack of response to the drug suggests that the arthritis is allergic or toxic rather than bacterial in origin. Two patients had ptosis, which cleared up within three days in 1 instance and ten days in the other.

## METHOD

Quantitative determinations of the spinal fluid sugar were done according to the well known method of

Folin and Wu for blood sugar. Standards used contained 50, 25, 12.5 and 0 mg of dextrose per hundred cubic centimeters. Colorimetric readings below 10 mg per hundred cubic centimeters were considered unreliable and recorded merely as "less than 10 mg per hundred cubic centimeters." Initial sugar determinations were, of course, done on admission, but all dextrose was withheld from the patients during the four hours previous to their subsequent lumbar punctures. On many specimens of spinal fluid, as well as on frequent blood specimens, a modification of the method

Chart 1—Clinical course of meningococcic meningitis in cases 1, 2, 3, 4, 5 and 6.

of Bratton and Marshall was used for the free sulfadiazine content. Discrepancies between the spinal fluid level and the blood level in the accompanying charts are due to the fact that the specimens were not taken simultaneously.

## SPINAL FLUID SUGAR CURVE

1 *Correlation with Smear and Culture*—The spinal fluid of all patients which showed a gradual increase in sugar content had no growth of meningococci in mediums containing 5 mg of para-amino-benzoic acid per hundred cubic centimeters. In only case 5 did a direct smear on a second specimen demonstrate organisms. When the sugar content reached a normal level the spinal fluid itself was invariably cloudy.

2 *Initial High Spinal Fluid Sugar*—In cases 9, 10 and 15 the initial spinal fluid sugar was 40, 36 and 42 mg per hundred cubic centimeters respectively and the infections were mild clinically with rapid recovery. In case 10 sulfadiazine was given for an infection of the upper respiratory tract on admission and the diagnosis of meningitis was made on the third hospital day.

3 *Initial Low Spinal Fluid Sugar*—Cases 3, 5, 6, 7, 8, 12 and 16 represent the normal course of severe infections without arthritis. The spinal fluid sugar gradually rose to normal on the third to the fourth hospital day, while the temperature fell to normal, usually at the end of one week. In case 5, in which admission was made with the patient in coma, the spinal fluid sugar was normal on the third hospital day whereas the temperature remained 102 F. Some patients had a decided fall in temperature on their first day (case 12) but it soon rose and remained elevated until well after the spinal fluid sugar had become normal.

4 *Polyarthritis*—Cases 1, 11, 13, 14 and 17 illustrate a persistent spiking temperature well after the spinal fluid sugar has returned to normal. Each of the patients in this group had polyarticular pain, redness

and swelling which appeared usually on the third or fourth day. In spite of a rising or persistent fever, the normal sugar content of a moderately cloudy spinal fluid indicated that the meningeal infection was controlled. Of the 6 patients with positive blood cultures, arthritis developed in 4 of them.

Chart 2—Clinical course of meningococcic meningitis in cases 7, 8, 9, 10, 11 and 12

CHEMOTHERAPY

The initial spinal fluid was examined bacteriologically and for sugar content. Therapy consisted of sulfadiazine<sup>1</sup> intravenously, orally or rectally and supportive treatment such as intravenous or subcutaneous fluids, sedation and special nursing care. The initial dose depended on the clinical condition of the patient, and the subsequent doses were regulated by the spinal sugar, sulfadiazine levels and clinical condition of the patient. A spinal fluid level of 8 to 12 mg per hundred cubic centimeters was considered desirable for the usual case, and in 2 particularly severe infections a level over 20 mg per hundred cubic centimeters was attained. It is worth while mentioning that in case 17 a total of 25 Gm was given intravenously in the first twenty-four hours. This amount was sufficient to clear the spinal fluid on the fourth day. On the sixth day sulfadiazine was reinstituted for arthritis, and here, as in other instances, the course of the arthritis was not affected.

Chart 3—Clinical course of meningococcic meningitis in cases 13, 14, 15, 16 and 17

In 6 cases transient microscopic hematuria was noted, but this was not considered an indication to stop the drug. Instances of leukopenia or anemia were not encountered. Two children vomited the drug during the first few days of their disease but later retained the drug orally without difficulty.

1 Much of the sulfadiazine used was supplied by Dr D. Brice of the Lederle Laboratories, Pearl River, N. Y.

The results of sulfadiazine therapy were uniformly successful, as in the report of Dingle, Thomas and Morton<sup>2</sup> in which but one death occurred.

CONCLUSIONS

- 1 Seventeen consecutive patients with meningococcic meningitis were treated with sulfadiazine with no mortality.
- 2 A rise in the cerebrospinal fluid sugar is a favorable sign and usually precedes cytologic or clinical improvement. It gives rapid indirect evidence of the bacteriologic status of the spinal fluid more accurately than smear, culture or cell count. However, the latter procedures should not be omitted.
- 3 Sulfadiazine did not influence the course of arthritis of these patients.
- 4 Rectal administration of sodium sulfadiazine may be used as an adjuvant, but an adequate blood level is not obtained by this route alone.

Since this paper was submitted for publication, 6 additional patients with meningococcic meningitis were admitted and treated at our hospital. This represents a series of 23 consecutive patients treated with sulfadiazine without a death.

ARTERIOSCLEROSIS AND VARICOSE VEINS OCCUPATIONAL ACTIVITIES AND OTHER FACTORS

A STUDY OF 536 PERSONS, DIVIDED INTO AGE GROUPS, WHO HAD BEEN SITTING, STANDING, WALKING OR CLIMBING STAIRS FOR TEN YEARS OR MORE AT THEIR WORK

MICHAEL LAKE, MD  
GERALD H. PRATT, MD  
AND  
IRVING S. WRIGHT, MD  
NEW YORK

The present study was undertaken with the primary objective of developing data which might throw further light on our understanding of the production of arteriosclerosis. It was appreciated that certain other factors of interest might be uncovered as the investigation progressed.

Although years of study by numerous workers have been devoted to this great enigma of biology, it can be fairly stated that today it is not known whether arteriosclerosis should be considered as a disease or as a purely degenerative process. The fundamental importance of diet, climate, infection, metabolism, race, heredity and many other factors is yet to be finally evaluated. Age alone does not appear to be responsible, since arteriosclerosis may be present in some persons at 30 years or less, whereas others may show practically none at the age of 70.

A popular hypothesis has been that arteriosclerosis is related to prolonged stress and strain on the arteries. The question in favor of this theory is the oft observed development of calcified plaques at the points of greatest stress in the vessel walls. Aside from this example

2 Dingle, John H., Thomas Lewis and Morton Allan R. Treatment of Meningococcic Meningitis and Meningococcemia with Sulfadiazine, J. A. M. A. 116: 2666 (June 14) 1941.  
Read in part before the Section for the Study of the Peripheral Circulation, American Heart Association, Cleveland, May 30, 1941.  
From the Medical Department of R. H. Macy & Co., Inc., Vascular Clinic of the New York Post Graduate Medical School and Hospital, Columbia University.  
The statistical analyses were made by Miss M. C. McCall.

what constitutes wear and tear on the arteries is an open question. In opposition to this belief, as pointed out by Fox,<sup>1</sup>

the relation of arteriosclerosis to forced work is nil in the wild animals. If one considers the activity of an animal in its enclosure, one finds that those animals that prance, jump, run and climb the most are least affected while those which are rather quiet exhibit the highest incidence of lesions. Those that best illustrate the most pronounced forms of arteriosclerosis—bovine, parrot and ducks—are relatively placid animals.

And again "Arteriosclerosis is not confined to the beasts like horses, that work hard, but also occurs in the placid duck." Thus and other paradoxical evidence regarding the relation of prolonged physical stress and strain to the development of arteriosclerosis served as stimulation to study of the problem herein presented.

#### PURPOSES

The questions concerning which we hoped to obtain information were

1 What is the incidence of arteriosclerosis and of varicose veins in the lower extremities in a normal working population of the two sexes of various age groups?

2 Does prolonged physical stress and strain or posture affect the degree or the rate of production of arteriosclerosis?

3 Does prolonged physical stress and strain or posture affect the degree or the rate of production of varicose veins?

4 Does the use of tobacco or alcohol influence the degree or the rate of production of arteriosclerosis?

5 Is there a difference in the tendency toward the development of arteriosclerosis or varicose veins between persons of the two sexes who have been undergoing similar occupational activity for ten years or more?

6 Is there any relation between hypertension and the development of arteriosclerosis?

7 Do arteriosclerosis and varicose veins tend to occur together?

#### PERSONS STUDIED

A series of 536 persons over 40 years of age representing four different types of occupational activity was studied. Workers of both sexes were included. The classifications comprised persons who had for ten years or more been predominantly

1 Sitting Typists clerical workers and other persons engaged in work which was mainly done sitting.

2 Standing Elevator operators clerks selling behind counters and other persons engaged in work requiring standing.

3 Walking Special policemen, porters cleaning women, furniture salesmen and so on.

4 Climbing Stairs Delivery men and other persons climbing stairs most of the time.

A large department store offered an excellent opportunity for studies of persons of these classifications.

The average duration of employment at the same occupation of the men in the series was approximately twenty years and that of the women seventeen years. The average age for men was  $52.6 \pm 7.7$  years and that for women  $50.8 \pm 7.1$  years. Of the persons studied, 51.5 per cent were over 50 years of age.

#### METHODS

Each person had, in addition to a complete physical examination, study of the lower extremities by the following techniques

1 Determination of any history of pain on walking relieved by rest.

- 2 Inspection for rubor on dependence and pallor on elevation.
- 3 Palpation of arteries and palpation and inspection of veins.
- 4 Oscillometric studies at four levels foot, above ankles, calf and thigh.
- 5 Complete roentgenographic studies of the soft tissues.

#### CRITERIA

The first three techniques were found to be subject to individual interpretation, so that for the purpose of this study any person presenting positive evidence in response to only one of these (history, rubor and pallor or absence of pulse) was considered not to have arteriosclerosis of the arteries of the legs.

TABLE 1—Incidence of Arteriosclerosis of the Leg Arteries in All Groups in the Study

It was realized also that spasm might play an important role in many of the series who had subnormal oscillometric readings.<sup>2</sup> In order to eliminate spasm as nearly as possible only those persons who presented some evidence of arterial disease other than subnormal oscillometric readings and those who had subnormal readings which remained low after warming of the extremities in a foot bath for twenty minutes at 96 to 98 F were considered to have arterial disease.

With the oscillometer used, evidence of disease was considered to be readings of only a faint trace ( $\frac{1}{8}$

<sup>1</sup> Fox, Herbert. Arteriosclerosis in Lower Mammals and Birds. Its Relation to the Disease in Man. chapter 6, p. 153. Arteriosclerosis edited by L. A. Cowdry. New York: Macmillan Company, 1935.

<sup>2</sup> It was impossible to perform experiments with nerve blocks or reflex dilatation on so large a series.

degree or less for each foot) or of zero over the arch of at least one foot (normal being 1/4 to 1 degree)

That the disease demonstrated by the oscillometer in this series was due predominantly to arteriosclerosis rather than to thromboangitis obliterans will be demonstrated later

Roentgenograms of the soft tissue were studied for evidence of calcification and were graded as 1 to 4 plus

TABLE 2—Incidence of Arterial Impairment According to Sex and Age

TABLE 3—Incidence of Arterial Involvement Among Men Aged 40 to 49

|                | Total | Number with Arterial<br>Involvement | Percentage |
|----------------|-------|-------------------------------------|------------|
| Stair climbers | 29    | 11                                  | 38         |
| Others         | 108   | 23                                  | 21         |

in accordance with the degree of severity noted. All calcification shown by roentgenogram was considered to be positive evidence of arteriosclerosis.

It is accepted that the presence of calcification in the arterial walls does not necessarily indicate occlusion or even narrowing of the lumen but nevertheless is definite evidence of arteriosclerosis.

Arteriosclerosis or other disease of the minor vessels in the absence of the changes in major vessels is frequently not detected by roentgen examination, and undoubtedly minor grades of arteriosclerosis were not included.

A certain amount of the material became irrelevant as the work progressed, and in some instances the age group or occupational classification was too small to prove statistically significant. Consequently the data reported is condensed and confined to what we feel to be the most significant facts.

RESULTS

The term arteriosclerosis whenever used in this paper refers to the presence of arteriosclerosis in the arteries of the legs, and calcification refers to calcification in the arteries of the legs. Table 1 indicates the distribution of these conditions in the various age groups and occupational classifications.

SEX AND AGE DIFFERENCES

The total incidence of arteriosclerosis in this series of actively employed people over 40 years of age was found to be 35 per cent. There was a decided difference for the sexes, the incidence for men being 46 per cent and that for women being 26 per cent. As would be expected, there was also an increased percentage of vascular disease with advancing age (table 2).

Arteriosclerosis appeared to develop about a decade later in women than in men.

Occupational Differences—In order to rule out differences due to age and sex, our results were studied for the two sexes by decades and by the four occupational classifications mentioned. The only statistically significant difference due to occupation (table 3) was found among men in the age groups 40 to 49, who showed a much higher incidence of arterial involvement in stair climbers (38 per cent) than in those not climb-

ing stairs (21 per cent). There is not more than one chance in one hundred that this difference is due to sampling.

The number of women stair climbers was too small for statistical analysis. We were unable to show any significant differences among standers, walkers and sitters.

In the age group 50 to 59, the incidence of arteriosclerosis in men who climbed stairs (58 per cent) was no greater than in those who stood (53 per cent) or those who walked (59 per cent). The sitters had a lower incidence (36 per cent), but there were not enough men in this classification for the low figure to be considered statistically significant. This was also true of men over 60.

Among the women there was no difference at all between those who stood (62 per cent) and those who sat (63 per cent). The walkers had a higher incidence (14 per cent), but this also was not considered to be a significant difference.

Roentgenographic Changes—The majority of the instances of pathologic change in both sexes were revealed by roentgenograms. Among the women 91 per cent of the instances of disease were detected by this means, and among the men 95 per cent. Had we used calcification as the only basis for diagnosis the conclusions would have been essentially the same as they were when all cases of arterial involvement were included (table 4).

The difference in the degree of calcification in the two sexes proved to be most interesting. The men had a much higher incidence of roentgenographic changes than did the women. They also showed a much higher percentage of severe (3 and 4 plus) calcification, the incidence being 30 per cent for the men and 12 per cent for the women.

There were no instances of 4 plus changes among the women, but there were 12 cases of such changes among the men. There were 5 cases of 3 plus changes among

TABLE 4—Incidence of Calcification by Severity in the Two Sexes

|       | Total | Number with<br>Calcification | Number with<br>3 and 4 +<br>Calcification |
|-------|-------|------------------------------|---|
| Men   | 305   | 135 (44%)                    | 41 (39%)                                  |
| Women | 231   | 42 (18%)                     | 3 (1%)                                    |

TABLE 5—Incidence of Plaques by Age Groups

| Age Groups (Both Sexes) | Number with<br>Calcification | Percentage with<br>Plaques |
|-------------------------|------------------------------|----------------------------|
| 40-59                   | 40                           | 7                          |
| 50-59                   | 74                           | 10                         |
| 60 and over             | 63                           | 9                          |

the women and 29 cases among the men. Every occupational classification was represented, although there was no statistical significance in any of the differences.

3 The formula used was  $\delta d = \frac{\sqrt{pq(1+1)}}{n_1 n}$  in which  
p = total percentage of occurrence  
q = 1 - p  
n<sub>1</sub> = number in first sample and  
n = number in second sample  
It was necessary for the actual difference between the two percentages to be at least 2.4 times the standard error of the difference in order to be considered significant.  
As a check on this formula the chi square test  $\chi^2 = \frac{(n_1 - n)^2}{n} \frac{1}{(n_1 + n)}$  was applied, and the results agreed with the first formula.

**Calcification with Plaques** Plaques were noted in 18.5 per cent (25) of the men with calcification and in 14.3 per cent (6) of the women. The persons who had 1 and 2 plus calcification had the highest incidence of plaques, 23.4 per cent. Of the persons showing 3 and 4 plus roentgenographic changes, only 9.7 per cent had plaques.

TABLE 6—Incidence of Arterial Disease Among Persons Who Used Tobacco and Those Who Did Not

|            | Percentage With Pathologic Changes | Percentage Without Pathologic Changes |
|------------|------------------------------------|---------------------------------------|
| Men        |                                    |                                       |
| Tobacco    | 45.8                               | 54.2                                  |
| No tobacco | 46.9                               | 53.1                                  |
| Women      |                                    |                                       |
| Tobacco    | 50.0                               | 50.0                                  |
| No tobacco | 39.9                               | 60.1                                  |

TABLE 7—Incidence of Arterial Disease Among Persons Who Used Alcohol and Those Who Did Not

|            | Percentage With Pathologic Changes | Percentage Without Pathologic Changes |
|------------|------------------------------------|---------------------------------------|
| Men        |                                    |                                       |
| Alcohol    | 46.3                               | 53.7                                  |
| No alcohol | 45.7                               | 54.3                                  |
| Women      |                                    |                                       |
| Alcohol    | 19.5                               | 80.5                                  |
| No alcohol | 20.1                               | 79.9                                  |

All the men who showed plaques had normal oscillometric readings. One of the women who had plaques had subnormal oscillometric readings.

As would be expected, the incidence of plaques increased with age (table 5).

**Oscillometric Readings**—The incidence of subnormal oscillometric readings was higher for women with arterial involvement (21.7 per cent) than for men (9.2 per cent). Spasm was a more frequent factor in women than in men. This fact was demonstrated by rechecking of the oscillometric readings after use of warm foot soaks previously mentioned.

**Subnormal Oscillometric Readings Considered as Evidence of Arteriosclerosis** It is felt that the subnormal oscillometric readings in this study can be considered for the most part as evidence of arteriosclerosis. The lesion most likely to be confused would be thromboangitis obliterans. We do not believe that this is an important factor in the present series for the following reasons:

1. No definite case of thromboangitis obliterans was encountered.

2. Among the men, in whom one would expect to encounter thromboangitis obliterans most frequently, the greater incidence of the disease as discovered was in the form of calcification.

3. The incidence of oscillometric evidence of occlusion was equal among the women and among the men.

4. Less than 1 per cent of patients with thromboangitis obliterans are women.

**Symptoms**—Questions relative to pain in the legs and feet were asked in an effort to ascertain the presence of symptoms referable to the disease. Only those persons who gave a specific history of pain on walking relieved by rest were considered as having significant symptoms. Those having other reasons for pain, such as arthritis or weak feet, were not considered as having relevant symptoms.

Only 5.6 per cent of the men and 4.3 per cent of the women who proved to have definite pathologic changes had such complaints.

A question may be raised here regarding the small percentage of employees with definite arterial disease who had symptoms. While the employment factor may have decreased the number of employees who admitted symptoms, it must be remembered that the subjects were active, working people and that if they had pain of any great severity related to activity they would be unable to work.

**Tobacco and Alcohol**—The effect of the use of tobacco on the production of arteriosclerosis also was investigated. Of the men 62.9 per cent and of the women 23.8 per cent smoked. The incidence of arteriosclerosis was exactly the same among those who used tobacco as among those who abstained (table 6).

Tobacco apparently played no determinable part in the incidence of arteriosclerosis in this series. This statement should not be interpreted as decreasing the importance of abstinence from the use of tobacco in cases of already existing vascular disease. It has been proved that the use of tobacco may in such cases produce sufficient vasospasm of the collateral vessels to interfere with the nutrition of the tissues and result in gangrene.

The use of alcohol and its effect on the statistics was studied with similar results (table 7).

It seems that the use of alcohol did not play a determinable part in the incidence of arteriosclerosis in this series. The figures reported have no bearing on the therapeutic value of alcohol in obliterative arterial disease, in which its vasodilating effects are fully recognized. While any attempt to indicate the amount of alcohol habitually consumed would be unreliable, the figures given are fairly reliable, since 72.7 per cent of the men and 35.5 per cent of women admitted using alcohol to some degree.

**The Relation of Hypertension and Arteriosclerosis**—The incidence of arteriosclerosis in persons with hypertension was next subjected to analysis. A systolic

TABLE 8—Incidence of Arteriosclerosis Among Persons with Hypertension and Those with Normal Blood Pressure

|  | Total | Number with Arterial Involvement | Percentage |
|--|-------|----------------------------------|------------|
| All persons with hypertension          | 147   | 63                               | 46.3       |
| All persons with normal blood pressure | 339   | 115                              | 29.6*      |
| Men with hypertension                  | 76    | 45                               | 63.1       |
| Men with normal blood pressure         | 229   | 93                               | 40.6       |
| Women with hypertension                | 71    | 20                               | 23.2       |
| Women with normal blood pressure       | 160   | 22                               | 13.8       |

\* There is only one chance in one hundred that this difference is due to sampling.

TABLE 9—Incidence of Hypertension

|       | Total | Number with Hypertension | Percentage |
|-------|-------|--------------------------|------------|
| Men   | 303   | 76                       | 24.9       |
| Women | 231   | 71                       | 30.4       |

pressure of 150 mm. of mercury was arbitrarily selected as the upper limit of normal blood pressure.

A greater incidence of arteriosclerosis was found among the persons with hypertension than among those without hypertension (table 8). It is interesting to note that 63 per cent of the hypertensive men had arteriosclerosis. Only 28.2 per cent of the women with hypertension had arteriosclerosis.

The incidence of hypertension was slightly higher for women than for men (table 9).

We conclude from these figures that hypertension and arteriosclerosis tend to occur together in both sexes but that either may occur independently

*Varicose Veins*—Studies of the incidence of varicose veins also revealed interesting material Of all persons over 60 years of age, 73 per cent were found to have visible varicose veins There was a decided difference between the two sexes in the incidence of varicose veins In order to rule out the possibility of pregnancy's

TABLE 10—Incidence of Varicose Veins

|                         | Total | Number with Varicose Veins | Percentage with Varicose Veins |
|-------------------------|-------|----------------------------|--------------------------------|
| Men                     | 305   | 125                        | 40.7                           |
| Women                   | 231   | 167                        | 72.2                           |
| Never pregnant          | 133   | 89                         | 66.9                           |
| One or more pregnancies | 98    | 78                         | 79.5                           |

influencing the percentage of women with varicose veins, women who had never had a pregnancy were also considered (table 10)

From the figures we can conclude that women over 40 have a higher incidence of varicose veins than men of the same age and that this difference is not entirely due to pregnancy, since the incidence was higher even when the pregnancy factor was removed from the data

A possible explanation for the difference according to sex may include the noticeable difference in the firmness of the surrounding tissues supporting the venous back pressure, especially during the periods of engorgement of the female pelvic organs The greater use of the leg muscles in the male, with more active emptying of the veins, may also be a factor

The occupational occurrence of varicose veins in men and in women who had never been pregnant was then studied The men who climbed stairs had the lowest incidence, while the other three classifications varied only slightly

Among women, those who sat at their work had the lowest incidence, with the walkers having a slightly higher incidence However, there was not a large enough difference to prove statistically significant (table 11)

The only classification that had the same incidence of varicose veins in the two sexes was the sitters In all other occupations the women showed a much higher incidence than the men

TABLE 11—Incidence of Varicose Veins by Sex and Occupation

|                | Men   |                            | Women (Never Pregnant) |                            |
|----------------|-------|----------------------------|------------------------|----------------------------|
|                | Total | Number with Varicose Veins | Total                  | Number with Varicose Veins |
| Standers       | 89    | 36 (40.5%)                 | 63                     | 47 (73.8%)                 |
| Walkers        | 129   | 53 (41.0%)                 | 28                     | 19 (67.9%)                 |
| Sitters        | 40    | 20 (50.0%)                 | 42                     | 23 (56.8%)                 |
| Stair climbers | 47    | 16 (34.0%)                 |                        |                            |

It appears that when the weight of the venous blood column is increased by standing or walking there is produced a decided increase in varicose veins in women but not in men

*Relation of Varicose Veins to Arterial Disease* There seems to be a significantly higher incidence of arterial disease in men with varicose veins This was true of all age groups In women the difference, while also present, is not statistically significant (table 12)

4 To be considered statistically significant a difference would have to be at least 15 per cent The actual difference is only one and four tenths times the error of the difference It is necessary for the error to be at least two and four tenths times the difference, which in this case would be approximately 15 per cent

This finding is consistent with the results obtained by one of us in improving arterial circulation in cases of advanced occlusion by eliminating the attendant varicose veins<sup>5</sup>

COMMENT

In this study of the relation between sex, occupation, age, tobacco, alcohol, pregnancy and hypertension and the development of arteriosclerosis and varicose veins in the lower extremities, certain interesting observations have been made

Roentgen examination provided the most important single method of detecting arterial changes in this series There were, however, a few cases in which arteriosclerosis in the legs was detected by the oscillometer without changes being demonstrable by roentgen examination

While the figures presented are not of sufficient volume to constitute final evidence, the statistics obtained and subjected to analysis point to the probability that arteriosclerosis of the leg arteries develops earlier in men who climb stairs than in men who do not The statistical difference was considered significant for the age group 40 to 49, but of no consequence in later decades This variation on inquiry did not appear to be due to occupational shift, so that the reason was not obvious The incidence of arteriosclerosis did not seem to vary significantly in the other three occupational classifications Men showed a higher incidence

TABLE 12—Incidence of Arterial Disease Among Persons with Varicose Veins

|                              | Total | Number with Arterial Disease | Percentage |
|------------------------------|-------|------------------------------|------------|
| Men with varicose veins      | 125   | 74                           | 59.2       |
| Men with no varicose veins   | 180   | 67                           | 37.2       |
| Women with varicose veins    | 167   | 37                           | 21.9       |
| Women with no varicose veins | 64    | 9                            | 14.0       |

of arteriosclerosis than did women of the same age groups who had worked at exactly the same types of occupations

Had roentgenographic evidence alone been used, these conclusions would not be changed

While the incidence of subnormal oscillometric readings was small in this series of actively employed persons, the oscillometer was responsible for detecting a larger percentage of arterial disease in women than in men

Of the men who had calcification, 41 (30.4 per cent) showed 3 and 4 plus roentgenographic changes Of the women, 5 (11.7 per cent) showed 3 plus changes The women showed no 4 plus changes The old explanation for such observations, namely that women live a more sheltered and less active existence, was clearly eliminated in this study The explanation is not completely clear, but the results of an experimental study of cholesterol fed rabbits by Ludden, Bruger and Wright<sup>6</sup> may be of interest in this regard In a doubly checked series it was found that the administration of testosterone propionate and estradiol dipropionate exerted no noteworthy inhibitory influence on the development of arteriosclerosis in male rabbits fed cholesterol In female rabbits, however, the development of hypercholesteremia was definitely inhibited and the deposition of cholesterol in the aorta was prevented

5 Pratt, G. H. Segmental Sclerosis of the Superficial Veins and Varicose Veins, Ulcers and Diminished Arterial Supply, J. A. M. A. 113: 925-927 (Sept. 2) 1939  
6 Ludden, J. B., Bruger, Maurice and Wright, I. S. Experimental Arteriosclerosis. IV. Effects of Testosterone Propionate and Estradiol Dipropionate on Experimental Arteriosclerosis in Rabbit Aorta, J. A. M. A. 113: 58 (Jan.) 1942

by the administration of these steroid hormones. In later studies by Bruger<sup>7</sup> it was shown that castration prevented this protection in the female. It appears, therefore, that at least in man and in the rabbit there is a definite difference between the two sexes in the reaction of the arterial walls toward atheromatous-like changes. The exact mechanism is not yet understood.

It appears conclusively proved that neither tobacco nor alcohol had any effect on the development of arteriosclerosis in this series.<sup>8</sup>

The incidence of arteriosclerosis was considerably greater among persons with hypertension than among persons who had normal blood pressure.

Many of the subjects were found to have definite arteriosclerosis, some with considerable calcification and yet had no complaints of pain or fatigue in the lower extremities.

A decided difference between the sexes was noted in the studies of the incidence of varicose veins (40.7 per cent in men, 73.2 per cent in women). While pregnancy accounted for some of this variation even among the women who had never been pregnant 67 per cent showed varicose veins. It was also interesting that the women who sat at their work had definitely fewer varicosities than either those who stood or those who walked, but the men showed no increase at all on standing and walking as against sitting. These observations regarding varicose veins may be associated with the fact that the surrounding tissues of the female are softer and less supportive to the vein walls and also that at times of pelvic congestion there may be a great tendency to back venous pressure. It is also possible that the high incidence of varicose veins in working women over 40 years of age may be related to the wearing of high heels, with resulting compression of the soft vein walls by the leg muscles. Studies in these fields are suggested.

There seems to be some evidence in favor of a definite relation between the development of arteriosclerosis and varicose veins in men. Such a relation in women is not clearly demonstrated by our data.

This study will be of interest particularly in connection with the mobilization of men over 40. In addition, the necessity of manning and fighting from bases in extreme frigid temperatures such as Alaska and Iceland, will increase the importance of the arteriosclerotic problem.

#### CONCLUSIONS

1 Men had a higher incidence of arterial disease than did women of the same ages who had been employed at similar occupations an equal length of time. Among the younger men (age group 40 to 49) stair climbing apparently produced a significantly higher incidence of arteriosclerosis than did standing, sitting or walking. No significant difference could be established among the last three classifications. Over the age of 50 there were no significant differences in the incidence of arterial disease in any of these classifications.

2 The use of alcohol and tobacco did not influence the incidence of arteriosclerosis in the series studied.

3 There was a definite relation in both sexes between the incidence of hypertension and of arteriosclerosis of the lower extremities.

7 Bruger, Maurice. Unpublished results.

8 The findings in reference to alcohol are in complete agreement with the work of M. A. Ruffer who performed autopsies on over 800 Mohammedan pilgrims and found arteriosclerosis as common as in Europeans (Studies on the Paleopathology of Egypt, Chicago University of Chicago Press, 1921). The Mohammedans are exceptionally strict in their total abstinence from alcohol.

4 Women showed a much higher incidence of varicose veins than men employed at the same occupations. This difference held true even when the factor of pregnancy was removed from the data. Women who had been pregnant showed a higher incidence of varicose veins than women who had never been pregnant. Varicose veins were extremely common among the working women of this series.

5 Women who stood or walked showed a much higher incidence of varicose veins than those who sat at their work.

6 This difference was not found in men.

7 There was a higher incidence of arteriosclerosis of the leg arteries in men with varicose veins. This difference was not statistically established in women.

## RENAL COMPLICATIONS OF SULFADIAZINE

WALTER A. KEITZER, M.D.

AND

JOHN A. CAMPBELL, M.D.

AKRON, OHIO

The recent literature concerning sulfapyridine and sulfathiazole renal calculi, causing anuria with at least six deaths reported in a summary of the literature out of 29 cases by Kawaichi and Rogers,<sup>1</sup> and 2 deaths reported by Lindner and Atcheson<sup>2</sup> testifies to the lethal qualities of these drugs. That the new drug sulfadiazine should be devoid of these serious complications, as was suggested by experimental and clinical reports, was optimistic to say the least. Trevett, Nelson and Long<sup>3</sup> found only 4 instances of hematuria, with renal colic in only 2 of 125 patients given sulfadiazine. Billings and Wood<sup>4</sup> treated 105 patients with pneumonia using sulfadiazine intravenously and orally without a single renal complication, i.e. hematuria, renal colic, oliguria or anuria. Borst<sup>5</sup> states that the crystals of the acetylated and active free forms of sulfadiazine are extremely soluble so that renal damage is nil. Finland, Strauss and Peterson<sup>6</sup> in their treatment of 446 patients with sulfadiazine reported only 3 patients having hematuria, 1 of whom had renal colic with anuria requiring ureteral catheterization. Only 1 other patient has been reported in the literature by Hughes, Sayen and La Towsky<sup>7</sup> as having anuria.

In spite of this evidence of the low incidence of renal complications in the literature we have seen 11 patients with various types of renal symptoms or anuria due to sulfadiazine alone, and we have seen as many patients with renal complications due to the other sulfonamides. We feel that there exists a false sense of security concerning sulfadiazine which should be modified because of its increased use in military medicine. One can imagine one's embarrassment trying to treat a soldier

in the jungles of Malaya or the deserts of northern Africa if he is suffering with anuria due to the sulfonamides

The following 4 cases required cystoscopy and ureteral catheterization

CASE 1—J S, a white man aged 36, was admitted to the hospital on Oct 30, 1941 with a cellulitis of the leg. He was given an average of 5 Gm of sulfadiazine daily for nineteen days, at which time he developed right renal pain and oliguria, which progressed rapidly to anuria. The urinalysis reported gross hematuria. The average daily blood level was 10 mg per hundred cubic centimeters, the highest being 139 mg per hundred cubic centimeters, the nonprotein nitrogen was 52 mg per hundred cubic centimeters. A cystoscopy on November 18 showed coarse orange crystals in both ureteral openings and on the bladder floor. There was 15 cc of red brown syrupy urine aspirated from the right kidney pelvis and 7 cc from the left kidney pelvis. The catheters were left indwelling for forty-eight hours and they were irrigated every two to four hours with isotonic solution of sodium chloride. After removal of the catheters the patient continued to complain of left renal colic for the following ten days. An intravenous pyelogram was made which showed nonfunction of the left kidney.

On November 28 a cystoscopy and dilation of the left ureter were done. Fifteen cc of old bloody urine was obtained from the left pelvis. The patient immediately improved and was discharged home on December 12.

CASE 2—R K, a white man aged 24, admitted to the hospital on Jan 13, 1942 with pneumonia, received 4 Gm of sulfadiazine daily for seven days. The drug was then stopped for eight days. He was given 8 Gm on February 19 and 12 Gm the following day, whereupon he developed renal colic over first the left and then the right kidney. Oliguria, followed rather rapidly by anuria, occurred on the third day. The blood sulfadiazine was 96 mg per hundred cubic centimeters. The bladder was catheterized and only 50 cc of bloody urine obtained. A cystoscopy was done and many orange colored calculi were found on the bladder floor, varying in size from a glass headed pin to very small crystals. The ureteral orifices showed small crystals protruding from them. There was 20 cc of muddy appearing urine from the right pelvis and 15 cc from the left pelvis. The indwelling ureteral catheters were irrigated with warm isotonic solution of sodium chloride every two to four hours for thirty-six hours. Retrograde pyelograms showed bilateral, small, nonopaque calculi. The patient gradually improved over a period of five days before he was free from all symptoms. He was discharged on February 28.

CASE 3—R O, a white man aged 21, admitted on Feb 24, 1942 with a compound fracture of the maxilla, a fracture of the nose and facial lacerations, was given 6 Gm of sulfadiazine daily for six days. On the sixth day, the blood sulfadiazine was 8 mg per hundred cubic centimeters, his intake of fluid was 4,560 cc and his output 1,120 cc. He developed renal colic on the right side. On the seventh day his intake was 7,580 cc and his output was only 620 cc. Urinalysis showed a decreased specific gravity, hematuria and many sulfadiazine crystals. He appeared edematous. Cystoscopy and ureteral catheterization were done on March 5, it first being necessary to do a circumcision because of phimosis. The cystoscopy showed a reddish brown bladder urine and a few calculi and crystals on the bladder floor. The right ureteral orifice showed definite bullous edema, as is characteristic in many lower ureteral calculi. The left orifice showed a few crystals protruding from the meatus, but no edema. There was 15 cc of thick bloody urine from the right pelvis, but no residual urine was obtained from the left, owing to mechanical reasons. The ureteral catheters were irrigated with warm isotonic solution of sodium chloride at frequent intervals for thirty-six hours. Retrograde pyelograms were made which showed minimal hydronephrotic changes in both kidneys. The patient was completely relieved in five days and was discharged on March 10.

CASE 4—H B, a white man aged 59, was admitted on March 2, 1942 with a cellulitis of the chin. He received 8 Gm of sulfadiazine daily for four days, when he complained of colic-like pains over both renal areas, radiating to the groins. His intake on the fourth day was 5,580 cc and his output was 1,500 cc of urine. It became increasingly more difficult for the patient to void, and the amount of urine decreased. Urinalysis showed hematuria and albuminuria, with low specific gravity. The sulfadiazine blood level was 11 mg per hundred cubic centimeters and the nonprotein nitrogen 82 mg per hundred cubic centimeters. In view of the high blood nitrogen with oliguria, it was felt imperative to do a cystoscopy on March 6. This showed about 2 Gm of orange colored crystals on the floor of the bladder, which apparently had collected there because of moderate hypertrophy of the prostate with a resulting residual urine. These crystals were recovered and found to consist entirely of acetyl sulfadiazine. The prostate gland showed a 2 plus lateral lobe and median commissure hypertrophy. The right ureteral orifice had typical bullous edema while the left appeared normal. There was 15 cc of red brown syrupy urine aspirated from the right pelvis and 3 cc from the left pelvis. The ureteral catheters were irrigated at frequent intervals for forty-eight hours with warm saline solution. Retrograde pyelograms showed probable nonopaque renal and ureteral calculi in both renal pelves and ureters. The patient continued to have left ureteral and renal colic for a period of five days after removal of the catheters. His residual urine was reduced to 50 cc. The patient refused transurethral prostatectomy and he was discharged home on March 19 with nonprotein nitrogen of 40 mg per hundred cubic centimeters.

The following 7 cases are reported because they illustrate varying degrees of renal complications but were treated conservatively. In the 6 fatal cases summarized by Kawaichi and Rogers, only conservative treatment was employed.

CASE 5—D L, a white boy aged 9 years, was admitted to the hospital on Feb 17, 1942 and operated on for acute appendicitis. An intussusception and an abscess over the appendical stump developed, for which reoperation was performed. He was then given 5 Gm of sulfadiazine for five days. On the fifth day oliguria appeared with hematuria, and the urine output for twenty-four hours was 150 cc. The urine showed hematuria, albuminuria and many crystals. The blood sulfadiazine was 145 mg per hundred cubic centimeters. The drug was stopped, fluids were urged orally and the patient was completely relieved in two days. He was discharged on his twenty-fourth hospital day.

CASE 6—M G, a white girl aged 10 years, admitted to the hospital on Jan 31, 1942 with an acute osteomyelitis of the right hip, was given 6 Gm of sulfadiazine daily for ten days. On the fifth day of the administration of the drug oliguria appeared for twenty-four hours, her output being 240 cc of urine which had a reduced specific gravity and was bloody. The peak blood level was 98 mg per hundred cubic centimeters and the nonprotein nitrogen 34 mg per hundred cubic centimeters. No treatment other than forcing fluids was attempted, and the drug was continued for five days. The oliguria disappeared, but the hematuria persisted until the drug was discontinued. The patient was discharged with a normal urine on the seventeenth hospital day, February 17.

CASE 7—J W, a white woman aged 36, admitted to the hospital on Feb 22, 1942 with first and second degree burns, was given sulfadiazine in the wounds and 6 Gm orally, by mouth, for six days. Her intake was 1,500 cc and output 1,000 cc. On the sixth day she developed nausea and renal colic on the left side. Urinalysis showed a decreased specific gravity, hematuria and many crystals. No oliguria was present. The drug was stopped and 1,500 cc of fluid given intravenously, for a total intake of 2,300 cc and 1,300 cc output the following day. The pain stopped immediately and the urine cleared rapidly. She was discharged home with a normal urine on the seventeenth hospital day.

CASE 8—W C, a white man aged 41, admitted on Jan 8, 1942 with a recurrent osteomyelitis, was given 6 Gm of sulfadiazine daily for nine days. He had an average intake of 4,000 cc and an output of 2,000 cc. On the ninth day there appeared a stabbing pain in the left costovertebral angle radiating to the groin. Urinalysis showed only a decreased specific gravity. No oliguria, hematuria or crystals were reported. The peak level of sulfadiazine was 10 mg per hundred cubic centimeters. The drug was stopped and an intake of 5,040 cc with an output of 2,650 cc was obtained. His pain disappeared in six hours. He was discharged on the thirteenth day with a normal concentrating power of the urine.

CASE 9—G K, a white boy aged 5 years, admitted to the hospital on March 19, 1942 with a foreign body and corneal ulcer of the right eye, was given sulfadiazine 4 Gm daily for three days. The average fluid intake was 1,000 cc and the output was 450 cc. The blood level on March 22 was 15 mg per hundred cubic centimeters. On March 23, the fourth day, hematuria appeared and the urine was loaded with sulfadiazine crystals. The drug was stopped and fluids were forced to 3,000 cc daily. The hematuria persisted for two days. The nonprotein nitrogen was 37 mg per hundred cubic centimeters. The urine was clear on March 25.

CASE 10—A H, a Negro boy aged 2 months, admitted to the hospital on March 15, 1942 with spasmodic croup, received 3 Gm of sulfadiazine daily beginning on March 14. The average daily fluid intake was 1,000 cc. The output could not be determined. On March 18 there were many crystals in the urine. On March 21 there were many crystals, hematuria and albuminuria. The next two days the urine became worse and the drug was stopped on March 24, at which time the urine output was 303 cc. The urine was clear in twenty-four hours.

CASE 11—E M, a white woman aged 73, was admitted to the hospital on March 16, 1942 with a three weeks history of influenza and chronic cough and urinary incontinence for five days. An ulcerating vaginitis due to the staphylococcus was diagnosed. Sulfadiazine 5 Gm was given the first twenty-four hours and then 4 Gm daily. Sulfathiazole ointment 5 per cent was applied to the vagina. On the third day she had severe pain in the lower abdomen. The sulfadiazine was discontinued on the sixth day. Hematuria occurred on the eighth day, with a urinary output of only 870 cc. The following day, March 26, there was only 430 cc of bloody urine. On March 29 the output was 1,350 cc, the urine still showing some blood. Urologic consultation was requested because of hematuria. On March 31 a cystoscopy showed orange colored crystals on the floor of the bladder, which, when analyzed, consisted of pure acetyl sulfadiazine. Pyelograms were normal. The patient was discharged on April 3.

#### COMMENT

Certain conclusions can be drawn from this group of cases. The most striking point is that sulfadiazine is just as toxic to kidneys as any of the other sulfonamides. The drug should not be used without careful daily check of the urinary sediment, and intake and output of fluids should be kept adequate. An output of at least 1,500 cc should be maintained. Likewise the average daily dose ought to be no more than 4 Gm. There are certain conditions that tend to produce renal complications. They are as follows:

- 1 The sudden concentration of the drug, such as results from intravenous administration or large doses orally, may result in a rather rapid and dramatic anuria within thirty-six to forty-eight hours, as noted in case 2.

- 2 Dehydration with a low intake of fluids, even with an average dose of 4 Gm a day, may give renal complications.

- 3 Defects of the urinary tract such as partial obstruction will allow the concentration of the drug with crystal and calculus formation. This was noted in a

4 months old baby with hydronephrosis and hydroureter with infection requiring nephrectomy. A section of the kidney showed the pelvis filled with crystals and calculi of sulfapyridine and sulfathiazole. Another example is patient 4, with hypertrophy of the prostate, whose bladder floor contained 2 Gm of acetyl sulfadiazine.

#### TREATMENT

We feel that the following method of treatment will give good results in any type of sulfonamide renal complications.

- 1 Stop the drug immediately with the first sign of hematuria, renal colic or oliguria. We do not agree with those who contend that hematuria or crystals in the urine are not important as long as anuria does not develop.

- 2 Force fluids. However, a positive water balance of over 5,000 cc should be avoided, since edema of the brain can occur with possible death, as has been reported.

- 3 If oliguria is present with a urinary output of 500 cc or more, a delay of twelve to twenty-four hours before cystoscopy, with the hope that diuresis will relieve the situation may be tried.

- 4 Cystoscopy and catheterization of the ureters should be done immediately when oliguria persists or anuria is present. Delay will only allow further accumulation of calculi. Kawaichi and Rogers,<sup>1</sup> in their summary of the literature, showed that 6 of the 29 patients died, and these had had conservative treatment. Likewise, in 1 of Lindner and Atcheson's 2 fatal cases conservative treatment had been employed.

- 5 The ureteral catheters are left indwelling for periods of twenty-four to forty-eight hours until the return flow of urine is clear. Even this will not remove all the calculi, and if further obstruction occurs there should be no hesitancy in doing another cystoscopy and ureteral catheterization. That these calculi may persist for years has been shown by Newman and Schlesser,<sup>8</sup> who removed a sulfapyridine stone two years later.

- 6 The kidneys should be irrigated with warm sodium bicarbonate solution of 2.5 per cent or warm isotonic solution of sodium chloride. We have at times alkalinized the patient intravenously as well as orally.

- 7 Retrograde pyelograms should be made prior to withdrawal of the catheters.

#### CONCLUSION

- 1 In 11 cases in which renal complications appeared secondary to the administration of sulfadiazine there were no serious consequences, though the potentialities were present.

- 2 Analysis showed that complications usually appeared by the seventh day of drug administration. The average daily dose was 5.5 Gm. The average blood level was 11 mg per hundred cubic centimeters. This would suggest a safe dose of 4 Gm a day with a safe blood level of not over 8 mg per hundred cubic centimeters.

- 3 We believe that sulfadiazine, being better tolerated by the stomach, is therefore a more dangerous drug to produce renal complications because physicians are more likely to be less vigilant.

PREGNANDIOL EXCRETION IN FEMALE  
PSEUDOHERMAPHRODITISM(CONGENITAL ADRENAL HYPERPLASIA)  
STUDIES IN TWO CASES

VALERIE E. GENITIS, M.D.

AND

I. P. BRONSTEIN, M.D.

CHICAGO

The end product of progesterone metabolism, pregnandiol, is determined as sodium pregnandiol glucuronide by a gravimetric method developed by Venning and Browne.<sup>1</sup>

Estimations of this complex have been made by various investigators in normal and pathologic menstrual periods, in normal pregnancy, abortions, toxemias and, lastly, in cases of the adrenogenital syndrome.<sup>2</sup> Except in an isolated case (a child aged 3 years), there have been no data available among children.<sup>3</sup>

The accumulated literature to date has already been well summarized, but it may be well to recall a few pertinent facts regarding the excretion of pregnandiol. This compound is excreted in the urine during the luteal phase of the normal menstrual cycle when the corpus luteum is active and absent during the first half of the intermenstrual phase. The amount of pregnandiol determined for the whole cycle may vary from 34 to 54 mg, although the daily output may be 2 to 10 mg.<sup>4</sup>

During pregnancy the compound is excreted in increasing quantities in the urine as gestation proceeds, when its production is attributed to the placenta. The mean figure as given by Venning<sup>5</sup> is 75 mg a day and by Cope<sup>6</sup> as 55 mg daily, with wide variations. The presence of pregnandiol in association with amenorrhea is suggestive of pregnancy and is to some extent used as a diagnostic aid.<sup>7</sup> The absence or diminution of pregnandiol during pregnancy is indicative of a pathologic condition such as threatened abortion or death of the fetus.<sup>8</sup> There is some difference of opinion as to

the metabolism of pregnandiol in toxemias of pregnancy and the role of the kidney in its excretion.<sup>9</sup> The metabolism of progesterone in the body has been adequately described by Hamblen,<sup>10</sup> Venning,<sup>11</sup> and Cope<sup>6</sup> and includes ovarian, hepatic, uterine and renal factors.

Our interest was stimulated by 2 cases of pseudohermaphroditism which we had occasion to study and in which pregnandiol titers were determined. We speculated as to the diagnostic value of pregnandiol in these cases, and, because of the paucity of data in the young age group, determinations on other children were made for comparison. These include a pubescent boy and girl, 2 girls with prolonged menstrual bleeding, a precocious pubescent child and a Loran-Levi dwarf.<sup>12</sup> These are not included in this report.

The need for total and complete urine specimens was stressed by several groups, but recently Bachman<sup>8</sup> suggested that only a portion of the urine is necessary for analysis. He felt that the general trend of values gives enough information in certain conditions, especially in the last months of pregnancy.

We expected the amount of pregnandiol in the urines of children to be very small, therefore, in order that a sufficient yield of the compound could be obtained large pooled volumes of urine were extracted. In most instances the urines were pooled into forty-eight hour lots and the total volume was extracted. Some times with this procedure the final weighed precipitate was of no significance.

Pseudohermaphroditism is a syndrome applied in cases of virilism with an anomaly of the external genitalia present at birth, that is, an enlarged clitoris, a urethral opening just beneath the phallic structure, as in hypospadias, a vagina that usually opens into the urethra with no external orifice. Howard and White

Fig 1—Appearance of patient 1, a pseudohermaphrodite aged 10 years

hill<sup>13</sup> aver that this congenital abnormality in a patient with ovaries as the gonads is found only in cases of adrenal cortical hyperplasia. They further state that these patients are of small stature. Young<sup>14</sup> described 4 female pseudohermaphrodites who presented the fol-

lowing identical conditions (1) enlargement of the adrenals with hyperplasia of the androgenic zone of the cortex, (2) hypoplastic ovaries and (3) an enlarged clitoris and a persistent urogenital sinus into which the vagina opened. He was the first to examine the urogenital system with the cystoscope in this type of patient and perform successfully plastic surgery.

The pathologic condition of the adrenal gland in pseudohermaphroditism is controversial.<sup>15</sup> Grollman<sup>16</sup> originally attributed the pathologic condition to special "androgenic" tissue but recently postulated that the virilism was due to inclusion testicular rests in the adrenal cortex or to a derangement of steroid metabolism.

Venning, Weil and Browne<sup>9</sup> followed the course in 2 cases of the adrenogenital syndrome by the excretion of pregnandiol in the urine. A woman aged 29 with symptoms of virilism had a carcinoma of the adrenal cortex and excreted 12 mg of pregnandiol daily for seven days. Corpus luteum was not found at autopsy. A woman aged 25 excreted 20 to 30 mg daily for two weeks and showed an enlargement of the left adrenal gland. No further follow-up on the patients was reported. Finkler's<sup>17</sup> patient with this syndrome, a woman aged 25, excreted 21.9 mg of pregnandiol for the first ten days and for the next four days an average

Fig 2—Perineum (patient 1) showing phallic structure

of 29 mg daily. Stover and Pratt<sup>3</sup> found no pregnandiol in the urine of a 3 year old child with the adrenogenital syndrome.

#### REPORT OF CASES

We have studied 2 cases of pseudohermaphroditism in the past two years and extracted the urine for the pregnandiol complex.

CASE 1—L G, a 10 year old child (fig 1) was referred because of cessation of growth in the last two years. This patient as well as patient 2 was thoroughly studied from the point of view of physical development (sexual and menstruation) and complete laboratory studies, including roentgenograms of the head (sella), wrist and knee, fundi and visual fields, basal metabolism, blood cholesterol and sugar tolerance in addition to roentgenographic cephalometric appraisal. Delivery was normal, a mass noted in the perineum at birth increased steadily in size. Pubic hair appeared at 3 years and the voice deepened at 5 years. Play and demeanor were masculine and the psychological tests coincided with this observation. The child looked older than the chronological age, the voice was husky, the muscular development pronounced and masculine distribution of hair was noted.

Fig 3—Pregandiol excretion (patient 1) over a period of twenty eight days

Examination of the perineum (fig 2) revealed a large phallic structure with an orifice at the base, which on probing and endoscopy demonstrated a urethra and a vagina. Testes and a scrotum, bifid or otherwise, were not demonstrable. Studies with iodized poppyseed oil confirmed our suspicions in outlining what seemed to be a vagina and a uterus. Retrograde pyelograms were negative. Roentgenograms of a wrist and knee gave evidence of premature epiphyseal closure.

The urinary 17-ketosteroids were twice normal at the beginning of the study and a year later four times normal (30 and 69 mg in twenty-four hours, respectively).<sup>18</sup> The urinary gonadotropic assay<sup>19</sup> was less than 66 mouse units per liter and the estrogenic assay negative. Pregandiol was excreted in increased amounts ranging from 0.34 to 197 mg in forty-eight hours (fig 3). An exploratory laparotomy was advised and refused. At the insistence of the parents and because of their interpretation of the milieu as being masculine they entered the child in a new school as a boy and the entire activity and association is now as a male. At a recent visit no regression of symptoms was noted but both the parents and the child exhibited a happier frame of mind. Statural growth, as was expected, remained the same.

CASE 2—P M, a 4 year old child was born as a girl, but the parents were told at the time of delivery that there was an enlargement of the clitoris. Her appearance was that of an 8 year old, with deep voice and pubic hair. An orifice was noted at the base of the enlarged clitoris. A bone age of 12 years was determined by roentgenograms of the wrists. Examination of the skull was negative for a sellar abnormality. A genitourinary examination by endoscopy and injection of iodized oil demonstrated a vagina and a cervix similar to those described in case 1. Vaginal smears showed no cornified epithelium.

The 17-ketosteroids were increased in amount (37 mg in twenty-four hours). Gonadotropic assays were less than 66

mouse units per liter of urine. Urinary estrogenic assays were negative. Pregnandiol determinations at various intervals showed an increase in several specimens, a 20 mg yield in the one forty-eight hour analysis. Pregnandiol was not recovered in some of the other specimens.

Laparotomy was done and female organs were visualized and interpreted as showing no gross abnormality.<sup>20</sup> There was a suspicion that the right adrenal gland was slightly enlarged, but no tumor masses were palpated. A posterior approach at a later date is contemplated with the idea of resecting the adrenals.

The 2 cases are duplicates as regards description.

#### COMMENT

We determined the titer of pregnandiol in 2 pseudohermaphrodites. There are few figures for comparison, not only in this age group but in this syndrome, as most of the work has been done on adults with obstetric problems.

The pseudohermaphrodites excreted pregnandiol in varying amounts. In a study of adult patients with the adrenogenital syndrome higher titers were found, and it is possible that the compound increases in amount as the condition progresses. Stover and Pratt's 3 year old pseudohermaphrodite excreted no pregnandiol and our 4 year old child excreted irregular amounts. Perhaps the difference in amount is due to one of the other factors influencing the metabolism of this steroid compound. That the adrenal cortex may elaborate progesterone is possible, for there exists a close relationship in structure between progesterone, androgens, cholesterol and desoxycorticosterone. Further work is indicated for correlating endocrinopathies and pregnandiol excretion. The extraction of large amounts of urine in children is needed to obtain a sufficient yield of the compound. Perhaps studies made daily or at short intervals may reveal significant data if done over a long period of time. With adolescent problems, in lieu of other criteria of maturation, pregnandiol values may be used to indicate the general trend of ovarian function.

#### SUMMARY

Pregnandiol titers in pseudohermaphroditism are definitely elevated and suggest an adrenal factor.

More data are desirable in children before normal ovarian function at puberty can be gaged. Pregnandiol determinations may be made a basis for study of disturbances in this period and may be related to various endocrinopathies.

Since this paper was submitted, patient 2 had a partial adrenalectomy in March 1942 and microscopic section revealed a small adenoma. We have also studied a third pseudohermaphrodite, aged 15 years, whose internal organs were feminine. Partial adrenalectomy was performed and hyperplasia was found on microscopic study, suggestive changes appeared several months later. In the 15 year old patient we were able to obtain only one preoperative pregnandiol value of 36.2 mg in twenty-four hours.

<sup>20</sup> Sections of the ovaries, both right and left showed increased density of the stroma surrounding the follicles. They seemed to have reached the stage of development of early puberty, and there was evidence of atresia of the follicles.

**Intestinal Digestion**—The intestinal juice contains at least five enzymes: enterokinase, by the action of which trypsinogen is converted into trypsin, erepin, which produces further cleavage of the proteoses and peptones into amino acids, and the three enzymes sucrase (or invertase), maltase and lactase, which hydrolyze respectively the three disaccharides sucrose, maltose and lactose.—Sherman, Henry C. *Chemistry of Food and Nutrition*, New York, Macmillan Company, 1941.

## ACID FAST ORGANISMS IN SPUTUM WITH NORMAL OR QUESTIONABLE ROENTGENOGRAPHIC FINDINGS

FRANCIS B. TRUDEAU, M.D.

AND

ROBERT L. YEAGER, M.D.

TRUDEAU, N. Y.

A rather rare but often puzzling problem for physicians who deal primarily with abnormal conditions of the chest is the case in which tubercle bacilli are or have been reported found in the sputum and yet the x-ray films fail to show any definite parenchymal lesion. Are we to put our entire faith in the x-ray film and disregard the positive sputum, allowing the patient to continue a normal life, or are we to tell our patient that he has clinical tuberculosis which needs treatment, in spite of the negative or questionable roentgen ray finding?

In order to help us determine our course of procedure in this type of case, we went over the records of our patients at the Trudeau Sanatorium for the past thirty years and picked out all those of patients who had come to us either because they had been told by their physician that tubercle bacilli had been found in their sputum or because these organisms were found in our own laboratory while their roentgenograms taken at the sanatorium failed to show any definite pulmonary involvement. By following these patients each year after leaving the sanatorium, we believed that we should be in a position to evaluate more clearly the significance of these particular findings. As a coincidence we were able to find exactly 100 cases—an incidence of 1.5 per cent of admissions studied—which filled the aforementioned requirements, although in 6 of these the roentgenogram showed a slightly more than questionable lesion. The present report is based on these 100 cases.

The first point which we wished to clear up was whether the offending organisms were found previous to the patient's entering Trudeau Sanatorium or in our own laboratory. Our figures show that slightly over half of the patients, 55, came to us as a result of the positive sputum having been found in an outside laboratory, while in 37 instances the organisms were first demonstrated while the patients were under treatment with us. In only 8 cases were the previous positive findings confirmed in our own laboratory.

The next point which seemed of significance to us was the number of times that tubercle bacilli were found in the sputum in each case, as it would seem that the more often the bacilli were demonstrated in individual cases the more significant the finding would be in regard to the prognosis. A single positive finding was reported in 75 of the cases, while in 13 cases a positive report was obtained two to three times and in 12 cases the sputum showed organisms over three times. It is particularly interesting that of the last 12 patients the follow-up records show that 8 have reported themselves continually well for five, seven, seven, nine, ten and thirty years, 2 had relapses but were well at the end of fourteen years, while 1 died of tuberculosis in the sixth year and 1 has not been heard of since discharge.

We then tried to bring out the significance of the Gaffky count in this series. Of course it must be remembered that many of these cases were studied long before this method was used and that most of the patients in whose sputum the organisms were found

before coming to us had no history of a Gaffky count. Our observations show that this was true for 57 of our patients, while of the 43 remaining patients for whom we have a report 13 had a Gaffky I and 25 a Gaffky II or III while in 5 cases the count was over Gaffky III, a Gaffky VI being the highest recorded. In cases in which more than one count is reported we have used only the highest one in each case. Again, in studying the follow-up records of our 5 patients with more serious conditions, those whose Gaffky count was over III, it is interesting to note that all of them are reported as well over a period of seven, seven, fifteen, fifteen and thirty years respectively.

For the past eighteen years, basing our belief on the statistical studies of Brown and Heise<sup>1</sup> we have felt at Trudeau Sanatorium that in order to make a positive diagnosis of pulmonary tuberculosis number 4 or 5 of the following diagnostic criteria should be present or, in their absence any two of the first three: (1) history of hemoptysis of a drachm (37 cc) or more of blood, (2) history of simple wet pleurisy, (3) persistent moderately coarse rales in the upper third of the chest, (4) parenchymal changes shown in the roentgenograms and (5) tubercle bacilli in the sputum.

In this study criterion 5 was present in all cases and criterion 4 roentgenographic changes, was absent. Nine patients gave a history of hemoptysis of a drachm or more of blood, while many others had had streaked sputum. Eight gave a history of pleurisy with effusion. Eleven had rales in the upper third of the chest. Two patients had apical rales on physical examination, in addition to having had hemoptysis, while 3 had similar rales and an associated pleurisy with effusion. In 67 cases there was no history of hemoptysis or pleurisy and no rales were heard. In 33 cases there was, in addition to the reported positive sputum, at least one of the other cardinal symptoms, yet the roentgen study failed to confirm this rather definite diagnosis.

We were indeed most fortunate in following up this series of cases, for in only 1 were we unable to find at least one year's report. Forty of the cases were followed from one to ten years and 39 from eleven to twenty years, while in 21 we received word as to the physical condition for over twenty years. Our classification at the end of this time is as follows (table 1).

TABLE 1—Follow-Up Study from One to Thirty Years on the Hundred Patients Here Reported

| Years After Leaving Sanatorium | Well | Relapsed and Well | Relapsed and Alive | Relapsed and Chronic | Dead | No Report | Total |
|--------------------------------|------|-------------------|--------------------|----------------------|------|-----------|-------|
| 1 to 10                        | 31   | 4                 | 0                  | 0                    | 4    | 1         | 40    |
| 11 to 20                       | 25   | 5                 | 2                  | 1                    | 3    |           | 36    |
| Over 20                        | 15   | 3                 | 0                  | 0                    | 0    |           | 18    |
|                                | 71   | 12                | 2                  | 1                    | 7    | 1         | 94    |

The patients under the heading of "well" are those who have been well or working, or at least able to do so, and have had negative sputum for at least two years. "Relapsed and well" refers to those patients who reported that they had had a relapse some time after leaving us but had recovered from this and at the time

of their final report were well. "Alive" refers to those patients concerning whom we could find nothing relative to their physical condition except the fact that they were still living. "Relapsed and chronic" is self explanatory, as is the last classification, "dead." It will be noted that 77 of the 100 patients were "well" after hav-

TABLE 2—Cause of Death

| Patient | Cause                | Years After Leaving Sanatorium |
|---------|----------------------|--------------------------------|
| 1       | Tuberculosis         | 6                              |
| 1       | Unknown              | 9                              |
| 1       | Asthma               | 9                              |
| 1       | Suicide              | 11                             |
| 2       | Carcinoma of colon   | 4 and 12                       |
| 1       | Carcinoma of stomach | 16                             |

ing left the sanatorium from one to thirty years ago, 12 had relapses but again regained their health, 2 were reported as simply "alive," while only 1 came under the heading of "relapsed and chronic" at the time of the last report. Seven had died, while only 1 failed to send in a report.

The cause of the 7 deaths (table 2) is indeed most interesting especially since only 1 patient was reported as having died of pulmonary tuberculosis six years after leaving the sanatorium. One patient was reported as having died of "cause unknown" nine years after leaving us and after having sent in a report of "well" during the eight previous years. Although we cannot be certain, this does not sound like death due to tuberculosis. One patient died of asthma nine years after leaving the sanatorium, 1 committed suicide, the remaining 3 were of particular interest as having died of carcinoma of the intestinal tract, the colon being affected in 2 and the stomach in the remaining 1. Death occurred four, twelve and sixteen years respectively after leaving the sanatorium in these 3 cases. We are rather at a loss to explain this, and possibly it is merely a coincidence.

An examination of the histories of these patients reveals that 3 of them had been sent here with a diagnosis of renal tuberculosis and the positive sputum was found on routine examination. The remaining 97 all gave a history of such symptoms as streaking, chronic fatigue, continuous low grade fever, cough or expectoration, in the majority of instances over a period of many months before admission and for which medical advice had been sought. Their average length of stay in the sanatorium was four months. Their treatment was the usual hygienic dietetic regimen, practically all of them being ambulant throughout their stay. There was no collapse therapy done.

The question of the reliability of the reported findings of acid fast tubercle bacilli must be considered. It is possible that some of these represent laboratory errors. Others may be due to nonpathogenic acid fast bacilli. The number of cultures and guinea pig inoculations that were done in this series was too small to be statistically important, for 80 per cent of these patients were admitted before 1930, before which time cultures and guinea pig inoculations were not routinely done. The facts that all of these patients had symptoms suggesting chronic illness that many had an associated pleurisy with effusion, hemoptysis or rales and that the number of reported relapses was similar to that expected from a minimal group suggest that the diagnosis in the majority of instances was valid.

1 Brown L. and Heise F. H. The Value of the Trudeau Sanatorium's Five Diagnostic Criteria of Pulmonary Tuberculosis in Negative Diagnosis Study of 264 Cases Admitted to the Sanatorium Diagnosed as Nontuberculous and Followed Up from One to Seven Years. *Am Rev Tuberc* 9:398 (July) 1924.

## SUMMARY AND CONCLUSIONS

One hundred cases with reported positive sputum and negative or questionable roentgen ray findings were followed for one to thirty years after discharge.

In this series 12 patients had relapses during this time and there have been 7 deaths, only 1 of them being reported as due to pulmonary tuberculosis.

Although it is possible that in a small number of these cases the acid fast organisms found were nonpathogenic or due to a laboratory error, the very favorable prognostic significance of negative or doubtful roentgen ray findings in cases of suspected pulmonary tuberculosis, even though the sputum is reported as positive, seems to be clearly demonstrated.

JAMES D. GARDNER, M.D., Major, M.C., U.S. Army

KENNETH R. BELL, M.D., Captain, M.C., U.S. Army  
AND

A. JACK TANNENBAUM, M.D., Captain, M.C., U.S. Army  
CAMP CLAIBORNE, LOUISIANA

L. H., a nurse in the Army Nurse Corps, was admitted to the surgical service of the Station Hospital, Camp Claiborne, La., on Sept. 20, 1941 immediately after an automobile accident in which she sustained a severe laceration of the lower lip and the chin and fracture of both maxillas and palatine bones, which separated as a single unit from all bony attachments. There was a displacement of the maxillas 1 cm posteriorly and superiorly, accompanied by severe hemorrhage of the posterior nasal and maxillary vessels, which was controlled by stabilization of the maxillas with an emergency dental and elastic tension splint in conjunction with an orthopedic plaster head cap.

The lacerations of the soft tissue were repaired and 1,500 units of tetanus antitoxin was administered. A roentgenogram on September 21 revealed a comminuted fracture of both nasal bones with fracture of the cartilage on the left side. Therapy at this point consisted in periodic intranasal instillation of 1 per cent ephedrine sulfate in saline solution. It was deemed unwise to consider any manipulations of the fractured nasal bones at this time because of the considerable amount of local swelling that was present and because of the danger of widening fracture lines already communicating with the base of the skull.

The patient's temperature ranged within 1 degree of normal until September 28, when there was a sudden elevation to 105 F., the pulse rate was 120 and regular, the respiratory rate 30 per minute and the blood pressure 128 systolic and 64 diastolic. She soon became irrational. Six Gm. of sulfapyridine sodium in 150 cc. of sterile distilled water was administered by vein and followed with 1,000 cc. of 5 per cent dextrose in saline solution. The pulse was of poor volume and weak but regular. Within six hours the temperature dropped to 101 F., the patient's condition generally appeared much improved, and she had cleared mentally by the morning of September 30. Since the initial intravenous dose of 6 Gm. of sulfapyridine sodium she continued with the drug, taking 1 Gm. of sulfapyridine orally every four hours.

From the Station Hospital

Dr. Bell died on Dec. 4, 1941

Valuable consultation was rendered in this case by Capt. Leon Ferber, Chief of Neuropsychiatric Section, and Capt. Paul A. L. Black of the Ear, Nose and Throat Clinic, Station Hospital, Camp Claiborne, Louisiana.

On the morning of September 30 physical examination revealed that the right palpebral fissure was narrower than the left because of ptosis of the right upper eyelid. The right pupil was irregular and smaller than the left. The fundi were of normal color and appearance, and there was no edema. A coarse estimation of the visual fields revealed no defect. The abdominal reflexes were absent bilaterally. The left knee jerk was hyperactive, and a positive Babinski reflex was elicited on the right. The neck appeared to be moderately stiffened and Kernig's sign was present. There was an impairment of extraocular movements on the right indicating involvement of the third, fourth and sixth cranial nerves. A lumbar puncture was done, and 4 cc. of cloudy fluid under slightly increased pressure was removed, with a count of 450 polymorphonuclear cells.

At this point it was believed that we were dealing either with meningitis or with an early brain abscess of the middle brain fossa on the right side or a combination of the two. On October 1 the patient appeared generally improved, but there were severe edema and ptosis of the right eyelid. The results of the remainder of the neurologic examination were unchanged. On October 2 the ptosis of the right eyelid was extreme. There was considerable proptosis of the bulb with definite fixation. There was considerable swelling surrounding the right orbit and extending into the right temporal region. No tenderness could be elicited on pressure on the eyeball, and extraocular tension was increased. The conjunctiva protruded with edema. The pupil, still small and irregular, barely reacted to light. Ophthalmoscopic examination revealed considerable distention of the central retinal vein of the right eye. Extraocular movements continued to be impaired. The neck continued stiff and painful, and the Kernig and Brudzinski signs were present. The left knee jerk continued hyperactive. At this time it was believed that the patient had a definite cavernous sinus thrombosis on the right.

On October 5 a culture of blood taken on September 29 was reported to have grown *Staphylococcus aureus*. Sulfapyridine therapy was discontinued and sodium sulfathiazole administered by vein in doses of 3 Gm. in sterile distilled water every six hours, until a level in the blood of 4 mg. per hundred cubic centimeters was obtained. Then a dose of 1 Gm. of sulfathiazole was given orally every four hours. The rectal temperature continued between 101 and 103 F. The general condition of the patient was fair. Considerable moist and crepitant rales became manifest throughout the chest. There was a moderate cough with profuse expectoration of purulent sputum which had no particular odor. Examination of the sputum revealed a short chain streptococcus to be the predominating organism with considerable blood and pus. No fusiform spirochetal organisms could be found. A roentgenogram of the chest (fig. 1) revealed four pulmonary abscesses each approximately the size of a 50 cent piece (30 mm.). Two were located in the lower lobe of the left lung and two in the midcentral portion of the right pulmonary field. The dose of sulfathiazole was increased to 2 Gm. every four hours, and further symptomatic therapy continued to include daily blood transfusions ranging from 100 to 250 cc. each with sufficient dextrose and saline solution given by vein to maintain proper food intake. In addition, together with vitamin preparations, considerable liquid proteins were administered through a nasal tube in order to balance the diet. A culture of the blood which was taken on October 7 was reported positive on October 19 for *Staphylococcus aureus*.

On October 21 the patient experienced a sudden loss of consciousness, accompanied by a typical Jacksonian seizure beginning with clonic twitchings of the right side of the mouth and then spreading to include the entire right side of the face. Her head turned jerkily to the right. This was followed by atonic convulsion of the left arm, forearm, and hand and of the left leg. These movements quickly subsided to become a generalized seizure. This syndrome recurred several times within fifteen minutes, following the initial

Sodium amytal was administered intravenously for control of the episode. On awakening from the action of the drug, she continued in a highly restless state with frequent aimless motions of the arms. It was believed at this time that the patient's clinical signs and symptoms were the result of a cerebral embolus or of an abscess located in the right motor area.

All the former external signs of cavernous sinus thrombosis had gradually begun to disappear by this time. The proptosis and edema about the right eye had receded. However, on October 23 the patient suddenly showed a red papular eruption over the elbows, knees, arms and legs. The lesions were warm and centrally spotted and were surrounded by a purplish coloration which faded off into the normal surrounding tissue. Initially they measured about  $\frac{1}{4}$  inch (0.6 cm) in diameter and gradually increased in size, in some instances to  $\frac{1}{2}$  inch (1.2 cm) in diameter. This was believed to be an integral part of the embolic shower, the etiologic reservoir of which was in the pulmonary abscesses. At the same time there developed severe gross hematuria believed to have originated in the embolic shower. The blood urea nitrogen content was 16.8 mg per hundred cubic centimeters and the creatinine content 2 mg per hundred cubic centimeters.

Fig 1—Four pulmonary abscesses

Fig 2—Improvement of the pulmonary abscesses can be noted

Fig 3—The abscesses are completely healed

This state existed for one week. The patient remained comatose or semicomatose. The embolic cutaneous lesions gradually lost their reddish hue and tapered off into a purplish coloration. On October 31 it was apparent that there was extensive paresis of the left arm and left leg. All evidence of the previously existing cavernous sinus thrombosis had disappeared. However, after the sudden onset of gross hematuria, which lasted for two days, there was a gradual decline in the urinary blood until it was apparent only microscopically. A gradually increasing pitting edema was becoming more apparent every hour until after forty-eight hours a state of mild to moderate anasarca existed. In addition there appeared severe tympanites but there was no evident melena. A culture of the urine at this time was positive for *Staphylococcus aureus*.

During this episode the concentration of sulfathiazole in the blood was maintained at 25 to 33 mg per hundred cubic centimeters for six days. Cultures of blood taken subsequently were reported negative for any growth. After the maintenance of this high level for six days the drug was withdrawn. Roentgen examination of the lungs revealed that the pulmonary abscesses were healing (fig 2). Multiple small transfusions of whole blood were administered and all foods liberating the sodium ion were eliminated from the diet. Two days after elimination of the drug the sensorium had cleared completely. The generalized edema was disappearing, and the formerly affected right eye became perfectly normal. A roentgenogram of the chest at this time revealed complete healing of all four pulmonary abscesses (fig 3). Except for severe muscular wasting the patient appeared her normal self again, having

regained complete function in the left arm and leg. As a precaution against any latent residual infection, medication with sulfathiazole, in a dose of 1 Gm three times a day, was continued for three months from the date on which chemotherapy was instituted.

#### COMMENT

Early in the second week of convalescence our patient presented Eagleton's<sup>1</sup> six diagnostic signs used as criteria of cavernous sinus thrombosis: (1) fracture of both maxillas with infection, (2) *S. aureus* infection of the blood stream, (3) venous congestion with thrombosis of the central vein of the right retina, (4) paralysis of the third, fourth and sixth cranial nerves on the right, (5) periorbital cellulitis involving the temporal region and (6) subsequent development of pulmonary abscesses. Recognizing our predicament, we were fully aware of Schall's<sup>2</sup> success in using heparin with chemotherapy and of Bancroft's<sup>3</sup> advice along the same line. Nevertheless, having seen the brains which Mallory demonstrated at the Massachusetts General Hospital, showing the vast cerebral hemorrhages following the administration of heparin, and remembering his and Libman's opinion with regard to the use of heparin, we proceeded as we had been, placing all confidence in chemotherapy. Since the organism recovered from the blood

was *Staphylococcus aureus* we used sulfathiazole. Our initial attempt to build up a high concentration of the drug in the blood necessitated our giving it intravenously 6 Gm at a time and then continuing administration of the drug through a Levin tube directly into the small bowel. Initially we used sulfapyridine (as did Lyons<sup>4</sup>), not knowing at the time the particular organism with which we were dealing. Because of the sudden violent clinical manifestations we believed the cause of infection to be a streptococcus. However, as soon as *Staphylococcus aureus* was identified a change was made to sulfathiazole. During the early stage of the illness there evidently were infected emboli traveling the venous pathway only to localize in the lungs resulting in four pulmonary abscesses as noted on roentgen examination. However, our efforts at establishing an extremely high concentration of sulfathiazole in the blood prevailed, and concentrations ranging from 25 to 33 mg per hundred cubic centimeters were maintained for six days during the most critical stage of the illness. We feel that this prolonged high concentration of sulfathiazole in the blood stream was imperative. Many factors, all of which were discouraging seemed to follow one after the other as one might expect from a patient refusing to die early in cavernous

ous sinus thrombosis After the appearance of the lung abscesses, arterial embolism developed to a considerable degree. Emboli were scattered over both the upper and lower extremities, and finally there ensued convulsive seizures, jacksonian in character, with a left hemiparesis and prolonged unconsciousness for thirteen days, during which severe gross hematuria occurred which lasted two days.

The various arguments present themselves at this point. Was this unconscious state the result of single or multiple infected cerebral emboli, or was the extremely high concentration of sulfathiazole in the blood producing cerebral edema? If the latter, then how could one explain the left hemiparesis and facial weakness? We are therefore inclined to feel that our patient perhaps did have multiple small cerebral abscesses which yielded to treatment and healed, just as we know that the pulmonary abscesses healed as a direct result of the maintenance of sulfathiazole in a high concentration in the blood stream.

The gross hematuria we attribute to renal infarction during which the patient lost considerable amounts of protein, the albumin-globulin ratio being reversed to such an extent that anasarca developed. No evidence for a nephrotic state could be detected, and we are therefore of the belief that the anasarca was purely the result of hypoproteinemia. From the onset of this state she was given considerable amounts of protein through a nasal tube, multiple small daily blood transfusions, intravenous injections of calcium and milk by mouth to replace the calcium lost with the albumin. Lastly, all food liberating the sodium ion was removed from the diet. Within four days there was a reversal of the tissue fluid balance, after which the convalescence was rapid and uneventful.

#### CONCLUSION

In a case of cavernous sinus thrombophlebitis the maintenance of a sustained concentration of sulfathiazole in the blood of 25 to 33 mg per hundred cubic centimeters resulted in a complete cure even after pulmonary abscesses and arterial embolism ensued.

#### ADDENDUM

The following is a final note by Henry W. Brosin, Captain, M. C., Chief of Neuropsychiatric Section, LaGarde General Hospital, New Orleans:

On superficial examination the patient was an alert, fairly well oriented, mildly cooperative, unmarried white woman aged 34, who looked much older. She was tense, anxious, restless, picking at her face and fingers, moving her body quickly from one position to another, apparently anxious to escape the examination situation. She attempted to put up a good front with an offhand manner suggestive at times of an empty euphoria. She attempted shallow humor to shield her underlying apathy and depression. Strong effort was made to deny the existence of all organic injury or residuals with the claim that she could do full duty if only the doctors would cure her headache and frequency, urgency and dysuria. She boasted of her ability to prescribe for herself, insisting that no doctor understood her as well as she understood herself. After some weeks she claimed to be able to control the headache by the use of ephedrine nose drops and gargles. In speaking of her urinary difficulties she became frankly vulgar in her attacks on the physicians' inability to help her, a state of mind which was in sharp contrast to the primness which characterized her behavior before the accident. Visiting nurses who knew her before the accident were explicit in their description that she was now an entirely different woman because of her restlessness, use of vulgarity, aggressiveness, irritability and unreasonableness. There was an inappropriate affect noted in this patient when she spoke about her mother and other intimates. Her recent and remote memory were apparently fair, but careful examination elicited difficulties in both spheres. The content was that of regression in a neurotic adult. The sensorium

was clear but suggestive of the deterioration due to organic damage to the cortex in her decreased ability to do problems and comprehend abstractions.

It was the opinion of this staff that the patient showed frank evidence of organic deterioration of the cerebral cortex.

#### PRESERVATION OF PROTHROMBIN IN DRIED PLASMA

MAX M. STRUMIA, M.D., BRYN MAWR, PA.

Loss of prothrombin in plasma dried from the frozen state and restored with sterile distilled water has been previously pointed out.<sup>1</sup> It has been suggested that prothrombin may be lost in the process of drying because of the loss of carbon dioxide, with resultant increased alkalinity of the plasma when it is restored with distilled water. Whereas the  $pH$  of fresh citrated plasma varies between 7.4 and 7.7, the alkalinity of plasma restored with distilled water from the dried state varies from a  $pH$  of 8.2 to 9.3. My associates and I found that the preservation of prothrombin is good up to a  $pH$  of 7.7 and very poor with a  $pH$  of 8.2 and higher. Thus the average content of prothrombin of plasma regenerated from the dried state with distilled water is from 15 to 20 per cent of normal.

If the regeneration is accomplished with cold distilled water saturated with carbon dioxide, the prothrombin in the resulting plasma solution averages between 50 and 60 per cent of normal when the original content was up to 80 per cent of normal. This method, however, is not convenient for practical use.

We have found it difficult to buffer the sodium citrate solution used for the collection of blood but have found that the use of a diluted solution of citric acid in place of distilled water for the regeneration offers a practical solution to the maintenance of a lower  $pH$  and the preservation of prothrombin in the dried plasma. The following experiment is typical. Plasma from pool 113-A, separated from citrated blood two days after collection, showed in the fresh liquid specimen a  $pH$  of 7.4 and a prothrombin content which in several determinations varied from 65 to 70 per cent of normal. Lot *a* (300 cc) was dried from the frozen state to a residual moisture of 0.8 per cent in less than seventy-two hours. Lot *b* was similarly dried, and the residual moisture was 0.7 per cent. Both specimens were contained in standard 400 cc bottles.<sup>2</sup> Lot *a* was regenerated with 250 cc of distilled water. Complete solution occurred in eighty-two seconds, including the time consumed by the introduction of the distilled water. The resulting solution had a turbidity of 280 (nephelometric reading with photoelectric colorimeter with filter 66), a  $pH$  of 8.5 and a prothrombin content of 20 per cent of normal. Specimen *c* was regenerated with 250 cc of 0.1 per cent citric acid solution. It was completely dissolved in seventy seconds, including the time taken for the introduction of the solution of citric acid, and had a turbidity of 300, a  $pH$  of 7.85 and a prothrombin content of 67 per cent of normal (average of several determinations). The citric acid solution was sterilized at 120°C in the steam sterilizer for fifteen minutes in lots of 250 cc contained in the standard 400 cc bottle.

The intravenous administration to patients of dried plasma regenerated with 0.1 per cent citric acid solution has not given rise to reactions.

#### CONCLUSIONS

Excessive alkalinity of plasma regenerated from the dried state can be avoided and a good prothrombin content maintained by regeneration with 0.1 per cent citric acid solution instead of the customary distilled water.

unless the physician directs otherwise." Since interstate shipments of this preparation are subject to the Federal Caustic Poison Act, not only should the label contain the name of the caustic substance, but the word "Poison" must be stated on the label together with directions for treatment in case of accidental personal injury

### COLOR FILMS IN FIRST AID TRAINING

Humble and Means<sup>1</sup> describe what appears to be a novel and interesting method of illustrating first aid treatment of wounds—by color films. To attain realism they resorted to simulating wounds. Brachial or femoral hemorrhage was produced for example by means of a small syringe, rubber tubing and ammoniacal carmine solution. The valve of the syringe dips into a bottle reservoir at the side of the patient, and the tubing, fixed to the nozzle of the syringe, is led around the body to a desired point in the limb, the end of the rubber tubing being embedded in the simulated wound. Arterial bleeding is imitated by causing the patient to squeeze the bulb of the syringe in time with the cardiac rhythm. The patient's face is "made up" to suggest profound shock. He is taught to act his part. The effect is so realistic that several medical men have been unable to differentiate the simulated wounds from real ones, and it is said that about 1 per cent of the audiences fainted. The authors have reproduced simple lacerations, burns, compound fractures, arterial hemorrhage and the like. They also staged and filmed a mock air raid incident in which trapped and wounded casualties were liberated from heavy debris and treated first by street methods and ultimately in a first aid post. The films have been shown at first aid posts and to wardens, firemen, army units, the first aid personnel of business firms and the general public. The practical and instructional value of these films is self evident.

### "PATENT MEDICINE" SHOWS

Physicians have noted rather blatant claims in present day "patent medicine" advertising on the radio. Protection of the public against such nostrums has increased greatly since the time when the ancient vender went from town to town with a horse and wagon, accompanied by an old Indian chief and a banjo player and carrying a stock of "cure-alls." Advertising beyond the package—that is, newspaper, magazine and radio advertising—did not receive the special consideration of any federal agency until the enactment of the Wheeler-Lea Amendment to the Federal Trade Commission Act. A clause in that particular act reads "The term 'false advertisement' means an advertisement, other than labeling, which is misleading in a material respect, and in determining whether any advertisement is misleading, there shall be taken into account (among other things) representations made or suggested by statement, word, design, device, sound, or any combination thereof." This includes, no doubt, statements that are made via radio. Following the enactment of this legislation an

attempt was made by some promoters to avoid direct statements of a misleading character by adding a qualifying word or phrase. This makes little, if any, difference in the impression created when such words are hurriedly read by the announcer. Such phrases as "in the absence of an organic trouble, this will build your blood back to normal," "acts to prevent," "we believe it reduces," "perhaps your kidneys are to blame" and "should give you soothing relief" are seldom carefully analyzed by the vast majority of listeners. The radio stations over which such material is being broadcast will become interested in the misleading nature of the copy. Their programs are subject to review by the Federal Communications Commission every six months in connection with the reissuance of their licenses.

### COSMETICS AND THE LAW

The following item appears in the Information Digest for April 2, 1942, issued by the Office of Government Reports at Washington, D. C.

#### HEALTH AND WELFARE

The Food and Drug Administration, since enactment of the Food, Drug and Cosmetic Act of 1938, has seized more than 300 consignments of cosmetics containing potentially dangerous ingredients, Federal Security Administrator McNutt announced. Articles such as sight-destroying eyelash dyes, harmful skin bleach creams, lipsticks and a highly injurious permanent waving solution were taken. Mr. McNutt said the law has brought "a marked improvement in the safety of cosmetics now on the market."

The information calls attention to the fact that some manufacturers seem to be motivated entirely by the desire for profit and without regard for the welfare of the consumer. Especially reprehensible is the promotion of products for enhancing beauty which have such vicious results as the destruction of eyesight. The cosmetic industry is now undergoing experiences similar to those encountered by the drug industry in the years following the enactment of the first comprehensive piece of legislation definitely affecting them—the Food and Drugs Act of 1906 as amended. Some concerns in the cosmetic field are following closely in the footsteps of those pharmaceutical concerns which in 1906 instituted the reforms which led to their development as ethical concerns. Those houses were encouraged in their efforts by the work of the Council on Pharmacy and Chemistry in that field. Similarly, the consideration for the acceptance of advertising in the publications of the American Medical Association of cosmetic preparations which the manufacturers submit with adequate information as to the suitability of the formula and with limitation of claims to honest statements may serve to encourage the further development of ethical cosmetic concerns. Needless to say, some others will continue to flout, evade and violate the provisions dealing with cosmetics in the legislation mentioned. The vast majority of cosmetic preparations on the American market are safe to use. Those who market cosmetic preparations without sufficient scientific study to establish safety should be ready to accept the fullest penalty that the laws provide.

# MEDICINE AND THE WAR

*In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medicine and the war, and such other information and announcements as will be useful to the medical profession*

## THE PROCUREMENT OF PHYSICIANS

A Statement for The Journal of the American Medical Association

PAUL V McNUTT  
Washington, D C

On June 8 I described to the American Medical Association at its Atlantic City meeting the acute need for physicians for the military services. I pointed out how far the recruitment of physicians lagged behind expected quotas. In conclusion I stated bluntly the fact, which could not have been evaded by any analysis, that unless voluntary recruitment progressed more rapidly some more rigorous form of selective service must be resorted to.

Those facts were necessary in order to permit the medical profession to diagnose its own case. And the case is urgent, physicians are members of what is probably the most indispensable of all professions. Despite the harshness of the facts and the bluntness with which I had to state them, I felt that the profession should be informed.

In fairness to the recruitment record of many of our states, it seems in order at this time to give the profession some further idea of how its problem is distributed. The failure of a sufficient number of physicians to volunteer for military service is not spread thinly over the whole country. There is an acute lag in certain populous states. Other states have supplied nearly all that they should supply.

We need more than twenty thousand additional physicians by the end of this year. But eight states—New York, Illinois, California, Pennsylvania, Massachusetts, New Jersey, Michigan and Ohio—should account for nearly sixteen thousand of that shortage.

By contrast, sixteen states have fewer than a hundred physicians to go to reach the total number they should supply. In order not to deplete unduly available medical service in those areas, we are asking that the Medical Officers Recruiting Boards be withdrawn and that further enlistments from those areas be then discouraged except in the case of the men under 37 in the urban areas. Those states are Alabama, Arizona, Delaware, Idaho, Louisiana, Mississippi, Montana,

Nevada, New Mexico, North Dakota, South Carolina, South Dakota, Utah, Vermont, Wyoming and Virginia.

The acute problem for the next few months for those states is an equitable distribution of medical service within their borders. This will avoid the necessity for any consideration of plans to allocate doctors from other states to meet civilian needs.

More than one hundred and thirty thousand physicians have returned their registration forms to the Roster for Scientific and Technical Personnel. Those forms are now being processed. When that work is complete we shall be able to give the profession a more comprehensive report on the relation of available medical service to wartime needs.

The seriousness of the deficit in the number of physicians available for armed forces should not be underestimated. The need must be met. It will be met by one method or another. Neither must we underestimate the serious drain this puts on available medical services in civilian communities. It will mean long hours and hard work—sacrifices which will multiply the deep debt that every community owes to its physicians.

It cannot be met simply by multiplying the hours of the physicians who are left. There will be a real need to exercise every possible means for minimizing unnecessary medical services in order that the real needs may be met.

It is my belief that the lag in recruitment has been due chiefly to the fact that the individual physician has not realized the genuine urgency of the need. Measures must be taken which will bring those home to every individual. This means that there will have to be some education of the general public. Preventable illness must be reduced to a minimum. Unreasonable demands on the physician's time must be reduced to a minimum. Thus only max available medical service adequately cover the needs.

## PROVISIONS OF THE AMERICAN RED CROSS FOR THE CARE OF CASUALTIES CAUSED BY ENEMY ACTION

At the request of the Surgeon Generals of the Army and Navy the American Red Cross and the Division of Medical Sciences of the National Research Council have organized and are conducting a joint undertaking to procure from voluntary donors large amounts of human blood to be processed into dried blood plasma to be used for transfusions. It was agreed that this plasma is to be available not only for a military emergency but also for civilian catastrophes for which blood transfusions may be indicated.

The organization known as the Red Cross Blood Donor Service is the only official agency for recruiting blood donors for the armed forces and for the U S Office of Civilian Defense. It has established blood donor centers in eighteen of our larger cities that are conveniently near the laboratories producing dried blood plasma for the armed forces. About four hundred thousand donations of blood had been procured by the service up to June 15, and plasma is being processed and released to the Army and Navy as rapidly as pos-

sible This project is being carried on at an accelerating rate

At present the available plasma by no means adequately meets the requirements of the armed forces, which at such a time must have first call on all our efforts to assist in their care and support. However, large amounts of human blood plasma are being produced, and the Surgeon General's Office of the Army, acting for itself and the Navy, is cooperating with the Red Cross as far as present conditions allow for the protection of the civilian population.

Army Regulations No. 500-60, issued Dec. 1, 1939, govern the War Department activities in connection with disaster relief. These regulations recognize the responsibility for the relief of suffering in case of disaster placed on the American National Red Cross in its congressional charter of Jan. 5, 1905 and establish the methods of cooperation between the United States Army and the Red Cross. These regulations set forth a mechanism by which the Red Cross may call on the Army for supplies and medicines whenever disaster or catastrophes demanding such assistance may occur. This relationship has recently been confirmed by the Surgeon General as applying to the supply of dried blood plasma that may be available in this country in case of a catastrophe among the civilian population. It may be said, therefore, that the supply of dried human plasma held by the Army in this country may be called on by the Red Cross for civilian catastrophes in which blood transfusions may be indicated.

Because of the fact that up to the present time the Army and Navy are not maintaining a large supply of plasma in this country, the Surgeon General's Office of the Army has allowed the Red Cross to procure a supply of dried plasma from that being processed for the armed forces. This supply is being held by the Disaster Relief Service of the Red Cross in a number of its chapters in so-called target areas, and, as the available amount of plasma increases, these depots are being backed up by larger amounts at strategic points. It is thus planned to have on hand a supply of plasma that may be used during the first few hours of a catastrophe and a larger supply not far away that can be called on immediately. This plan of distribution has been determined in conjunction with the Medical Division of the United States Office of Civilian Defense, and the plasma is to be released immediately by the

Red Cross to an authorized representative of the Medical Emergency Service of the Office of Civilian Defense in any locality where enemy action has caused casualties.

Other measures for civilian protection have been taken by the Red Cross. As the Blood Donor Service has supplied blood to the laboratories somewhat faster than they have been able to complete the drying process at the beginning of their operations, a large number of units are being held in the frozen state. The Army and the Red Cross have agreed to release a large supply of frozen plasma on the Pacific Coast to the Surgeon General of the U. S. Public Health Service from the processing laboratory there, which will be available for civilian protection through cooperation with the Office of Civilian Defense. Frozen plasma in other laboratories may also be made available for civilian protection.

The Red Cross Blood Donor Service is also procuring blood directly for the Office of Civilian Defense, which plans to have 50,000 units of dried plasma processed in a laboratory that is not being used for military purposes. The service has arranged that its highly trained bleeding teams, of which there are about forty in the blood donor centers, shall be on call at all times as blood procurement teams in case of catastrophe. These teams consist of a doctor, four graduate nurses, a secretary and one or two men helpers. The whole blood that may be on hand in the refrigerators of any blood donor center when a catastrophe occurs will be available to hospitals for transfusion purposes if needed.

Blood donor centers are located in Boston, New York, Brooklyn, Philadelphia, Baltimore, Washington, Pittsburgh, Rochester, Buffalo, Cincinnati, Cleveland, Indianapolis, St. Louis, Chicago, Detroit, Milwaukee, San Francisco and Los Angeles.

These facilities of the American Red Cross for providing blood for transfusions of civilians that may be injured by enemy action indicate that, if and when enemy attacks on the civilian population occur, a transfusion service will be available. These facilities are being gradually expanded and supplemented by the developments sponsored and directed by the Office of Civilian Defense, to which the Red Cross has given full cooperation.

As the supplies of plasma of the armed forces increase in this country, the amount available to the Red Cross in case of civilian catastrophes will be further reassuring.

### COURSES ON CHEMICAL DECONTAMINATION PROBLEMS

Starting June 29 and again on July 13, four day courses on chemical decontamination problems will be given at the Massachusetts State College, Amherst, Mass. Registration will be limited to fifty for each of the courses, which are sponsored by the Massachusetts State College, the Massachusetts Department of Public Health and the Massachusetts Committee on Public Safety in cooperation with the United States Office of Education, with the object of training chemists and bacteriologists in methods of contamination detection and decontamination of water supplies, foods and areas so that municipalities may have competent technical advisers to the local committees on public safety. The major portion of the course will comprise work in the laboratories and field demonstrations. Applications for registration, which may be made to any local civilian defense headquarters, will be accepted from citizens of the United States who have completed an approved four year college course, majoring in chemistry or bacteriology, plus two years of professional experience, or six years of equivalent

professional experience. Rooms will be provided for three nights in dormitories at Massachusetts State College, and meals will be served at the college dining hall. The total cost of rooms and meals will be \$8 per person.

### DEGASSING STATIONS IN SAN FRANCISCO

San Francisco has the most comprehensive program for gas protection of any large community in the United States. Col. George Baehr, chief of medical division of the Office of Civilian Defense, is reported to have said the latter part of May on a tour of inspection of the degassing station at San Francisco Hospital. According to the San Francisco Chronicle of May 26 the board of supervisors of the city authorized forty-one degassing stations throughout the city and appropriated a total of \$689,564 for civilian defense. The chairman of the Red Cross gas committee, Dr. M. L. Tainter, has prepared a plan which would provide for a degassing unit for each square mile of San Francisco, and at an estimated cost would be, it was said, remarkably low.

## MOBILE UNIT OF CHICAGO BLOOD DONOR SERVICE

The Chicago chapter of the American Red Cross placed in operation, June 8 a mobile unit for the collection of blood from donors. Certain requirements must be filled by the local community requesting the mobile unit, and the facilities must be inspected and approved by a representative of the blood donor service of the American Red Cross before a definite date can be arranged. There must be a minimum of 100 persons over 18 and under 60 years of age who weigh 120 pounds or more and who are in good health. The local facilities must provide a clean, well ventilated space adequate for (1) a reception room to accommodate about 16 persons, (2) a room to accommodate ten cots with a sink with running water, (3) a smaller adjoining room or additional space which may be curtained off to be used as a recovery room, (4) a room with adjoining kitchen facilities which may be used as a canteen, (5) conveniently located toilets.

For the present, the mobile unit will not be sent outside of the area covered by the Chicago chapter of the American Red Cross which includes Cook and Du Page counties and the southern half of Lake County, Ill.

## MANY JUNE GRADUATES ENTER MILITARY SERVICES

The annual national survey of colleges, technical schools, other than military academies and theological seminaries, and universities in the United States made by the Investors Syndicate indicates that 50 per cent of all the male graduates in June from one hundred and fifty-six leading institutions would join the Army, Navy or Marine Corps after commencement. Of another group of sixty-six schools more than 25 per cent of the graduates were to enter the military services, while of a third group of one hundred schools less than 25 per cent of the graduates were to enter the military services.

Among the non-war positions offered to graduates, the profession of teaching received two out of every five 'mentions,' while secretarial work ranked second to teaching in non-war employment opportunities, being cited in one seventh of the mentions.

The survey indicated that less than 3 per cent of the June graduates would enter such fields as medicine, chemistry, nursing, laboratory research, banking, selling, social work, home economics, accounting and clerical work.

## MEDICAL AND SURGICAL RELIEF COMMITTEE

The Medical and Surgical Relief Committee, a nonprofit relief organization organized in 1940, is composed of physicians, surgeons and dentists throughout the United States who have volunteered their assistance. Since the United States went to war the policy of the committee has been to concentrate its efforts on relief in the United States. Up to June 4 the committee had supplied one hundred and eighty-six emergency medical field units to hospitals and casualty stations throughout the country. Now the committee intends also to distribute emergency medical field units to whatever country our own fighting forces are sent.

The committee has its headquarters at 420 Lexington Avenue, New York City where it functions under a permit under the department of state (No 357). A report is filed with the department of state every month and the accounts are audited quarterly by certified public accountants. The committee is dependent on public contributions for its support. Its medical and surgical supplies are obtained from the medical profession which contributes used and obsolete surgical instruments, food supplies and pharmaceuticals. The instruments are reconditioned and then distributed. The committee which is constantly sending canned foods and pharmaceutical products to welfare agencies has recently sent a large amount of milk products to be distributed to the undernourished children of Tennessee, Georgia and the Carolinas. The committee recently donated 23 cases of dental instruments and supplies to Dr. Gordon Agnew, professor of dental surgery in West China University of whom word has been received of his safe arrival

in China with these supplies. Many foot dental drills which had been donated by the committee of dentists throughout the country will be found useful in districts where there is no electricity.

During May supplies valued at \$10,240.64 were furnished needy hospitals, first aid posts, emergency medical services and other relief agencies in the United States and allied nations. The shipments included 41 emergency medical field sets, 11 cases of assorted instruments, 31 cases of medical supplies, and concentrated foods.

## CIVILIAN DEFENSE

The Cambria County (Pa.) commissioners have purchased thousands of dollars' worth of medical supplies for the health committee of the Johnstown Defense Council and these have been recently distributed among the mobile units.

At a conference in Duluth, May 11, Major Paul Swan of St. Paul, of the Minnesota Defense Force said that the state serum laboratory has prepared a reserve of serum which will be distributed to key points in Minnesota and northern Wisconsin for use in emergencies, the serum will be distributed under the direction of the Minnesota adjutant general. At this meeting the coordination of the medical phases of civilian defense in northeastern Minnesota and northwestern Wisconsin were discussed by Dr. Frank J. Elias of Duluth, chairman of the ninth councilor district of the Minnesota State Medical Association and Dr. Wallace D. Hunt of the seventh corps defense region and officials from Minnesota and Wisconsin.

## COURSE ON MEDICAL ASPECTS OF CHEMICAL WARFARE

The second five day course on medical aspects of chemical warfare was conducted on April 20-24 by the Medical Division of the Office of Civilian Defense in cooperation with the University of Cincinnati College of Medicine and the assistance of the Chemical Warfare Service, Edgewood Arsenal, Maryland. The thirty-six physicians who attended the course were addressed, among others by Drs. James H. Bennett, Marion A. Blankenhorn, Albert L. Brown, R. H. Broh-Kahn, Howard D. Fabing, Leon Goldman, Robert A. Kehoe, Milan A. Logan, Willard M. Machle, Arthur Mirsky, Vinton E. Siler and Mr. George Hermann.

Similar courses were presented in the Western states at Los Angeles, June 5-7, Palo Alto, May 29-31 and Seattle, June 12-14. A group of instructors is thus being trained who will conduct institutes for physicians in their own communities in cooperation with the state and local medical societies and the state and local defense councils.

## EMPTY VACOLITERS GIVEN TO ARMY AND NAVY IN HONOLULU

Since the raid on Pearl Harbor, Hospital Purveyors, Ltd. has issued more than 8,000 empty vacoliters free of charge to the army and navy and the several hospitals in and about Honolulu and these hospitals have been permitted to retain the empty containers since they use the contents for intravenous injections. The vacoliters are the property of the Baxter Laboratories of Glendale, Calif., and in normal times are returned to the laboratory for refilling. Mr. Emery S. Beardsley, president of Don Baxter Incorporated has authorized the manager of Hospital Purveyors to continue donating these containers as long as they may be of use to the community. Each empty vacoliter is valued at thirteen cents.

## AIR RAID CASUALTY STATIONS

Los Angeles County, Calif. now has an air raid casualty station available for every 10,000 of population. Dr. W. L. Halverson, county health officer, reports. He says there is a total of one hundred and eighty stations, 53 per cent of them fully equipped and the remainder partially equipped. The lack of equipment at some stations is not serious as equipment from nearby stations can be easily transferred.

PAN AMERICAN DELEGATES TO THE NINETY THIRD ANNUAL SESSION OF THE AMERICAN MEDICAL ASSOCIATION ATLANTIC CITY JUNE 8 12 AMONG THOSE INCLUDED IN THIS PICTURE, TAKEN AT THE RECEPTION TO THE VISITORS BY THE BOARD OF TRUSTEES AND THE COUNCIL ON SCIENTIFIC ASSEMBLY ARE DR AND MRS FRED W RANKIN LEXINGTON KY DR FRANCO SEDASIAO VIEIRA BRAZIL DR JOSE RODRIGUEZ PASTOR PUERTO RICO DR OLIN WEST CHICAGO DR JAMES E PAULLIN ATLANTA GA DR MORRIS FISHBEIN CHICAGO DR AND MRS RAIMUNDO DE CASTRO CUBA DR AND MRS ELVIRA REY CHILIA CUBA DR AND MRS ALEJANDRO LIPSCHUTZ CHILE DR HUGH S CUMMING WASHINGTON D C DR AND MRS VICTOR CASTRO CUBA DR AND MRS JORGE CAVELIER COLOMBIA DR B SEPULVEDA MEXICO DR VICENTE S TOYOS GOMEZ CUBA DR DARIO VERA GONZALEZ PARAGUAY MISS MARTA DE LINNIN VENEZUELA DR ANCELO LOBO MACHADO BRAZIL DR ENRIQUE KOPPISCH PUERTO RICO DR IGNACIO CHAVEZ MEXICO DR JOSE B GOMEZ ARGENTINA DR AQUILES DR CARLOS M QUINTEROS ARGENTINA DR JOAS JACQUES DORNELLES BRAZIL DR RUTILIO ALAMILLA GUTIERREZ MEXICO DR FREDERICO VAN DOMSELAAR ARGENTINA DR RENE BARON ARGENTINA DR ENRIQUE JOSE CERVANTES NEW YORK DR RUY GOYANNA BRAZIL DR RAUL ALCAYAGA ARGENTINA DR PINOCHET MOREIRA CHILE DR MANUEL ROCA GARCIA COLOMBIA

# ORGANIZATION SECTION

## PROCEEDINGS OF THE ATLANTIC CITY SESSION

MINUTES OF THE NINETY-THIRD ANNUAL SESSION OF THE AMERICAN MEDICAL ASSOCIATION, HELD IN ATLANTIC CITY, JUNE 8-12, 1942

### HOUSE OF DELEGATES

#### *Second Meeting—Tuesday Morning, June 9*

The House of Delegates was called to order at 9 35 a m by the Speaker, Dr H H Shoulders

#### Roll Call and Presentation of Minutes

On motion of Dr William R Brooksher, Arkansas, seconded by Dr James Q Graves, Louisiana and carried, the House dispensed with the roll call and with the reading of the minutes

#### Report of Reference Committee on Credentials

Dr J Newton Hunsberger, Chairman, reported that one hundred and sixty-three members of the House of Delegates had been registered, that there are one hundred and seventy-five members of the House in all, but that there are two from the Philippine Medical Association who cannot be here, one from the Hawaiian Territorial Medical Association and several others who cannot be in attendance

#### Presentation and Address of Surgeon General James C Magee

Dr Fred Rankin President-Elect, presented the distinguished Surgeon General of the United States Army, Major General James C Magee, who addressed the House as follows

*Colonel Rankin, Dr Shoulders, Gentlemen* I had the privilege of appearing before this body two years ago at the beginning of the present military emergency I am very happy now to have the opportunity of repeating that experience I have no intention of making a speech because I think the points of view of my office have already been fully explained by Colonel Lull who I understand has explained our position in detail I do want, however, to make clear to you all my very deep sense of appreciation of the efforts expended by this House and by the medical societies that it represents in the furtherance of the medical effort in the present war We all know that we are having lots of difficulties, but they have not been insurmountable, and whatever those may be that are now facing us, I am quite sure that they will be ironed out This is probably America's largest medical military effort It must go through and I am quite sure it will go through Meanwhile, I would like to say a word further I believe in the last two years that we have witnessed a type of medical service for the American soldier that has never been excelled by any nation I believe I can safely say that no soldier has gone without proper medical care or succor He has been skilfully treated, he has been skilfully treated because the character of men in organized medicine in America is superior to any And if we continue in the future as we have in the past, I believe the American medical profession will add to its laurels I am very happy to be here and I will not detain you longer

#### Report of Reference Committee on Medical Education

Dr Walter G Phippen Chairman presented the following report, which on motions duly made, seconded and carried, was adopted section by section and as a whole

1 Request that American Medical Association inspect and Approve or Disapprove Present and Future Schools for Train-

ing of Medical Record Librarians Your reference committee considered the request presented by Dr W A Coventry, Minnesota on behalf of the American Association of Medical Record Librarians, and duly heard its proponents and members of the Council on Medical Education and Hospitals This request is that the American Medical Association undertake the standardization, inspection, approval and listing of schools for the training of medical record librarians Your reference committee believes that this is a proper function of organized medicine and that the need of such standardization is imperative Your reference committee believes that this undertaking should properly be carried out by the Council on Medical Education and Hospitals, but that since it involves the expenditure of funds your reference committee recommends that the standardization, inspection approval and listing of schools for the training of medical record librarians be referred to the Board of Trustees

2 Report of Council on Medical Education and Hospitals on Demise of Dr William D Cutler Your reference committee has reviewed the report of the Council on Medical Education and Hospitals and notes with sorrow and with approval the statement on the demise of Dr William D Cutler and moves the adoption of that statement

3 Report of Council on Medical Education and Hospitals on Programs for Accelerated Curriculums and for the Medical Student Your reference committee agrees with the wisdom of the Council on Medical Education and Hospitals in recommending the policy of local self determination by individual medical schools in adopting a program for accelerated curriculums It commends the Council on Medical Education and Hospitals for the part that it played in working out a program for the medical student vis-a-vis his military obligations and for its study and consideration of these situations caused by depletion of interns, residents and faculty members

4 Appendix to Report of Council on Medical Education and Hospitals Your reference committee has reviewed the appendix to the report of the Council on Medical Education and Hospitals entitled "Essentials of an Approved Internship" and recommends that the first sentence in paragraph one of section seven entitled Radiology be changed to read as follows "This department should be equipped with suitable shockproof apparatus" With this small change your reference committee recommends the adoption of "Essentials of an Approved Internship as presented in the appendix of the report of the Council

5 Outline of "Essentials of an Acceptable School for Clinical Laboratory Technicians" Your reference committee recommends at the request of the Council on Medical Education and Hospitals that the outline of "Essentials of an Acceptable School for Clinical Laboratory Technicians" adopted in its revised form June 4, 1941 be amended by the introduction of the words 'approved medical schools' in chapter one, paragraph one so that its first sentence reads as follows "Acceptable schools for training laboratory technicians may be conducted by approved medical schools general hospitals, or state health laboratories affiliated with hospitals where the majority of the student's practical training is received"

Respectfully submitted

WALTER G PHIPPEN, Chairman  
JAMES R MILLER  
EDWARD H SKINNER  
A W ADSON  
I J MENVILLE

### Report of Reference Committee on Hygiene and Public Health

Dr Felix J Underwood, Chairman, presented the following report

1 Resolution Expressing Appreciation of American Medical Association for Friendly Cooperation of the Broadcasting Companies Your reference committee approves the resolution presented by the Board of Trustees to the effect that a copy of its resolution expressing the appreciation of the American Medical Association for their friendly cooperation be transmitted by the Bureau of Health Education to the broadcasting companies

2 Report of Board of Trustees Dealing With Work of Bureau of Health Education Your reference committee warmly approves the work being done by the Bureau of Health Education in every way, but more particularly in the matter of its radio series Doctors At Work, which has now been in production over two years and which, in itself, is a development of eight years of effort The trustees might well consider the expenditure of funds for the further development of this type of program

3 Report of Committee to Study Problems of Motor Vehicle Accidents Your reference committee approves the report and commends the Red Cross and other agencies which have interested themselves in first aid Attention is called to the fact that first aid manuals are written by physicians and that first aid teaching is initially done by physicians and that the cooperation lies in their willingness to render the service and the willingness of the agencies concerned to accept it

4 Resolution on Control of Venereal Disease Your reference committee approves of the resolution in principle The committee is not in a position to adjudicate the ethics of the situation, but it is convinced that the practice brought out by the resolution is detrimental to the efforts for reducing the incidence of venereal disease

Respectfully submitted,

FELIX J UNDERWOOD, Chairman  
W F DRAPER  
HOLMAN TAYLOR  
ROBERT L ANDERSON  
F S CROCKETT

On motions duly made, seconded and carried, the first three sections of the report of the reference committee were adopted

Dr Underwood moved the adoption of the fourth section of the report referring to the Resolution on Control of Venereal Disease Dr Arthur T McCormick, Kentucky, moved as a substitute that the House adopt the resolution as presented This motion was seconded, and after discussion by Drs Thomas A McGoldrick, New York, R W Fouts, Vice Speaker, A T McCormack, Kentucky, Clyde L Cummer, Section on Dermatology and Syphilology, and Holman Taylor, Texas, it was moved by Dr Clyde L Cummer, Section on Dermatology and Syphilology, that this section of the report be rereferred to the reference committee for revision, and the motion was seconded by Dr Arthur J Bedell, Section on Ophthalmology, Dr McCormack withdrawing his motion The motion to rerefer this section of the report to the reference committee was adopted

On motion of Dr Underwood, seconded by Dr A T McCormack, Kentucky, and carried, the report was adopted as a whole with the exception of the fourth section, which was rereferred to the reference committee

### Report of Reference Committee on Amendments to the Constitution and By-Laws

Dr Walter E Vest, Chairman, presented the following report

1 Resolutions Requesting Change in By-Laws Limiting Time for Introduction of New Business in House of Delegates Your reference committee has considered the resolutions presented by the State Medical Society of Wisconsin proposing that all resolutions introduced by delegations from the constituent associations be presented to the Secretary of the American Medical Association sixty days in advance of the annual session and referred by the Secretary to the state secretaries and the individual delegates to the American Medical Association

It is the opinion of your reference committee that the principle embodied in this resolution is sound but that the adoption of the proposed amendment to the By-Laws would prove impractical, in that it would necessitate that resolutions adopted by state associations within the proposed sixty day period lay over until the second annual session of the American Medical Association's House of Delegates subsequent to their adoption by the state associations Your reference committee recommends that the resolutions introduced by the State Medical Society of Wisconsin be not adopted

Your reference committee recommends to the constituent state associations, however, that the principles involved be followed and that resolutions adopted by state associations intended for presentation to the House of Delegates of the American Medical Association be presented to its Secretary promptly after adoption by such state associations and that such resolutions as are received in time be published in the number of THE JOURNAL containing reports of officers

2 Report of Judicial Council on Amendment to Constitution Relative to Composition of House of Delegates Your reference committee has carefully considered that portion of the report of the Judicial Council referred to it for consideration, that is the recommendation that the Constitution, article 5, section 2, be amended to make delegates elected by the sections of the Scientific Assembly ex officio delegates without the right to vote

It is the opinion of your committee that the Constitution should not be so amended because (1) a large number of the members of the American Medical Association are now in government service and are therefore unlikely to wield influence on their representatives in this House of Delegates and (2) the adoption of such an amendment might tend toward the classification of the American Medical Association as a business league rather than as it is now classified, namely, as a scientific body Your reference committee therefore recommends that the reapportionment of 1943 be made under the existing constitutional provisions

3 Proposed Amendment to Constitution Relative to Number of Trustees Your reference committee has given careful consideration to the proposed amendment to the Constitution presented to the House of Delegates at the Cleveland session in 1941, and it is its opinion that this proposed amendment should not be adopted

The Board of Trustees as at present constituted seems to have discharged its varied and important duties in a highly efficient manner, leaving no reason to believe that numerical expansion of the Board would increase its efficiency

Respectfully submitted,

WALTER E VEST, Chairman  
WALTER F DONALDSON  
KARL S J HOHLEN  
EDWARD M PALIETTE SR  
WILLIAM WESTON

The first section of the report of the reference committee was adopted on motion of Dr Vest, seconded by Dr William R Brooksher, Arkansas, and carried after discussion by Drs T K Gruber, Michigan, Arthur J Bedell, Section on Ophthalmology, and Dr Vest

No action was taken on the second section of the report of the reference committee, since the Speaker ruled that the subject matter therein contained had been referred to the Reference Committee on Sections and Section Work

The recommendation of the reference committee contained in the third section of the report was adopted by rising vote on motion of Dr Vest, seconded by Dr A T McCormack, Kentucky, and carried after discussion by Drs Edward H Cullen, Texas, Thomas S Cullen, Maryland, William R Molony Sr, California, Edward H Skinner, Section on Radiology, John Brown, Utah, William Weston, Section on Pediatrics, John H Fitzgibbon, Oregon, Walter B Martin, Virginia, A T McCormack, Kentucky, Olm West, Secretary, and Dr Vest

On motion of Dr Vest, seconded by Dr A T McCormack, Kentucky, and carried, the report of the reference committee with the exception of the second section on which no action was taken, was adopted as a whole

### Report of Reference Committee on Reports of Officers

Dr Deering G Smith, Chairman, presented the following report which on motions duly made, seconded and carried, was adopted section by section and as a whole

1 Address of Speaker Your reference committee appreciates the leadership of the Speaker in the efforts of this House of Delegates to preserve the "American way of life" He has made a keen analysis of the present situation and your reference committee agrees with him that the record of the medical profession is "altogether sufficient to give to the American people, to soldiers and to the mothers and fathers of soldiers, the highest form and the fullest measure of assurance as to what you and the profession you represent can be depended on to do today, tomorrow and until victory has been won"

2 Address of the President Dr Lahey has been a militant leader of our Association during these troublesome times, and his work as Chairman of the Board of Procurement and Assignment Service has been outstanding Your reference committee approves of his preparedness and war efforts, which took precedence over the usual presidential duties He has taken every opportunity to try to make the public and the medical profession conscious of the seriousness of the war In spite of his efforts and the efforts of others, it is apparent that the country is still not aware of the urgency of the situation Your reference committee expects that you, as leaders of the medical profession, will assist Dr Lahey in preaching this gospel "that optimism is one of the things which can lead to our downfall"

3 Address of the President-Elect It is very fitting and indeed remarkable that our President-Elect should also hold a high position in the Army of our country In his address, he has shown deep insight into the many problems now confronting the medical profession Your reference committee believes that the physicians appreciate the privilege of having been accorded a voice in the allocation of medical personnel in the war program and recommends that we stand back of the Procurement and Assignment Service It agrees with Dr Rankin that this is a young man's war but that the old men left at home will have to do work of equal importance and believes that the standards of medical education, including internship, should be kept at as high a level as is consistent with the war effort Every attempt should be made to conserve the teaching facilities including even essential younger men, so that the supply of well trained physicians shall be maintained Your reference committee concurs in the necessity for the curtailment of the postgraduate education of specialists The principles of this curtailment have been stated clearly in the address of the President-Elect The suggestion of Dr Rankin that meetings for the postgraduate education of the general practitioner, with programs featuring intensive instruction by competent teachers with the elimination of discussions, be sponsored by this Association seems to be admirable Your reference committee recommends that this proposal be referred to the Board of Trustees for study

Respectfully submitted,

DEERING G SMITH, Chairman  
EDWARD C PODVIN  
THOMAS A PITTS  
J H IRWIN  
MEREDITH MALLORY

### Report of Reference Committee on Reports of Board of Trustees and Secretary

Dr L H Bauer, Chairman, presented the following report, which on motions of Dr Bauer, duly seconded and carried was adopted section by section and as a whole

#### REPORT OF SECRETARY

Membership and Fellowship Your reference committee notes with satisfaction the steady increase in membership and Fellowship in the Association It seems to the committee that the increases are an indication of a steadily mounting feeling among physicians of the importance of being associated with organized medicine

Secretaries' Conference The Secretaries' Conference held annually is an excellent additional means of coordinating all state activities with those of the national body and these conferences should be continued

War Activities These will be discussed in detail by another committee and are referred to only for sake of completeness and to invite the attention of the House to the fact that a tremendous strain has been thrown on the Secretary's Office by the necessity of carrying on these war activities

Submission of Memorials and Resolutions The matter of requiring all memorials and resolutions for the House of Delegates to be submitted in advance so that they may be printed prior to the session is a good idea in theory but not practicable of execution As a resolution pertaining to this specific matter has been introduced and referred to another committee for action, this committee makes no recommendation about it

Suspension of Dues for Military Service This is a matter of information and requires no action other than education of the members It does not seem to be clearly understood that no member as such pays any dues whatever to the American Medical Association His membership is contingent on his being a member in good standing in his county or district society, and of the dues which he pays to his county and state societies not one cent accrues to the American Medical Association Only Fellows pay dues, and these dues are largely in payment of the publications to which they may subscribe Therefore it seems to your reference committee that not only is it a fact that Fellowship dues cannot be suspended or remitted without amendment of the Constitution and By-Laws but also that there is no reason to suspend or remit them The heavy load of dues is usually in the state and county assessments, and these organizations can take such action as they deem fit In fact, many of them already have arranged for revision of dues for those in the military services The subscriptions to the publications of the American Medical Association also furnish a means whereby the doctor in military service may keep abreast of the changes in general medicine pending the time he may return to private practice Hence it does not seem to your committee that it is advisable to recommend amendment of the Constitution and By-Laws to provide for the remission of dues of Fellows who are in the military service

Service of the Secretary The committee notes that this year completes twenty years of service of Olin West as Secretary of the American Medical Association He extends his thanks and appreciation as usual to all those with whom he has had contact It seems to the committee that it is high time for the House of Delegates to pay tribute to Olin West One familiar with organized medicine can hardly think of the American Medical Association without thinking of Olin West, and the converse is equally true Your reference committee therefore recommends that the House extend its felicitation and thanks to Dr West and its hope that he will continue to serve us as Secretary for many years to come

#### REPORT OF BOARD OF TRUSTEES

The report of the Board of Trustees contains, as usual, a wealth of material which it behooves every member of the House to study Specifically, your reference committee invites your attention to the following

1 Income and Expenditures It is comforting to note that gross income, income from Fellowship dues and subscriptions and income from advertising were all greater for 1941 than for 1940 However, not too much optimism should prevail, as costs are going up and income from Fellowship dues may decrease as the result of many Fellows entering the military service and not keeping up their Fellowships, and advertising is likely to fall off as the result of the restrictions on certain commodities Increases are bound to occur also in wages and salaries, not only because of possible wage increases, but also because of additional personnel necessary to handle war activities The maintenance of the Councils bureaus and committees was about \$22,000 less for 1941 than for 1940 This probably will not occur again A new building for storage purposes had to be constructed This cost will probably be nearly \$215,000, but this is an expense that will not occur again for many years at least The Board of Trustees states that it is effecting economies wherever such economies will not interfere with efficient operation It is a noteworthy fact which accounts probably in no small measure for the efficiency of the Association that

many of the employees have been in its employ for fifteen to thirty-five years. This speaks for the employer-employee relationship of the Association.

2 **THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION** Your reference committee notes with approval the action of the Trustees in dividing *THE JOURNAL* into three volumes a year instead of two. The program of medicine and war is approved. It is noted that the increase in subscribers to *THE JOURNAL* is steadily increasing, but there are still some states with less than 50 per cent of their physicians receiving it.

3 **Special Journals** Two of these journals showed a loss in the number of subscribers, all the others an increase. Two of them show an increase in income over the cost of publication. There is still a loss incurred in the publication of these journals as a whole, but it is gratifying to note that last year the loss was over \$18,000 less than for the preceding year. These journals fill a useful, even necessary, place, and their publication should be continued even though they are operated at a loss.

4 **WAR MEDICINE** This journal has had a remarkable reception and it is filling a necessary place in medical publications. It is noted that the Division of Medical Sciences of the National Research Council wishes it to be published monthly. The matter of when and if this is to be done should be left to the Board of Trustees.

5 **HYGEIA** *HYGEIA* had the largest subscription of any year of its existence through the efforts of the auxiliaries. It has been placed in a considerable number of schools, hospitals and reading rooms of women's clubs and other organizations. *HYGEIA* serves a useful purpose in educating the public in the principles of health and the aims of the American medical profession in improving the health of the general public. Effort should be made by the state and county societies to extend the distribution of this magazine.

6 **Press Relations** The attention of those who have criticized the American Medical Association on its press relations is invited to the report of the Board of Trustees on this particular subject. More than eighty-one thousand stories were published in the daily press of the United States in 1941, all this in addition to a large number of feature stories and editorials. During the last annual session, more space in the local newspapers was given to the news of the session than in any previous session. Over thirty-one hundred inquiries have been received from newspapers and radio stations, which indicates that the Association is considered an authority on medical matters, as indeed it should be. The scope of the material issued covers practically the field of medicine. Your reference committee feels that the press relations activities of the Association should be commended and that effort should be made to continue these activities along the same lines.

7 **Library** The use of the library is constantly increasing and, it is believed, would be even more extensively used if its services and facilities were more widely understood.

8 **QUARTERLY CUMULATIVE INDEX MEDICUS** This is a most valuable publication. It is unfortunate that the war has interrupted exchange relations with many foreign periodicals and prevented the receipt of many others. Nothing can be done about it, however, and possibly some of the material can be indexed for historical purposes at a later date.

9 **American Medical Directory** Your reference committee feels that this publication does not receive the publicity which it should. It is rather amazing that only about seventy-three hundred copies are distributed. This is an important reference book, and its value to hospitals, medical boards and county medical societies should be emphasized.

10 **Cooperative Medical Advertising Bureau** This Bureau continues to carry on its efficient activities and is of material assistance to many state journals.

11 **Mailing and Order Department** This requires no comment except to note the tremendous volume of mail passing through the Association's office.

12 **Council on Pharmacy and Chemistry** The Council has continued its useful and satisfactory relations with various governmental agencies. In the field of new drugs the Council

has been concerned with developments in sulfonamide therapy and in developments in the vitamin field. The Council has issued many reports and publications as in previous years. The work of the Council is approved and it is urged to keep a close watch on the development of vitamin therapy and to deprecate the tendency of certain commercial organizations to further "shot gun" vitamin therapy. The whole field of vitamin therapy should be clarified in order that therapeutic indications may be thoroughly understood. It should also continue to clarify the nomenclature in the production of new drugs and to discourage the use of multiple names for the same drug.

13 **Council on Physical Therapy** The work of the Council on Physical Therapy is very diversified and the attention of the House is invited to the report of its work as stated in the report of the Board of Trustees. The work of the Council is commended and it is urged to use every effort to keep control of physical therapy in the hands of a responsible medical profession and not allow it to become a commercial football.

14 **Council on Foods and Nutrition** This Council has been also largely concerned with the subject of vitamins, and the same recommendations are made to it as have just been made to the Council on Pharmacy and Chemistry. It is noted that the Council is gradually limiting its scope to devote more attention to those products which are most important from a health point of view. Your reference committee recommends approval of this trend. Steps should also be taken by the profession at large to educate the public on the purpose of the certification of foods, as the public very largely misunderstands the ideals and aims of the Association in such certification.

15 **Chemical Laboratory and Tests and Standards** The Laboratory is now in its thirty-sixth year and has been a most useful adjunct to the Council on Pharmacy and Chemistry. Both the Laboratory and the Council on Pharmacy and Chemistry suffered severely in the loss of the secretary, Dr. Paul Nicholas Leech, and the member Dr. C. W. Edmunds. The Laboratory has carried out tests on many new therapeutic agents. Seventy-two substances have been examined in addition to the various dosage forms of other products. The Laboratory has cooperated with various other organizations. The Association may well be proud of the record of the Laboratory.

16 **Council on Industrial Health** The work being done by this Council has great potentialities for service during the present emergency. There is industrial mobilization during this war as well as military mobilization. The Council feels that the physicians in community practice must be prepared to provide industrial health services in medium size and small plants and that a high degree of organization will be necessary to meet the medical requirements of wartime industrial production. Education of industrialists is essential if the advantages of medical supervision over workers is to be accepted. The Council recommends that an agency for public information preferably attached to the Subcommittee on Industrial Health and Medicine, should undertake this educational activity. The Council wisely points out that failure to encourage a voluntary program may lead to some compulsory form of medical supervision. Your reference committee therefore recommends that such an agency be set up in accordance with the recommendations of the Council. The Procurement and Assignment Service has a part to play in this industrial mobilization just as it does in military mobilization, and the Council is cooperating fully with that agency. This agency also may serve as a source of information to employers needing medical personnel. The Council reports further progress on a Dictionary of Industrial Health which is a compilation and standardization of nomenclature of industrial health. Steps have been taken by the Council to help remedy the deficiency in industrial medical education, particularly in undergraduate teaching. Health education has been recognized as a proper function of industrial practice. Attention is invited to the necessity of improving the character of the membership in cooperating committees. Industrial health in state societies and down into the local societies. The sections of the Scientific Assembly have contributed help in various problems through the creation of advisory committees. Cooperation has been intimate with other agencies of the American Medical Association in the preparation of reports and in the development of

health activities. Interest has been maintained in industrial nursing, and there are prospects of the promotion of the professional status of the industrial nurse under proper supervision. The Council is also cooperating with lay agencies in investigating and arranging for appraising established industrial medical services. The Council is also preparing an outline of principles for use in preemployment and periodic physical examinations. Occupational disease reporting is important if progress is to be made. State societies can assist in making possible the collection of such statistics. The Council has in the formation stage a program for clarifying the atmosphere on workmen's compensation and the publishing of useful data which will be of value not only to physicians but to others concerned with the subject. A committee has been appointed to carry out this program. All these actions of the Council should, in the opinion of your reference committee, be approved by the House and the various studies and programs should be continued. Aside from the work connected with actual war medicine, there is no factor which will contribute so much to the war effort as industrial health.

17 Bureau of Medical Economics. While matters pertaining to the war were referred to another committee, we cannot discuss the Bureau of Medical Economics without considering the war, as most of its activities for the past year were in the field of medical preparedness. The survey of medical personnel made by the Bureau was a marvelous piece of work. Nothing equal to it has ever been accomplished before. Despite the excellent work of the Bureau, the work could not have been done so completely and thoroughly without the wholehearted cooperation of state and county societies, to all of which the Association owes thanks. Thanks are also due to the Army and Navy for their complete cooperation. Continuous revision of the census keeps it up to date. Various special lists have been compiled of practically all necessary and useful classifications of physicians. Such lists are of inestimable benefit to the Procurement and Assignment Service. The latter service was created in October 1941, and a consultant office was established in Chicago with the head of the Bureau of Medical Economics, Dr Leland, as supervisor. This has all been a tremendous amount of work, reflecting great credit on the Bureau of Medical Economics and, in the opinion of your reference committee, the medical profession is greatly in the Bureau's debt. The Bureau has also compiled an index and digest of official actions of the House of Delegates, which will be a continuing publication and will be most useful to every one concerned with the work of organized medicine and in particular to future reference committees of this House. The work of the Bureau of Medical Economics with reference to medical service plans and the program of the Farm Security Administration will form the subject of a supplemental report by your reference committee.

18 Bureau of Investigation. This Bureau continues to be a most useful factor in the educational activities of the Association. Ten thousand inquiries were submitted to the Bureau during the past year, which gives an idea of the magnitude of the work. The Bureau is being used in an ever increasing way by teachers, news agencies and Better Business Bureaus. It has also cooperated with government agencies.

19 Bureau of Exhibits. There is no question that the Scientific Exhibit at the Cleveland session was the finest on record, and great credit is due the Bureau for it. Exhibits are also available for loan purposes and are increasing in number and educational value. Health exhibits are being lent to museums and assist in health education. Motion pictures are also available for loan.

20 Committee on American Health Resorts. The committee has prepared rules for the listing of acceptable health resorts which have been approved by the Board of Trustees. These rules are carefully drawn and will doubtless prove of value in classifying health resorts and protecting the public against unwarranted therapeutic claims and against institutions with inadequate or improper medical supervision.

21 Committee to Study Air Conditioning. The committee is continually appraising developments and publications relative to air conditioning and public health. It has compiled a large

amount of information which is available on request, and occasional publications are issued. The work of the committee should be continued.

22 Proposed Committee to Confer with the Specialty Boards. Because of constantly changing conditions due to the war and changes going on in the specialty boards, the Board of Trustees decided that now was an inexpedient time to appoint committees suggested a year ago. Approval of the action of the Board of Trustees is recommended by the reference committee.

Respectfully submitted,

LOUIS H. BAUER, Chairman  
A. R. McCOMAS  
J. F. HASSIG  
WILLIAM R. MOLONY SR.  
PARKE G. SMITH

#### Report of Reference Committee on Miscellaneous Business

Dr Charles G. Strickland, Chairman, presented the following report, which on motions of Dr Strickland, duly seconded and carried, was adopted section by section and as a whole.

1 Resolution on Preserving Progressive Techniques in Medical Practice. This resolution was given a new title in a committee conference with Dr Cary, and certain paragraphs in the preamble were eliminated in the interests of clarity. With these changes your committee recommends the passage of the resolution, which now reads as follows:

##### POSTWAR MEDICAL PLANNING

WHEREAS The conditions under which physicians have been able to function in the United States provide the factor most nearly responsible for the relatively enviable position which medicine now occupies and which is enabling organized medicine to provide the personnel and professional competence that represent an essential, even vital contribution to the war effort; and

WHEREAS It is a chief responsibility of the profession to do its utmost to continue progressive methods in medical service which will provide opportunity for those physicians who are called to military service to reenter private practice under conditions which will insure continued progress and maximum effectiveness in civilian service; therefore be it

Resolved That we the House of Delegates of the American Medical Association place ourselves officially on record as recognizing our responsibility for making the utmost effort to preserve the elements of independence and freedom of action that will make possible the easy reentry of physicians to civilian practice. To this end we recommend that a definite part of each program of every component member medical society be devoted to a reconsideration of the traditions, the standards, the freedoms and the effects of the absence of restraints and outside controls which have contributed so materially to American medicine's unequalled progress and vast achievements.

2 Resolution Requesting Approval of Principles of American College of Apothecaries. Your reference committee sympathizes with and approves of the high ideals mentioned in the preamble of this resolution requesting endorsement of the American College of Apothecaries and it deplors the encroachment of commercialism on the old line pharmacy. It is, however, unable to recommend the passage of the suggested resolution, which to a certain extent commits the American Medical Association as sponsors of an organization outside our immediate profession.

3 Resolutions on Hospital Corporations Engaging in Practice of Medicine. While these resolutions were given careful consideration, your reference committee was informed by Dr E. H. Skinner, Section on Radiology, that somewhat similar resolutions would be introduced today by the California delegation. Dr Skinner asked us to defer action and to consider the resolutions together.

4 Resolution on Tribute to Physicians and Surgeons of Honolulu County Medical Society. Your reference committee recommends the resolution for approval.

5 Resolutions on Elimination of Requirement of Certification of Checks for Purchase of Special Tax Stamps in Connection with Dispensing of Opium. Your reference committee recommends these resolutions to the House of Delegates for approval.

6 Resolutions Requesting Change in By-Laws Limiting Time for Introduction of New Business in House of Delegates. Your reference committee believes that the present methods of handling new business are fair and equitable. It does not believe the suggested change with the requirements that resolutions shall be filed with the Secretary sixty days in advance

of the annual session is feasible or desirable. It might mention that several state societies hold their annual sessions less than sixty days before the American Medical Association session and it recommends the defeat of these resolutions.

7 Resolutions on Standards for Percentage Determination of Hearing Loss. On page 69 of the American Medical Association Handbook your reference committee notes that the Council on Physical Therapy reports progress on this subject and promises a definite report in the near future. No data were furnished that this final report had been made. The standing of the Council on Physical Therapy, however, is such that your reference committee unhesitatingly recommends the approval of the standards set when, as and if set.

Respectfully submitted,

CHARLES G. STRICKLAND, Chairman  
JOHN T. DONOVAN  
H. C. MACATEE  
ANDREW F. MCBRIDE  
J. H. FITZGIBBON

### Report of Reference Committee on Legislation and Public Relations

Dr. E. S. Hamilton, Chairman, presented the following report, which was adopted section by section and as a whole on motions of Dr. Hamilton, duly seconded and carried.

1 Resolution on Aid to Our Government. Your reference committee recommends that this resolution be passed.

2 Report of Board of Trustees Relative to Meetings with Hospital Associations. Your reference committee recommends that the request of the Board of Trustees for additional opportunity for the Bureau of Medical Economics to study this problem be granted.

3 Resolution on Appreciation to Broadcasting Companies. Your reference committee recommends that this resolution be adopted.

4 Report of Bureau of Legal Medicine and Legislation. Your reference committee wishes to commend most heartily the report of the Bureau of Legal Medicine and Legislation in content, showing, as it does, a large amount of study and statistical work with regard to legislation all over the United States. It especially commends that portion of the report which concerns the safeguarding of accounts of deceased physicians from excessive taxation. It also commends the continued vigilance with regard to attempts to extend the scope of activity of non-medical practitioners in the various states of the nation. It is not in sympathy with the use of osteopaths as interns in Army hospitals and commends the War Department for the opposition to such legislation. It commends the bringing to the attention of the medical profession the proposed broadening of the base of the Social Security Act to include employees now excluded and to grant additional benefits of employees now covered by the act, as this appears to be an encroachment of socialized medicine, and it recommends the adoption of the report as presented by the Bureau of Legal Medicine and Legislation.

Respectfully submitted,

E. S. HAMILTON, Chairman  
DON F. CAMERON  
STEPHEN E. GAVIN  
HENRY A. LUCE  
CARL R. STEINKE

### Report of Reference Committee on Hygiene and Public Health

Dr. Felix J. Underwood, Chairman, presented the following report, which was adopted on motion of Dr. Underwood, seconded by Dr. A. T. McCormack, Kentucky, and carried.

Resolution on Control of Venereal Disease. Your reference committee is completely in accord with the provisions of this resolution and recommends its adoption. It is inconceivable that any reputable physician should so degrade his profession and himself as to issue certificates to prostitutes to the effect that they are free from venereal disease. This is a baneful practice which encourages the maintenance of vice and may do incalculable damage by giving false assurance of safety and lead to an appreciable increase in venereal disease. Moreover, it tends

to nullify the efforts of the duly constituted authorities, federal, state and local, to deal with the problems of prostitution by law enforcement and other accepted methods. Your reference committee wishes only that it were gifted with the power of expression to emphasize more strongly its approval of the spirit and intent of the provisions of this resolution.

Respectfully submitted,

FELIX J. UNDERWOOD, Chairman  
W. F. DRAPER  
HOLMAN TAYLOR  
ROBERT L. ANDERSON  
F. S. CROCKETT

### NEW BUSINESS

#### Resolutions on Rebates

Dr. Dwight L. Wilbur, California, submitted the following resolutions, which were referred to the Reference Committee on Amendments to the Constitution and By-Laws, with which the Judicial Council will sit.

WHEREAS, The Principles of Medical Ethics of the American Medical Association in chapter III, article I, section I, states that "The obligation assumed on entering the profession demands that he use every honorable means to uphold the dignity and honor of his vocation, to evaluate his standards," and

WHEREAS, Section 5 of the same chapter and article states that "It is unprofessional to receive remuneration from patents or copyrights on surgical instruments, appliances, medicines, foods, methods or procedures. It is equally unprofessional by ownership or control of patent or copyrights either to retard or to inhibit research or to restrict the benefit to patients or to the public to be derived therefrom. It is unprofessional to accept rebates on prescriptions or appliances or perquisites from attendants who aid in the care of patients," and

WHEREAS, Article VI, section 4, of this chapter states that "When a patient is referred by one physician to another for consultation or for treatment, whether the physician in charge accompanies the patient or not, it is unethical to give or receive a commission by whatever term it may be called or by any guise or pretext whatsoever," and

WHEREAS, Section 5 of this same article and chapter states that "It is unprofessional for a physician to dispose of his professional attainments or services to any lay body, organization, group or individual, by whatever name called, or however organized, under terms or conditions which permit a direct profit from the fees, salary or compensation received to accrue to the lay body, or individual employing him. Such a procedure is beneath the dignity of professional practice, is unfair competition with the profession at large, is harmful alike to the profession of medicine and to the welfare of the people, and is against sound public policy and

WHEREAS, Recent articles in magazines of wide national circulation have called attention to shady practices of secret rebates to physicians and

WHEREAS, Commercial concerns and laboratories by the employment of cappers and steerers and by secret rebating are largely responsible for these criticisms, and

WHEREAS, The Better Business Bureau has complained of practices in which secret rebates were offered or accepted by physicians, and

WHEREAS, The dishonest acts of a few may be reflected to the discredit of the many, now, therefore be it

Resolved, That it be declared unethical for the members of the American Medical Association or its component branches to refer patients to commercial organizations, laboratories or other physicians who advertise to the public and others than the medical profession who employ steerers or cappers or who offer to pay rebates or commissions in any other manner violate the Principles of Medical Ethics of the American Medical Association or its component branches, and be it further

Resolved, That any physician violating these resolutions be subject to whatever disciplinary action is deemed advisable by the county society of which he is a member.

#### Proposed Amendments to the By-Laws

Dr. John Andrew, Colorado, presented the following proposed amendments to the By-Laws, which were referred to the Reference Committee on Amendments to the Constitution and By-Laws.

1 Amend chapter XII, section 6, of the By-Laws to read as follows:

SEC. 6. ASSOCIATE FELLOWS.—The following may be elected in accordance with section 5 chapter IV, to Associate Fellowship physicians who are members of the chartered national medical societies of countries adjacent to the United States, American physicians in foreign countries and engaged in medical missionary and educational and philanthropic labors, dentists holding the DDS who are members of state or local dental societies who are active members of the American Pharmaceutical Association secretaries and executive secretaries of constituent societies and societies who are not eligible for membership as physicians representative teachers and students of science allied to medicine in the United States and not eligible to regular membership. Associate Fellows shall enjoy the same privileges as regular Fellows as to subject to the same conditions.

2 Amend chapter IV, section 5, of the By-Laws to read as follows

**SEC 5 ASSOCIATE FELLOWS**—Applications for Associate Fellowship from foreign physicians, from American physicians engaged in missionary and similar labors in foreign countries and from secretaries and executive secretaries of constituent associations and component societies who are not eligible for membership as physicians must be approved by the Judicial Council, applications from dentists must be approved by the Section on Laryngology, Otolaryngology and Rhinology, from pharmacists by the Section on Pharmacology and Therapeutics and from representative teachers and students of science allied to medicine by the officers of a section

#### Resolution on Safeguarding Women in Industry

Dr Jean Paul Pratt, Section on Obstetrics and Gynecology, presented the following resolution, which was referred to the Reference Committee on Hygiene and Public Health

**WHEREAS** There have been repeated assertions in the press and elsewhere that American industry in its all out war effort will be obliged to depend more and more on women employees as replacements for able bodied men essential to the armed forces and

**WHEREAS** The rate of absenteeism in industry due to sickness is considerably larger for women than men and

**WHEREAS** In addition to specific health problems relating to pregnancy, menstruation, venereal disease and the proper custody of dependent small children, certain conditions of work and unhealthful exposures more seriously affect the health of women than male workers and

**WHEREAS** Various agencies in the government in industry and in labor are greatly interested in the health as well as the legal and economic status of women workers, he it

**Resolved** That the Council on Industrial Health take these matters promptly under advisement with such help as can readily be secured from the Section on Obstetrics and Gynecology in order that the practicing profession, industrial physicians and obstetricians/gynecologists be informed about the best methods of safeguarding the physical well being of women in industry

#### Resolution Urging Civilians to Seek Medical Advice While Sufficient Doctors Remain Available

Dr Stanley H Osborn, Section on Preventive and Industrial Medicine and Public Health, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business

**WHEREAS** It is well known that many individuals with chronic diseases of one type or another who expect to seek medical advice or who have been advised by their physicians to have treatment and

**WHEREAS** The early symptoms of many diseases are mild in character and many persons postpone seeking medical advice or the patients postpone treatment recommended by the physician and

**WHEREAS** Many thousands of physicians have gone into the armed services of the country and tens of thousands of doctors will soon be commissioned and gone to war in the future, therefore he it

**Resolved** That this body recommend that all persons who expect to seek medical opinion or who have had medical or surgical care prescribed for them should seek medical advice or follow such advice while sufficient doctors remain available to the civil population

#### Resolution on Message from Mr Paul V McNutt

Dr Charles H Henninger, Pennsylvania, presented the following resolution which was referred to the Reference Committee on Military Preparedness

**WHEREAS** There has come to this House of Delegates a message directly from the chief of the War Man Power Commission, Mr Paul V McNutt, indicating the needs of the nation in this great emergency for the services of the physicians of our country and

**WHEREAS** The American medical profession has never failed in any previous emergency to meet the needs of the armed forces of our country for medical officers and

**WHEREAS** The Procurement and Assignment Service for Physicians, Dentists and Veterinarians was established by the President of the United States to enable the medical profession to meet all the demands placed on it to provide medical officers for all the governmental services for industry and for our civilian population, therefore he it

**Resolved** By the House of Delegates of the American Medical Association that we tender to Mr Paul V McNutt our appreciation of his message and of his cooperation that we pledge to the President of the United States to the War Man Power Commission and to the Procurement and Assignment Service every aid that this organization can possibly render in meeting this objective and that the Board of Trustees and the War Participation Committee of the American Medical Association be requested to give consideration to all of the means by which these objectives may be attained

#### Resolutions on Improvement of Relations Between Physicians and Insurance Companies

Dr Lyell C Kinney, California, presented the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations meeting jointly with the Reference Committee on Miscellaneous Business

**WHEREAS** It is desirable that physicians and insurance companies cooperate to the fullest extent especially in the interest of persons covered by health and accident insurance and

**WHEREAS** A serious situation has arisen in the administration of certain health and hospitalization schemes whereby medical services are being billed under the term 'hospital services' and are being paid for by insurance companies as they are labeled hospital services and

**WHEREAS** The continuation or extension of such practices will inevitably lead to the inclusion of any type of medical service under the label 'hospital service' at the convenience of the corporations involved and to the detriment of medical care now, therefore he it

**Resolved** That the House of Delegates of the American Medical Association hereby requests insurance companies to cooperate with the organized medical profession to the end that hospitalization policies shall include only hospital benefits. If the inclusion of indemnification for medical services such as surgery or radiology is desired, then payment of such shall be made only on receipt of certified statement from a physician that he has rendered such. Fees for medical services should be paid to physicians via indemnity to the assured or by check payable jointly to assured and physician. This practice should be maintained irrespective of whether a hospital chooses to bill for medical services as a part of its hospital bill and be it further

**Resolved** That the House of Delegates of the American Medical Association requests hospitals and physicians to cooperate with it in this important step by seeing that bills for hospital and medical services are clearly distinguished, the latter should bear the name of the physician rendering the service to indicate clearly that the charge is for medical service

#### Resolutions on a Program for Refresher Training in General Clinical Medicine

Dr B J Hein, Ohio, presented the following resolutions, which were referred to the Reference Committee on Medical Education

**WHEREAS** At the conclusion of hostilities many young medical officers who will return to civilian practice will need refresher training in general clinical medicine, he it

**Resolved** That the Board of Trustees of the American Medical Association instruct the Council on Medical Education and Hospitals to develop a program for such training in conjunction with the various medical schools and constituent state medical societies and be it

**Resolved** That the Board of Trustees confer with the proper government authorities as to the possibilities of granting a furlough with full pay and allowance to medical officers desiring to take advantage of such refresher courses

Dr R W Fouts, Vice Speaker, at the request of the Speaker read a report of the Reference Committee on Reports of Officers at the 1930 annual session dealing with Executive Sessions of the House

The meeting recessed at 12 25 p m

### Tuesday Afternoon, June 9

The House of Delegates was called to order by the Speaker at 2 o'clock

On motion of Dr Walter E Vest, West Virginia, duly seconded and carried, attendance at the Executive Session was granted to members of the House of Delegates, alternate members of the House of Delegates, officers, Trustees and persons allied to the administrative affairs of the American Medical Association, presidents, secretaries, executive secretaries, chairmen of councils and editors of constituent state and territorial medical associations, secretaries and executive secretaries of component county medical societies, the secretary of the Southern Medical Association, the secretary of the American College of Physicians, Dr Benvenuto R Diño of the Philippine Islands, visitors from the Army and Navy, and Dr Thomas Parran, Surgeon General of the United States Public Health Service

### Executive Session—Tuesday Afternoon, June 9

The Sergeants-at-Arms polled the House, after which the House went into Executive Session at 2 15, with Dr H H Shoulders, Speaker, presiding

#### Report of Reference Committee on Executive Session

Dr Thomas A McGoldrick, Chairman, presented the following report which was adopted on motion of Dr McGoldrick, seconded by Dr A T McCormack, Kentucky, and carried

The following resolution has been presented by title and referred to your reference committee

#### RESOLUTION REQUESTING CHANGE IN SOCIAL SECURITY ACT

**WHEREAS** Under the Social Security Act payments for medical care given to recipients of aid from the blind, old age and dependent children's divisions of the Department of Social Welfare can no longer be made to physicians directly but instead these payments must be made to the patient and

WHEREAS, Experience in New York City has shown that this method of payment has worked a hardship on the physicians who have rendered medical care to these persons by forcing them to make one or more additional calls to collect their bills, and

WHEREAS, In New York City it has been proved that nearly 5 per cent of these patients have not paid their doctors for medical care rendered with the money which the State Department of Social Welfare gave them but instead have spent the money for other uses, and

WHEREAS, The New York City Department of Welfare has stated that this percentage is only a fraction of the number of patients who did not pay their physicians for medical care, as shown by the great many complaints from physicians who have telephoned to that department, rather than written letters which could be submitted in evidence, and

WHEREAS, The Medical Society of the State of New York requests the American Medical Association to take steps looking to a change, therefore be it

*Resolved*, That the American Medical Association consider having legislation initiated to provide a change in the Social Security Act so that persons rendering medical care to recipients of aid from any government agency may be paid directly by that agency

Owing to the lack of information on this practice throughout the United States and in the absence of any reasons for approval presented to your reference committee, it recommends that the resolution itself be not approved

Respectfully submitted,

THOMAS A. MCGOLDRICK, Chairman  
LUCIUS F. DONOHUE  
R. E. SCHLUETER  
WALTER W. KING  
LLOYD NOLAND  
E. H. CARY  
CLYDE L. CUMMER

#### Report of Reference Committee on Military Preparedness

Dr. John H. O'Shea, Chairman, presented the following report

1 Resolution on Women Physicians Obtaining Commissions in Medical Reserve Corps of United States Army and Navy. A similar resolution was presented at the 1941 session of this House. Your reference committee, in consideration of this resolution, is not unmindful of the splendid work of the eight thousand women physicians of this country. Their position in the field of medicine in America is unquestionably established. The nation is, however, now at war, with the whole responsibility for its successful prosecution resting with our armed forces. Your reference committee, after hearing discussions which included statements from representatives of both the Army and the Navy, concluded that this is a problem involving technical and administrative considerations wholly within the province of the Surgeon Generals of the Army and the Navy. Any recommendations from this body would be presumptive interference with those agencies responsible for the successful prosecution of the war. Your reference committee therefore recommends that this resolution be disapproved.

2 Report of Committee on Medical Preparedness and Report of Board of Trustees Dealing with Medicine and the War. These reports were considered together. They both deal with the formation and activities of the Committee on Medical Preparedness and the development of the Procurement and Assignment Service. It is gratifying to note the present cordial relationship existing between the government and the medical profession. The report of the Committee on Medical Preparedness again demonstrates the efficiency of organization of the American Medical Association and its willingness to serve to the limits of its capacity. The response of the individual physician to the call for voluntary duty in the prosecution of the Selective Service effort reveals no depreciation of the historic spirit of our American physicians.

The Committee on Medical Preparedness concludes its report with two specific recommendations

(a) The first is that, since its original objectives have been attained, this committee should be now discharged. Your reference committee recommends that this be done and that the Committee on Medical Preparedness be commended for its splendid accomplishments. The untiring efforts and personal sacrifices of the members of the Committee on Medical Preparedness deserve much greater recognition than is indicated in the all too modest tone of its report.

(b) The second recommendation is that a new committee be named to be known as the Committee on Participation of the Medical Profession in the War Effort. Your reference committee recommends that a committee of five members be appointed by the Speaker of the House, with the President, President-Elect, Chairman of the Board of Trustees, Secretary of the Association and the Editor of THE JOURNAL as ex officio members. Your reference committee felt however that, for purposes of brevity, some further consideration should be given to the proposed title of this committee. It submits for consideration as an alternative the name of "War Participation Committee of the American Medical Association."

Respectfully submitted,

JOHN H. O'SHEA, Chairman  
FRANCIS F. BORZELL  
WILLIAM D. JOHNSON  
S. E. THOMPSON  
GEORGE F. LULL  
HAROLD W. SMITH  
CHARLES H. PHIFER

Dr. O'Shea moved the adoption of the first section of the report, recommending disapproval of the Resolution on Women Physicians Obtaining Commissions in Medical Reserve Corps of United States Army and Navy. The motion was seconded by Dr. Robert E. Schlueter, Missouri, and carried after discussion by Dr. Emily D. Barringer, New York.

Section 2 (a) of the report of the reference committee, dealing with the report of the Board of Trustees and with the report of the Committee on Medical Preparedness, was adopted on motion of Dr. O'Shea, seconded by Dr. John Z. Brown, Utah, and carried.

Dr. O'Shea moved that section 2 (b) of the report of the reference committee, recommending the appointment of a "War Participation Committee of the American Medical Association" be adopted, and the motion was seconded by Dr. A. T. McCormack, Kentucky, and carried.

The report of the reference committee was adopted as a whole on motion of Dr. O'Shea, seconded by Dr. William R. Brooks, Arkansas, and carried.

#### Report of Reference Committee on Legislation and Public Relations

Dr. E. S. Hamilton, Chairman, read the following majority report

Resolutions on Approval of Activities of National Physicians' Committee for the Extension of Medical Services. Your reference committee, after considerable discussion of these resolutions by several members of the Board of Trustees and by a number of others interested, believes that the following modified resolution expresses more nearly the attitude of the American Medical Association.

WHEREAS, The American physicians and the American Medical Association have been placed in a most favorable light before the American public by the activities of outside groups of individual physicians assisted by business firms, entirely independent of organized medicine, therefore be it

*Recommended*, That the House of Delegates of the American Medical Association hereby express gratitude and deep appreciation for the outstanding service rendered its members and its official organization by these groups.

Respectfully submitted,

E. S. HAMILTON, Chairman  
DON F. CAMERON  
CARL R. STEINFELT

Dr. H. A. Luce, Michigan, presented the following minority report on these resolutions.

This minority report is an unqualified endorsement of the resolutions as introduced.

Respectfully submitted,

HENRY A. LUCE  
STEPHEN E. GAYLOR

Dr. Hamilton moved the adoption of the majority report of the reference committee, and the motion was seconded by Dr. A. T. McCormack, Kentucky.

Dr Luce moved the adoption of the minority report of the reference committee, and the motion was seconded by Dr Clarence G Brindler, New York, and there was discussion by Drs Thomas A McGoldrick, New York, Francis J Savage, Minnesota, E H Cary and Holman Taylor, Texas, E S Hamilton, Illinois, R W Gouts, Vice Speaker Roger I Lee, Acting Chairman of the Board of Trustees, Henry C Macatee, District of Columbia, James R Bloss, member of the Board of Trustees, Charles Gordon Heyd, member of the Council on Medical Education and Hospitals, J Newton Hunsberger, Pennsylvania, Carl R Steinke, Ohio, and Louis H Bauer, New York

The minority report was approved

On motion of Dr William R Brooksher, Arkansas, seconded by Dr Thomas A McGoldrick, New York, and carried, the House rose from executive session at 3 30 p m

## Tuesday Afternoon—Continued

The House reconvened in regular session at 3 30 p m with Dr H H Shoulders, Speaker, presiding

### Presentation and Address of Dr Benvenuto R Diño

The Secretary presented Dr Benvenuto R Diño of the Philippine Islands, who addressed the House as follows

*Mr Speaker, Officers and Members of the House of Delegates* I appreciate this kind generosity that you have shown toward me, a humble member of the medical profession of the Philippines. It is a great honor to be presented before this distinguished audience the cream and the flower of American medicine. I do not feel that you are giving this honor to me personally, but I do feel that this is another evidence of your recognition of the gallant stand taken by the Filipino people, soldiers and civilians and physicians alike, side by side with their American comrades in the preservation of American ideals the American way of life in our defense of that great American flag

*Mr Speaker*, you know the conditions prevailing now in my country. The Philippine Medical Association could not send delegates to this convention. I am of the conviction, however, that I voice the sentiments of my colleagues in the Philippines when I say right here and now that we are grateful to the American Medical Association that we will always remember those American pioneer physicians who have introduced hygiene, sanitation, public health in my country, those American pioneer physicians responsible for our medical education. We are grateful to the government and to the people of America for praising the words of His Excellency, President Manuel Quezon of the Philippines in his address before the House of Representatives last week. 'No amount of suffering, destruction and even death can lessen our unflinching loyalty can lessen our unswerving faith in America.' Thank you

### Presentation of Dr Ludvig Hektoen

The Speaker presented to the House Dr Ludvig Hektoen, Chicago, recipient of the Distinguished Service Award, who said

*Mr Speaker and Gentlemen* Just a word of deep, heartfelt personal thanks for the great honor you have shown me. Thank you

The House recessed at 3 45 p m, to reconvene on Thursday, June 11, at 1 p m

## Third Meeting—Thursday Afternoon, June 11

The House of Delegates was called to order at 1 10 p m by the Speaker Dr H H Shoulders

### Report of Reference Committee on Credentials

Dr J Newton Hunsberger, Chairman, stated that a total of 163 delegates had been seated

### Roll Call

The Secretary called the roll and announced that more than a quorum had responded

### Presentation of Minutes

On motion of Dr William R Brooksher, Arkansas, seconded by Dr A T McCormack, Kentucky, and carried, the House dispensed with the reading of the minutes

### Report of Reference Committee on Sections and Section Work

Dr A T McCormack, Chairman, presented the following report, which was adopted on motion of Dr McCormack, seconded by Dr Walter B Martin, Virginia, and carried after discussion, but the introduction of the proposed amendment to the Constitution contained in the report lies over until next year

The Report of the Judicial Council on the Reapportionment of Delegates. Your reference committee has carefully considered this report and has instructed its chairman to offer an amendment to the Constitution, article 5, section 2, that delegates elected by the sections of the Scientific Assembly be ex officio delegates without the right to vote

Since it is necessary for this amendment to lie over until the next annual session, your reference committee also recommends the adoption of the second or alternative recommendation of the Judicial Council that, because of the number of members of the Association now in government service and therefore unlikely to wield influence on their representatives in this House of Delegates, the reapportionment in 1943 be made under the present constitutional provisions

Respectfully submitted,

A T MCCORMACK, Chairman.  
L G CHRISTIAN  
OLIN H WEAVER  
B F COOK  
ARTHUR J BEDELL

### Report of Reference Committee on Medical Education

Dr Walter G Phippen, Chairman, presented the following report, which was adopted section by section and as a whole on motions of Dr Phippen, duly seconded and carried

1 Resolutions on a Program for Refresher Training in General Clinical Medicine. (a) Your reference committee has considered these resolutions, hearing members of the Ohio delegation and members of the Council on Medical Education and Hospitals in support of them. Your reference committee feels strongly that there will surely develop a need for refresher courses for physicians returning to civilian practice, particularly among the younger group who enter military service soon after their intern training. It is evident that medicine will make many advances while these men are serving with the armed forces, and it seems only just that these physicians be given the opportunity before they reenter civilian practice to bring themselves abreast of the times. Therefore your reference committee recommends that the House of Delegates instruct the Council on Medical Education and Hospitals to develop a program of refresher courses for physicians returning to civilian practice after the war. In arranging such a program, consideration should be given to cooperation with medical schools, approved hospitals and medical societies

(b) Your reference committee also recommends that the Board of Trustees confer with the proper government authorities as to the possibility of granting a furlough with full pay and allowances to such physicians returning to civilian practice after the war as may desire to take advantage of such refresher courses

Respectfully submitted,

WALTER G PHIPPEN, Chairman  
JAMES R MILLER  
EDWARD H SKINNER  
L J MENVILLE  
A W ADSON

### Report of Reference Committee on Legislation and Public Relations

Dr E S Hamilton Chairman presented the following report, which on motions by Dr Hamilton duly seconded and carried, was adopted section by section and as a whole

1 Resolution on Medical Service Plans. Your reference committee calls attention to an apparent inaccuracy in the final paragraph in which the statement at the behest of the parent

organization" is made. It recommends that the following resolution be adopted at this time in substitution of the original resolution:

*Resolved*, That the House of Delegates of the American Medical Association approves that principle of medical service plans on a service basis when sponsored by a constituent state medical association or a component county medical society in accordance with the recommendations relative to medical service plans adopted by the House of Delegates.

Respectfully submitted,

E. S. HAMILTON, Chairman  
DON F. CAMERON  
STEPHEN E. GAVIN  
HENRY A. LUCE  
CARL R. STEINKE

2 Resolutions on Hospital Corporations Engaging in Practice of Medicine. The joint committee consisting of the Reference Committee on Miscellaneous Business and the Reference Committee on Legislation and Public Relations feels with respect to the resolutions that they introduce no new principles not already accepted by this House at former sessions and ask only definite clarification and study by the Board of Trustees. Your joint committee recommends the adoption of these resolutions.

3 Resolutions on Improvement of Relations Between Physicians and Insurance Companies. In regard to these resolutions, your joint committee feels that they involve many additional technicalities and require prolonged and delicate negotiations with insurance carriers which will be time consuming and difficult of attainment. So before committing our organization definitely to the line of action which these resolutions demand, your joint committee recommends that the resolutions be referred to the Board of Trustees for study by itself and the Bureau of Medical Economics as to the facts, feasibility of action requested and as to ways and means of accomplishing the desired results. Your joint committee does not at the present time recommend the passage of these resolutions in their present form.

Respectfully submitted,

REFERENCE COMMITTEE ON MISCELLANEOUS BUSINESS  
CHARLES G. STRICKLAND, Chairman  
JOHN T. DONOVAN  
H. C. MACATEE  
ANDREW F. MCBRIDE  
JOHN H. FITZGIBBON

REFERENCE COMMITTEE ON LEGISLATION AND PUBLIC RELATIONS  
E. S. HAMILTON, Chairman  
DON F. CAMERON  
STEPHEN E. GAVIN  
HENRY A. LUCE  
CARL R. STEINKE

4 Resolution on Adequate Medical Care. During the discussion of this resolution it was suggested by the officers of the Medical Society of New Jersey that the enabling portion of the resolution be amended to read:

*Resolved*, That the American Medical Association encourage and assist in the development of mechanics by county and state medical societies for the purpose of providing medical care for low wage groups, for the destitute and for any other groups needing assistance in obtaining medical care, and further be it

*Resolved*, That efforts be made by the several state medical societies to procure enabling legislation whereby such mechanisms can be empowered to administer for government or other responsible agencies the medical care needed by clients of governmental agencies or persons who are adjudged unable to provide such medical care for themselves.

Your reference committee wishes to commend the Medical Society of New Jersey for its laudable efforts to provide medical care for low income groups, but, as far as developing a plan or fostering legislation by the parent organization is concerned, it has been the considered judgment on many previous occasions that plans should originate in local communities, since they have separate and distinct problems and needs. It, therefore, disapproves of this resolution.

Respectfully submitted,

E. S. HAMILTON, Chairman  
DON F. CAMERON  
STEPHEN E. GAVIN  
HENRY A. LUCE  
CARL R. STEINKE

## Report of Reference Committee on Hygiene and Public Health

Dr. Felix J. Underwood, Chairman, presented the following report, which on motions of Dr. Underwood, duly seconded and carried, was adopted section by section and as a whole:

1 Resolution on Safeguarding Women in Industry. Your reference committee has given careful consideration to this resolution and has changed somewhat the phraseology of the body of the resolution. The intent remains the same but it is the belief of the committee that the objective will be better served if a change is made. Your reference committee proposes that the resolution be changed to read as follows:

*Resolved* That the Council on Industrial Health be requested to give its immediate consideration to the preparation of a directional and informative pamphlet for the guidance of physicians and allied workers concerned with the health and well being of girls and women engaged particularly in the rapidly developing war industries. This might include the steps for taking histories and for standardized examinations of female workers with special reference to their mental and physical status. In the preparation of this pamphlet, the various sections of the American Medical Association could be called on for material recommendations it found desirable.

2 Resolution Urging Civilians to Seek Medical Advice While Sufficient Doctors Remain Available. Your reference committee has given careful consideration to this resolution and is of the opinion that it would be a wise and timely action. Certain it is that as time goes on the attention of remaining physicians will have to be devoted more and more to acute and emergency cases. The sooner that persons with chronic ailments which they intend to have corrected apply for advice or treatment, the better the chances will be of receiving the attention desired.

Respectfully submitted,

FELIX J. UNDERWOOD, Chairman  
ROBERT L. ANDERSON  
F. S. CROCKETT  
W. F. DRAPER  
HOLMAN TAYLOR

## Report of Reference Committee on Amendments to the Constitution and By-Laws

Dr. Walter E. Vest, Chairman, presented the following report, which was adopted section by section and as a whole on motions of Dr. Vest, duly seconded and carried:

1 Proposed Amendments to By-Laws re Associate Fellowships. Your reference committee has carefully considered the proposed amendments to the By-Laws providing for the election of lay secretaries and executive secretaries of constituent associations or component societies to Associate Fellowship. It recognizes fully the worth of these lay secretaries to the individual organizations they serve and to organized medicine generally. Your reference committee feels further that the men and women are to be congratulated on the excellent work they are doing. The profession generally should thank them for their loyalty, their service and their accomplishments in behalf of the organized profession. It is the opinion of your reference committee, however, that such an amendment would serve no useful purpose. Those eligible under such an amendment already are allowed all the rights and privileges pertaining to Associate Fellowship and even more in that they are permitted to remain in executive sessions of the House of Delegates. It is the belief of your reference committee that a lay secretary might be at times in a less strategic position to serve his organization by such member relationship than otherwise would be the case. Moreover, careful study of chapter IV, section 5, of the By-Laws convinces your reference committee that the House of Delegates in providing for Associate Fellowship did so only on the basis of secretarial attainment. It is therefore the recommendation of your reference committee that the proposed amendments be not adopted. Your reference committee does recommend, however, that chapter IV, section 5, of the By-Laws be amended so that the "Section on Pharmacology and Therapeutics" read "Section on Experimental Medicine and Therapeutics" to conform to the present title of that section.

2 Resolutions on Rebates. Your reference committee has given very serious consideration to these resolutions. It

opinion of your reference committee that the practices referred to in the resolutions are beneath the dignity of a learned profession are basically dishonest and are a violation of the Principles of Medical Ethics. Your reference committee therefore recommends that the following substitute resolutions be adopted:

**WHEREAS** It has been brought to the attention of the House of Delegates that the unscrupulous practice of rebates to physicians is being engaged in by various commercial organizations, laboratories, supply houses and in some professional relationships between certain physicians and

**WHEREAS** All such practices are clearly in violation of the Principles of Medical Ethics, therefore be it

**Resolved** That the House of Delegates of the American Medical Association express stern disapproval of the practice by any of the members of its component societies of referring patients to commercial organizations, laboratories or other physicians who advertise to the public and others than the medical profession who employ so-called steerers or carriers or who pay or offer to pay rebates or commissions in any guise what ever or who in any other manner violate the Principles of Medical Ethics of the American Medical Association and be it further

**Resolved** That any member violating these resolutions be subject to such disciplinary action as is deemed advisable by the county society in which such physician holds membership and be it further

**Resolved** That the Secretary of the American Medical Association be instructed to send a copy of these resolutions to each state and county society accompanied by a letter to the secretary of each setting forth that all such unethical practices are disreputable and unscrupulous and if not controlled may soon bring the reputation of the entire medical profession

Respectfully submitted

WALTER E. VEST, Chairman  
WALTER F. DONALDSON  
KARL S. J. HOHLEN  
EDWARD M. PALLETTE, SR.  
WILLIAM WESTON

#### Report of Reference Committee on Reports of Board of Trustees and Secretary

Dr. Louis H. Bauer, Chairman, presented the following report which was adopted section by section and as a whole on motions of Dr. Bauer, duly seconded and carried after discussion:

1 Report of Bureau of Medical Economics in Report of Board of Trustees. Two activities of the Bureau of Medical Economics in which no comment was made in the general report of your reference committee have been held over for further discussion, and the report follows. These activities are those listed as Medical Service Plans and the program of the Farm Security Administration.

(a) Medical Service Plans. A recommendation was made a year ago that the Bureau establish some method of coordination and interchange of material pertinent to the administration of prepayment plans for medical care sponsored by medical societies. The Bureau began a study of such plans, and data are coming in. It is contemplated that the Bureau will become a clearing house for factual data pertaining to the whole subject which will be available to all state and county medical societies.

It might be well at this point to review briefly the principles already adopted by the House of Delegates in 1938. 1 Hospital service insurance was approved in principle. It was felt that these plans should confine themselves to provision of hospital facilities and should not include any type of medical care. 2 It was recognized that health needs are not identical in different localities but depend on local conditions and therefore are local problems. 3 Cash indemnity insurance plans were considered practicable of development in order to cover in whole or in part the costs of emergency or prolonged illness. Such plans were also to have approval of the county and state medical societies of their respective areas. 4 A stand was reiterated against any system of compulsory health insurance. 5 A conviction was expressed that voluntary indemnity insurance may assist many income groups to finance their sickness costs without subsidy. It was further stated that development of group hospitalization and establishment of insurance plans on the indemnity principle to cover the cost of illness would assist in the solution of these problems.

As a result of the adoption of these principles, various organizations came into being. Not only is the cash indemnity principle being used but medical service plans, some on the so-called unit plan, have also developed. Taken as a whole, progress has been slow and disappointing. It seems to your reference committee that there are two outstanding reasons for this. First, the public has not shown any great desire for such plans. Its attitude is often that it has always obtained medical care when and where it wanted it, and paid for it when and if it pleased—so why budget ahead for something it believes it can get anyway? The other reason is partly tied up with the first. The original idea of all such plans was to find some means of delivering good medical care to those in the economic group above indigence and below complete self sufficiency. This aim has to a large extent been lost sight of, and there has been a tendency to make the fee factor more important than the delivering of good medical care. One thing is certain, and that is that the development of sound, workable, voluntary plans will do more than anything else to avert the introduction of some compulsory plan.

The Bureau of Medical Economics feels that the principles already adopted by the House are sound and should be adhered to and that there is nothing to indicate that medical service organizations and group hospitalization cannot function separately as parallel services in communities that are sufficiently interested to support them. Your reference committee agrees in general but feels that certain modifications are advisable. 1 Reiteration should be given to the fact that the aim of all plans should be to facilitate delivery of the best medical service to those who are in the economic group below self sufficiency. 2 To help carry this out, approval should be given to the principle of medical service for the low income groups, provided the local situation warrants and the local county and state medical societies approve. 3 The part to be played by the American Medical Association should be restricted to the adoption of broad general principles and to acting as a clearing house, as already planned by the Bureau of Medical Economics. The idea that the American Medical Association can and should develop a plan on a countrywide basis is contrary to sound common sense. One of the claims we have always made in opposing state medicine is that medical control cannot be centralized. Conditions vary in different states and even in different counties in the same state. What will work in one locality is impracticable in another. Plans, therefore, should be largely local in character so far as details are concerned and national only so far as broad general principles are concerned.

The matter of the cash allowance of \$3 a day for hospitalization for those employed under the Social Security Act is not yet sufficiently definite for the House to take action on it. The matter should be referred to the Board of Trustees for appropriate action, if and when the matter becomes more definite.

(b) Program for Farm Security Administration. Medical care plans sponsored by the Farm Security Administration are operating in more than nine hundred counties of thirty-seven states and involve more than one hundred thousand families and more than five hundred thousand persons. The Farm Security Administration now proposes what amounts to a voluntary health insurance plan for all farm families in an average county in one or more areas and would give more complete medical care than the present Farm Security plan does, all to be worked out between the county agricultural planning committee and the county medical society. Because financial conditions have changed for the better in farm communities since the original proposition was made it is probably less urgent now. Furthermore it requires more study than can be given it during this meeting. Therefore your reference committee recommends that the matter be referred back to the Board of Trustees for study and such action as it deems fit.

Respectfully submitted

LOUIS H. BAUER, Chairman  
J. F. HASSIG  
A. R. MCCOMAS  
WILLIAM R. MOLODY, SR.  
PARKE G. SMITH

**Presentation and Address of Miss Mary Switzer,  
Assistant to Mr Paul V. McNutt**

Dr Frank H Lahey, Past President, presented Miss Mary Switzer, assistant to Mr Paul V McNutt, who spoke as follows

*Dr Lahey, Mr Speaker* I may say that I feel that I am also part of the staff of the American Medical Association since our close working relationships with Dr Lahey and his board have made us all feel that we are one body working for a very precious common objective

**NEW BUSINESS**

**Resolution Passed by the Section on Ophthalmology  
in 1941 Recommending Rescinding of Resolution  
Passed by the House of Delegates in 1935  
and Resolution Passed by Section on  
Ophthalmology in 1942 Rescinding  
1941 Resolution**

Dr Arthur J Bedell, Section on Ophthalmology, presented the following resolutions from the section, the latter resolution rescinding the former, both being tabled by the House on motion of Dr W E Kittler, Illinois, seconded by Dr Walter E Vest, West Virginia, and carried

At a meeting of the Section on Ophthalmology in executive session on June 4, 1941 it was moved by Dr A R Irvine and seconded by Dr S Judd Beach that the section recommends to the House of Delegates that the following resolutions adopted by it in 1935 be rescinded

WHEREAS, There have been many complaints regarding the action of some ophthalmologists in giving lectures to and consulting with opticians and optometrists, and

WHEREAS, It is universally conceded that to care for the diseases and conditions of the human eye demands the unusual knowledge of a graduate physician who has been especially prepared, and

WHEREAS, The eye is an integral part of the body, and

WHEREAS, No one but a physician so trained should be permitted to diagnose, treat or prescribe for eye conditions, and

WHEREAS, Lecture, address or any other form of instruction to opticians and optometrists by ophthalmologists is not only a breach of the Principles of Medical Ethics which control our professional relationships but is also to the detriment of the ocular health of the public by giving it a false sense of security, and

WHEREAS, General health and ocular comfort depend on the best medical care, therefore be it

*Resolved*, That the Section on Ophthalmology of the American Medical Association declares that it is unethical for any member of the American Medical Association to give lectures or courses of instruction or to consult with any one not associated with the actual medical service, and be it further

*Resolved* That the House of Delegates of the American Medical Association be asked to make a ruling to this effect

At a meeting of the Section on Ophthalmology in executive session, June 10, 1942 the following resolution was presented by Dr Parker Heath and seconded by Dr Charles A Bahn

*Resolved*, That the Section on Ophthalmology instructs its delegate to the House of Delegates of the American Medical Association that it wishes to rescind the resolution of 1941

**Report of Reference Committee on Military  
Preparedness**

Dr John H O'Shea, Chairman, presented the following report, which was adopted on motion of Dr O'Shea, seconded by Dr William R Brooksher, Arkansas, and carried

Resolution on Message from Mr Paul V McNutt Your reference committee recommends approval of this resolution and that it be referred to the newly created War Participation Committee of the American Medical Association for continued action

Respectfully submitted,

JOHN H O'SHEA, Chairman  
FRANCIS F BORZELL  
WILLIAM D JOHNSON  
S E THOMPSON  
GEORGE F LULL  
HAROLD W SMITH  
CHARLES H PHIFER

**Resolution from Section on Preventive and Industrial  
Medicine and Public Health on Civilian  
Health Protection in War**

Dr Stanley H Osborn, Section on Preventive and Industrial Medicine and Public Health, presented the following resolution, which was adopted on motion of Dr Osborn, seconded by Dr George Blumer, Connecticut, and carried

WHEREAS, A major inadequacy in the civilian health protection in war as in peace time continues from the failure of many states and of not less than half the counties in the states to provide even minimum necessary sanitary and other preventive services for health, by full time professionally trained medical and auxiliary personnel on a merit system basis supported by adequate tax funds from local and state and where necessary from federal sources, therefore be it

*Resolved*, That the Trustees of the American Medical Association be urged to use all appropriate resources and influences of the Association to the end that, at the earliest possible date, complete coverage of the nation's area and population by local, county, district or regional full time modern health services be achieved

**Requests for Unanimous Consent to Introduce  
Resolutions**

**RESOLUTION DEALING WITH SCHOOLS OF OPTOMETRY**

Dr A T McCormack, Kentucky, requested unanimous consent to introduce a resolution dealing with schools of optometry, which was not granted

**RESOLUTION DEALING WITH THE STATUS OF WOMEN  
PHYSICIANS IN REGARD TO THE WAR**

Dr Emily D Barringer, New York, received unanimous consent for the introduction of the following resolution

WHEREAS, At a public meeting last evening, called for the purpose of informing women physicians what part they might play in war activities the fact was disclosed that there is little accurate information as to what the women physicians of the United States have done, to date, in medical preparedness for war service, and

WHEREAS, The American Medical Women's Association started about two years ago an intensive study of women physicians available for war service, and during the past summer a coast to coast personal canvass was carried on by the chairman of this special committee, and all of this material has been compiled, tabulated and is ready for use, and

WHEREAS, This fact has been publicized in the newspapers and press of the country and, through the courtesy of the Editor of the *New York State Journal of Medicine*, a series of letters has been published relative to the problems of war time service for women physicians, and

WHEREAS, The American Medical Association has not to date helped its minority group of women physicians to make use of their earnest efforts to do a patriotic job in time of great national emergency, and it has been stated in this House of Delegates during this week that military rating applies to only a small group of women physicians now ready to serve, and

WHEREAS, Governor McNutt in a recent address has stressed the urgent need of five thousand physicians by July 1, and

WHEREAS, The American Medical Women's Association is ready to produce its quota of women physicians for that date, therefore be it

*Resolved*, That the Editor of *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION* be requested to write a sympathetic editorial on this subject and that *THE JOURNAL* print a full and detailed report relative to it from the American Medical Women's Association

It was moved by Dr Barringer that the resolution be adopted and the motion was seconded by Dr Arthur J Bedell, Section on Ophthalmology, but, after discussion, was not adopted

**ELECTION OF OFFICERS**

The Speaker declared the next order of business to be the election of officers

**Election of President-Elect**

Dr Olin H Weaver, Georgia, nominated for President Elect Dr James E Paullin, Atlanta, Ga, and the nomination was seconded by Drs F S Crockett, Indiana, Walter G Plummer, Massachusetts, William R Brooksher, Arkansas, H B Everett and E G Wood, Tennessee, Clyde L Cummer, Section on Dermatology and Syphilology, James Q Graves and Leon J Menville, Louisiana, John Z Brown, Utah, Stephen I Gr Wisconsin, Henry A Luce, Michigan, J Newton Hunter, Pennsylvania, Thomas A Pitts, South Carolina, S I Har son and E H Cary, Texas, William A Mulherin, Georgia, Andrew F McBride, New Jersey, Thomas F Th Iowa, Marion C Pruitt, Georgia, and the New York

tion Dr George W Kosmak, New York, moved that the nominations be closed, and the motion was seconded by Dr Marion C Pruitt Georgia, and Dr Robert A Peers, California, and carried. On motion of Dr A T McCormack, Kentucky, seconded by Dr Walter G Phippen, Massachusetts, and carried, the Secretary cast the vote of the House for Dr James E Paullin, Atlanta, Ga, for President-Elect of the American Medical Association and the Speaker declared Dr Paullin so elected.

#### Election of Vice President

Dr John Andrew, Colorado, nominated for Vice President Dr John W Ames, Denver.

Dr E H Cary, Texas, nominated for Vice President Dr William J Carrington, Atlantic City, N J, and the nomination was seconded by Drs Hilton S Read, New Jersey, and George W Kosmak, New York.

The Speaker, hearing no other nominations, declared the nominations closed and the tellers spread the ballot. The Secretary announced that 140 votes had been cast, of which Dr Carrington received 75 and Dr Ames 65. The Speaker declared that the House had elected to serve as Vice President for the ensuing year Dr William J Carrington, Atlantic City, N J, and requested the New Jersey delegation to bring Dr Carrington to the hall to present him to the House.

#### Introduction and Address of Dr James E Paullin

Dr A A Walker, Alabama, introduced to the House Dr James E Paullin, Atlanta, Ga, newly elected President-Elect, who addressed the House as follows:

*Mr Speaker, Gentlemen* With the deepest feeling of humility I accept from this House of Delegates the office of President-Elect of the greatest and most magnificent medical organization in the world. To have been chosen as one in whom you are willing to place this confidence fills my soul with pride and is recognized as a tribute, which, any one would agree, is the highest honor which a noble profession can bestow on one of its members.

At this particular time no one is more conscious of the numerous responsibilities which rest on the American Medical Association than I. No one realizes more than I the obligation which this organization representing a group of the best citizens of these United States has assumed and will continue to assume in an all out effort to win this war.

No one appreciates more the increasing dependence of the federal government on us for leadership, guidance and help in that field where we are best qualified to perform, and no organization is more willing to cooperate whole heartedly with the federal government in performing this duty.

It seems terribly strange and at times almost irreconcilable that a profession which has always served individuals and peoples as an effective agent in the prevention of disease, diminishing health want curing the sick, prolonging and making more effective the declining years and a profession which is always busily engaged both by precept and by example in teaching others to enjoy the blessings of peace, happiness and contentment should assume this role now in a greater and more powerful degree because of the inhuman, cowardly and dastardly act of two individuals who respect neither God nor man and to whom justice, wisdom and charity are unknown.

The enormity of the task that faces us we are just beginning to realize. The citizens of our country look to us now to furnish to our boys who have made and are willing to make the supreme sacrifice to protect those who remain at home necessary medical care and rapid rehabilitation from disease and injury. The medical profession will do this and I am firmly convinced from an intimate knowledge and close association with this group of professional people over a long period of years that they will not fail. They never have failed, and my belief is that they never will fail.

I therefore as your President-Elect together with every other officer and employee of our Association pledge the fullest cooperation of this the largest greatest most altruistic and

humanitarian group on this earth, our all out effort in this national crisis to win this war not only for our people but for all people wherever they are or whoever they may be who wish life, liberty and freedom.

To this end we ask for and beseech the help, aid and guidance of Him who said "Thou shalt have no other gods before Me." God bless you every one.

#### Election of Secretary

Dr William R Brooksher, Arkansas, nominated Dr Olin West, Chicago, to succeed himself as Secretary of the American Medical Association, and the nomination was seconded by Drs E G Wood, Tennessee, and William A Mulherin, Georgia, and many others. Dr Leon J Menville, Louisiana moved that the nominations be closed, and the motion was duly seconded and carried unanimously. Dr Arthur J Bedell, Section on Ophthalmology, moved that, in recognition of the service of the Secretary, the House stand and cast the ballot unanimously for Dr West. The motion was carried by a rising vote, and the Speaker declared Dr West elected Secretary for the ensuing year.

#### Election of Treasurer

Dr James R Bloss, Chairman, Executive Committee, Board of Trustees, in behalf of the Board of Trustees placed in nomination for Treasurer Dr Herman L Kretschmer, Chicago, to succeed himself. On motion of Dr E H Cary, Texas, seconded by Dr Joseph F Smith, Wisconsin, and carried, the nomination was confirmed, and the Speaker announced that Dr Herman L Kretschmer, Chicago had been elected Treasurer for the ensuing year to succeed himself.

#### Election of Speaker of House of Delegates

Dr R W Fouts, Vice Speaker, took the Chair and stated that the next order of business was the election of a Speaker of the House of Delegates.

Dr E G Wood, Tennessee, nominated Dr H H Shoulders, Nashville, Tenn, to succeed himself as Speaker of the House of Delegates. The nomination was seconded by Drs H B Everett, Tennessee, Andrew F McBride, New Jersey, William R Brooksher, Arkansas, John Z Brown, Utah, J Newton Hunsberger, Pennsylvania, and James Q Graves, Louisiana. Dr Thomas F Thornton, Iowa, moved that the nominations be closed. The motion was seconded by Dr William R Brooksher, Arkansas and carried. On motion of Dr A T McCormack, Kentucky, seconded by Dr Andrew F McBride, New Jersey, and carried, the Secretary cast the ballot of the House for Dr H H Shoulders, Nashville, Tenn, for Speaker of the House of Delegates for the ensuing year, and the Vice Speaker declared Dr Shoulders so elected.

#### Election of Vice Speaker of the House of Delegates

The Speaker resumed the Chair and announced that the next order of business was the election of a Vice Speaker of the House of Delegates.

Dr James Q Graves, Louisiana, nominated Dr R W Fouts, Omaha, to succeed himself as Vice Speaker of the House of Delegates and the nomination was seconded by Drs G Henry Mundt, Illinois, Olin H Weaver, Georgia, and Leon J Menville, Louisiana. It was moved by Dr William A Mulherin, Georgia, seconded by Dr John Z Brown, Utah and carried, that the nominations be closed, and the Speaker declared Dr R W Fouts, Omaha, unanimously elected Vice Speaker of the House of Delegates for the ensuing year to succeed himself.

#### Election of Trustees

Dr William R Molony Sr, California, nominated for Trustee to succeed Dr Arthur W Booth, Elmira, N Y whose term has expired and who is not eligible, according to the By-Laws, for reelection, Dr Edward M Pallette Sr, Los Angeles and the nomination was seconded by Drs Charles E Mongan, Massachusetts, William Weston, Section on Pediatrics, James M Hayes, Minnesota, Joseph F Smith, Wisconsin, E S Hamilton, Illinois, Robert L Anderson, Pennsylvania, Hilton S Reed, New Jersey and E E Barlow, Arkansas.

Dr Thomas A McGoldrick, New York, placed in nomination the name of Dr Charles Gordon Heyd, New York

It was moved by Dr William A Mulherin, Georgia, seconded by Dr L W Larson, Section on Pathology and Physiology, and carried, that the nominations be closed

The tellers spread the ballot and the Secretary announced that 139 votes had been cast, of which Dr Edward M Pallette Sr received 104 and Dr Charles Gordon Heyd 35 The Speaker declared Dr Edward M Pallette Sr, Los Angeles, elected Trustee for a term ending in 1947 to succeed Dr Arthur W Booth On motion of Dr Thomas A McGoldrick, New York, seconded by Drs George W Kosnak, New York, and Robert A Peers, California, and carried, the vote for Dr Pallette was made unanimous

The Speaker announced that the next order of business was the election of a Trustee for a term of five years to succeed Dr R L Sensenich, South Bend, Ind

Dr F S Crockett, Indiana, nominated Dr R L Sensenich, South Bend, Ind, to succeed himself for a term of five years, and the nomination was seconded by Drs E S Hamilton, Illinois, James C Sargent, Wisconsin, William R Brooksher, Arkansas, John Z Brown, Utah, John H O'Shea, Washington, and Robert E Schlueter, Missouri The nominations were closed on motion of Dr A T McCormack, Kentucky, seconded by Dr J Newton Hunsberger, Pennsylvania, and carried On motion of Dr Andrew F McBride, New Jersey, seconded by Dr James C Sargent, Wisconsin, and carried, the Secretary cast the ballot of the House for Dr R L Sensenich, South Bend, Ind, to succeed himself as a Trustee for a term ending in 1947 The Speaker declared Dr Sensenich so elected

### Nominations for Standing Committees

#### NOMINATIONS BY DR FRED W RANKIN, PRESIDENT

Dr Fred W Rankin, President, submitted the following nominations for standing committees, which, on motions duly made, seconded and carried, were confirmed by the House

Dr Lloyd Noland, Fairfield, Ala, to succeed Dr Holman Taylor, Fort Worth, Texas, as a member of the Judicial Council for a term ending in 1947

Dr Clyde L Cummer, Cleveland, to succeed himself as a member of the Council on Scientific Assembly, for a term ending in 1947

Dr James E Paullin, President-Elect, requested that he be relieved of his membership on the Council on Scientific Assembly in view of his election as President-Elect and that Dr Rankin be allowed to appoint some one for his unexpired term The request of Dr Paullin was granted on motion of Dr G Henry Mundt, Illinois, seconded and carried

Dr Rankin nominated as a member of the Council on Scientific Assembly to fill the unexpired term of Dr James E Paullin ending in 1943 Dr Edward L Bortz, Philadelphia The nomination was confirmed on motion of Dr John Z Brown, Utah, seconded by Dr Olin H Weaver, Georgia, and carried

#### NOMINATION BY THE BOARD OF TRUSTEES

Dr James R Bloss, Chairman, Executive Committee, Board of Trustees, placed in nomination the name of Dr Reginald Fitz, Boston, to succeed himself as a member of the Council on Medical Education and Hospitals for a term ending in 1949 It was moved by Dr Arthur J Bedell, Section on Ophthalmology, seconded by Dr E S Hamilton, Illinois, and carried, that the nomination be confirmed, and Dr Reginald Fitz, Boston, was declared elected a member of the Council on Medical Education and Hospitals for a term of seven years to succeed himself

### Election of Associate and Affiliate Fellows

The Secretary presented the following nominations for Associate and Affiliate Fellowship, properly approved according to the By-Laws, which, on motions, duly made, seconded and carried were confirmed

### NOMINATIONS OF AMERICAN MEDICAL MISSIONARIES FOR ASSOCIATE FELLOWSHIP APPROVED BY THE JUDICIAL COUNCIL

Ainslie, C A, Guatemala, C A  
Allison, Mary Bruns, Douglaston, N Y  
Casberg, Melvin A, Yeotml District, India  
Horner, Marjory C, Congo, Belge, W C, Africa  
Horner, W Howard, Congo, Belge, W C, Africa  
Hugblett, W S, Cocoa, Fla  
Vroon, John, Sialkot, Punjab, India  
Wallis, Calvin P, Baguio, P I

### NOMINATIONS FOR ASSOCIATE FELLOWSHIPS APPROVED BY THE SECTIONS INDICATED

#### PRACTICE OF MEDICINE

McLern, Franklin C, Chicago

#### LARYNGOLOGY, OTOTOLOGY AND RHINOLOGY

Fountain, Lee S, San Antonio, Texas  
Murray Harold H, Seattle

#### EXPERIMENTAL MEDICINE AND THERAPEUTICS

Flemister, L J, Jr, Washington, D C  
Shelinski, Herman A, Philadelphia

#### PATHOLOGY AND PHYSIOLOGY

Novak, Milin V, Chicago

#### PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH

Gudakunst, Don W, New York  
Lambert, Sylvester M, Walnut Creek, Calif

### NOMINATIONS FOR AFFILIATE FELLOWSHIPS APPROVED BY THE COUNCIL ON SCIENTIFIC ASSEMBLY

| Jackson Carl A, Kansas City, Mo              |  |

### Appointment of Members of War Participation Committee of American Medical Association

In accordance with the action of the House of Delegates, the Speaker appointed the following members of the newly created War Participation Committee of the American Medical Association: Drs. Walter F. Donaldson, Pittsburgh, Chairman, Edward R. Cunniffe, New York, Clyde L. Cumner, Cleveland, John H. O'Shea, Spokane, Wash., and William R. Molony Sr., Los Angeles. In accordance with the action of the House, the ex officio members of the Committee are the President, the President-Elect, the Chairman of the Board of Trustees, the Secretary and the Editor of *THE JOURNAL* of the American Medical Association.

### Place of 1945 Annual Session

Dr. James R. Bloss, Chairman, Executive Committee, Board of Trustees, reported that two invitations had been received for the 1945 annual session, one from New York and the other from Atlantic City, N. J., and that the Secretary has information showing that the accommodations to be provided by each of the cities are such that a satisfactory session can be held in either of them.

Dr. Andrew F. McBride, New Jersey, invited the Association to come to Atlantic City, N. J., in 1945 and Dr. Thomas A. McGoldrick invited the Association to meet in New York in 1945.

### Presentation and Address of Vice President

Dr. Hilton S. Read, New Jersey, presented the newly elected Vice President, Dr. William J. Carrington, Atlantic City, N. J., who addressed the House as follows:

*Mr. Speaker and Members of the House:* Let me thank you for this totally unexpected and wholly surprising honor, the greatest that has ever come to me in my life. It takes my breath away, and I have just enough breath left to say to you that I will devote a full measure of zeal and devotion and loyalty to this American Medical Association which it so richly deserves. Thank you.

### Place of 1945 Annual Session (Continued)

The tellers spread the ballot and the Secretary announced that 107 votes had been cast, of which New York received 65 and Atlantic City, N. J., 42. The Speaker declared that New York had been selected as the place of annual session in 1945.

### Expressions of Appreciation

It was moved by Dr. A. T. McCormack, Kentucky, that the House of Delegates of the American Medical Association express to the Medical Society of New Jersey and to the Atlantic County Medical Society, to the officials of Atlantic City and New Jersey and to the people, its profound gratitude for the splendid hospitality that had been extended to the American Medical Association during the stay in Atlantic City, to the press of the United States for the excellent reports that had been made, and to the newly elected Vice President, Dr. Carrington, and his associates for the untiring work that all know was necessary to make this session the smooth, perfect success it has been and to the Woman's Auxiliary of New Jersey and of Atlantic City for the beautiful hospitality they had extended. The motion was seconded by Drs. J. Newton Hunsberger, Pennsylvania, and Olin H. Weaver, Georgia, and carried unanimously.

Dr. Arthur J. Bedell, Section on Ophthalmology, moved that the Secretary stand and receive the resolution that the members of the House of Delegates desire to rise and express appreciation to the Speaker of the House for the masterful way in which he has conducted this session.

The Delegates arose and the Secretary stated that the intent of the gentleman's suggestion was carried out enthusiastically and without any opportunity to put the question and that

the Speaker might therefore consider himself thanked and appreciated.

The Speaker expressed to the members of the reference committees his high appreciation as well as that of the House for the excellent work they had done, that in many instances the job of the reference committees was an arduous one that there were about sixty members of the reference committees out of one hundred and seventy-five in the House, that the entire membership of the House had found its way to the rooms of the reference committees, and that the excellent work done by the committees had simplified the procedure of the House. The Speaker requested the House to join with him in a little expression of appreciation to the members of the reference committees.

The House of Delegates adjourned sine die at 4:10 p. m.

### REGISTRATION AT ATLANTIC CITY

The total registration at Atlantic City was 8,238. Below are summaries of the registration by sections and by states.

## THE SCIENTIFIC EXHIBIT

The Scientific Exhibit at the Atlantic City session was noted for its Pan American participation. Several of the proposed exhibits from Central and South America were canceled because of the difficulties of transportation, there were eighteen Pan American exhibits on the program, however, of which thirteen were eventually installed, the others being delayed or lost in transit.

The large number of Army and Navy uniforms that were seen in the Scientific Exhibit constantly attested the part which the medical profession is playing in the present emergency. Many prospective exhibitors were forced to withdraw from participation in the meeting because of war duties. Others, however, obtained leave to present their material. The U S Army, the U S Navy, the U S Public Health Service, the Selective Service System, the Procurement and Assignment Service and the Office of Civilian Defense all had exhibits relating to the war effort.

The Special Exhibit on Fractures was presented for the twelfth time under the auspices of a committee composed of Dr Kellogg Speed, Chicago, chairman, Dr Frank D Dickson, Kansas City, Mo., and Dr Walter Estell Lee, Philadelphia. Appreciation is expressed to Dr James H Mason III, Atlantic City, who served as local representative, and to Mrs Nellie McGurran, superintendent of the Atlantic City Hospital, for their help and cooperation. Nearly fifty physicians assisted with the demonstrations in six booths continuously throughout the week, and a pamphlet describing the exhibit was distributed.

The Special Exhibit on Backache was presented for the third time under the auspices of a committee composed of Dr Frank R Ober, Boston, chairman, Dr Carl E Badgley, Ann Arbor, Mich., Dr J Archer O'Reilly, St Louis, Dr Arthur Stendler, Iowa City, and Dr Philip D Wilson, New York, with the collaboration of Dr Eben J Carey, Milwaukee, Dr Albert Ferguson, Brookline, Mass., Dr H Close Hesseltine, Chicago, Dr K G Hansson, New York, Dr Theodore A Willis, Cleveland, and Dr Walter Zeit, Milwaukee, and an advisory committee consisting of Dr Fremont A Chandler, Chicago, Dr H Earle Conwell, Birmingham, Ala., Dr John S Coulter, Chicago, Dr Philip Lewin, Chicago, Dr Robert D Schrock, Omaha, Dr E Harlan Wilson, Columbus, Ohio, and Dr Walter J Zeiter, Cleveland. A group of fifty physicians participated throughout the week in the demonstrations, and a pamphlet describing the exhibit was distributed.

Lectures and demonstrations on poliomyelitis and diabetes were given throughout the week in two theaters adjoining the exhibits.

The Section on Practice of Medicine presented twenty-nine exhibits, including sixteen in the symposium on cardiovascular disease. Dr Louis B LaPlace, Philadelphia, was the section representative.

The Section on Surgery, General and Abdominal, presented twenty-eight exhibits. The section representative was Dr Grover C Penberthy, Detroit.

The Section on Obstetrics and Gynecology presented ten exhibits. The section representative was Dr Charles Edwin Galloway, Evanston, Ill.

The Section on Ophthalmology had eleven exhibits. The committee from the section consisted of Dr Georgiana Dvorak Theobald, Oak Park, Ill., chairman, Dr Derrick Vail, Cincinnati, and Dr W Ivan Lillie, Philadelphia.

The Section on Laryngology, Otology and Rhinology presented six exhibits. The section representative was Dr Fred W Dixon, Cleveland.

The Section on Pediatrics had six exhibits. The section representative was Dr Arthur F Abt, Chicago.

The Section on Experimental Medicine and Therapeutics presented twenty-three exhibits. The section representative was Dr Dwight L Wilbur.

The Section on Pathology and Physiology presented twenty exhibits. The section representative was Dr Frank W Konzelmann, Philadelphia.

The Section on Nervous and Mental Diseases presented seven exhibits. The section representative was Dr Frederick P Moersch, Rochester, Minn.

The Section on Dermatology and Syphilology showed eleven exhibits. The section representative was Dr Hamilton Montgomery, Rochester, Minn.

The Section on Preventive and Industrial Medicine and Public Health presented fourteen exhibits. The representative to the section was Dr Paul A Davis, Akron, Ohio.

The Section on Urology presented seven exhibits. The section representative was Dr John H Morrissey, New York.

The Section on Orthopedic Surgery presented ten exhibits. The representative to the section was Dr Jesse T Nicholson, Philadelphia.

The Section on Gastro-Enterology and Proctology had ten exhibits. The representative to the section was Dr Grant H Laing, Chicago.

The Section on Radiology presented ten exhibits. The section representative was Dr S W Donaldson, Ann Arbor, Mich.

The Section on Anesthesiology presented seven exhibits. The section representative was Dr Paul M Wood, New York.

Seventy-eight motion pictures were shown continuously throughout the week in four theaters directly adjacent to the exhibits.

Thirty-six papers read before the sections of the Scientific Assembly were correlated with the exhibits in the Scientific Exhibit.

Acknowledgment is made to the local committee on Scientific Exhibit, of which Dr R A Kilduffe was chairman.

## REPORT OF THE COMMITTEE ON AWARDS

The Committee on Awards made the following report:

## GROUP I

*(Awards in Group I are made for exhibits of individual investigation, which are judged on the basis of originality and excellence of presentation.)*

The GOLD MEDAL to Eben J Carey and Leo C Massopust, Marquette University Medical School, Milwaukee, for exhibit on Experimental Ameboid Motion of Motor End Plates.

The SILVER MEDAL to Deryl Hart and Samuel E Upchurch, Duke University School of Medicine and Duke Hospital, Durham, N C., for exhibit on Air Disinfection with Bactericidal Radiant Energy.

The BRONZE MEDAL to O V Batson, Graduate School of Medicine of the University of Pennsylvania, Philadelphia, for exhibit on the Vertebral Vein System as a Mechanism for Spread of Metastases.

CERTIFICATES OF MERIT, Group I, are awarded to the following (alphabetically arranged):

Louis H Barenberg, David Green, Walter Levy and Nathan Greenstein, Morrisania City Hospital, New York, for exhibit on Prevention of Contagion in Pediatric Wards with Use of Human Serum or Plasma.

Carlos Monge and Associates from the Faculty of Medicine and National Institute of Andean Biology, Lima, Peru, for exhibit on Chronic Mountain Sickness.

Joseph F Ross and Milun A Chapin, Evans Memorial and Massachusetts Memorial Hospital, Boston, for exhibit illustrating the Application of Radioactive Isotopes to Medical Investigation

Donald Slaughter and T T Wright, Baylor University, College of Medicine, Dallas, Texas, for exhibit on a Quantitative Pain Threshold Machine

Howard I Suby, Robina M Suby, Fuller Albright and Hirsch Sulikowitch, Massachusetts General Hospital, Boston, for exhibit on Kidney Stones (a) Retrograde Dissolution of Calcium Phosphate, (b) Determination of Chemical Composition by X-Ray Appearance

J Ross Veal and Roy G Klepser, Gallinger Municipal Hospital, Washington, D C, for exhibit illustrating the Treatment of Frostbite of the Extremities

In addition the following exhibits are deemed worthy of Honorable Mention (alphabetically arranged)

That of Frank W Hartman, Victor Schelling, Henry N Harkens, Brock Brush and Kenneth W Warren, Henry Ford Hospital, Detroit, on the Relative Value of Pectin Solution in Shock

That of Joseph M Hill, E E Muirhead and Lewis Waters, Baylor University Hospital, Dallas, Texas, on Shock Therapy

That of Henry Minsky, Mount Sinai Hospital, New York, on the Zonular Chamber of the Eye

That of E A Rovenstine, Homer W Smith, E M Papper and S E Bradley, New York University College of Medicine, New York, on Circulatory Changes During Spinal Anesthesia

That of Isaac Starr and A J Rawson, University of Pennsylvania, Philadelphia, on the Ballistocardiograph, with Records Obtained in the Common Diseases of the Heart and Circulation

That of Max M Strumia and John J McGraw, Bryn Mawr Hospital, Bryn Mawr, Pa, on the Preparation and Preservation of Human Blood Plasma

#### GROUP II

*(Awards in Group II are made for exhibits which do not exemplify purely experimental studies and which are judged on the basis of excellence of presentation and correlation of facts)*

The GOLD MEDAL to John C Bugher and Manuel Roca-Garcia, Section of Special Studies, National Department of Health, Bogota, Colombia, for exhibit on the Epidemiology of Jungle Yellow Fever

The SILVER MEDAL to Emanuel Libman of New York for exhibit illustrating Endocarditis and "Libman-Sack Disease"

The BRONZE MEDAL to L M Randall, M C Piper, L A Brunsting and M B Dockerty, Mayo Clinic, Rochester, Minn, for exhibit on Kraurosis and Allied Lesions of the Vulva and Certain Neoplasms of the Ovary

CERTIFICATES OF MERIT, Group II, are awarded to the following (alphabetically arranged)

Charles S Capp and Martha Mottram, University of California Hospital, San Francisco, for exhibit on Bone Lesions Involving the Sacrum

William Dameshek, Tibor J Greenwalt, Russell J Tat and Camille Dryfus, J H Pratt Diagnostic Hospital and Boston Dispensary, Boston, for exhibit on the Hemolytic Syndromes Hemoglobinurias, Hereditary and Acquired Hemolytic Anemias

William Dressler, Israel Zion Hospital, Brooklyn, and the Brooklyn Hospital, New York, for exhibit on the Cardiac Topography and Physical Diagnosis of the Heart

Carl F Jordan and Irving H Borts, Iowa State Department of Health Des Moines, Iowa, for exhibit on Brucellosis or Undulant (Malta) Fever

Irwin Schulz Milwaukee Children's Hospital, Milwaukee, for exhibit on Wringer Injury

Frederick Steigmann, Hans Popper and Karl A Meyer, Cook County Hospital, University of Illinois College of Medicine and Cook County Graduate School of Medicine, Chicago, for exhibit on Liver Function in Clinical Medicine

In addition, the following exhibits are deemed worthy of Honorable Mention (alphabetically arranged)

That of Thomas N Horan and C Graham Eddy, Eloise Hospital and Harper Hospital, Detroit, on Laparoscopy Intra-Abdominal Photography in color

That of Elmer H Loughlin, Richard H Bennett, Samuel H Spitz and William W Carty with the assistance of Mary E Flanagan, Long Island College Hospital, Brooklyn, on Pneumonia

That of L H Mousel, H W Schmidt and A H Bulbulian, Mayo Clinic, Rochester, Minn, on Causes, Prevention and Treatment of Postoperative Atelectasis

That of Don Carlos Peete, University of Kansas Medical School, Kansas City, Kan, on Acute Rheumatic Fever and Its Complications

That of Harold W Smith, Bureau of Medicine and Surgery Navy Department, Washington, D C, on the Medical Department of the United States Navy

That of Marcy L Sussman, M F Steinberg and Arthur Grishman, Mount Sinai Hospital, New York, on Angiocardiography in Congenital and Rheumatic Heart Disease

#### CERTIFICATES OF APPRECIATION

Especially noteworthy are the thirteen exhibits contributed by our sister Pan American republics. These were planned before the war was brought to the shores of the Western Hemisphere but, in spite of the difficulties and hazards which the war entailed, these exhibitors with the support of their governments were most willing to carry on as planned. Most of the exhibits which have not arrived were either lost or delayed in transit.

With this splendid contribution to the Scientific Exhibit at this session, Certificates of Appreciation are gratefully awarded to each of the following exhibitors

Raul F Vacarezza and Juan Paso, Catedra de Patologia y Clinica de la Tuberculosis, Buenos Aires, Argentina, for exhibit on Epidemiology of Tuberculosis in Argentina—Its Influence on the Human Economic Value

Enrique Viacava, Buenos Aires, Argentina, with the assistance of Hayes E Martin, Memorial Hospital, New York, for exhibit on Cancer of the Lip

Guillermo A Bosco, University of Buenos Aires Medical School, Buenos Aires, Argentina, for exhibit on Anatomic Revision of the System of Coronary Arteries. New Nomenclature of Myocardial Infarct and Clinical and Symptomologic Bases for an Anatomicotopographic Diagnosis of Coronary Arterial Obstruction

Alejandro Lipschutz, Department of Experimental Medicine of the National Health Service, Republic of Chile, Santiago, Chile, for exhibit on Experimental Uterine and Extragenital Fibroids Induced by Estrogens. Metaplasia and Adenomatous Polyps of Endometrium

Gonzalo Esguerra-Gomez, Clinica de Marly, Bogota, Colombia, for exhibit on Bone Changes in Leprosy

Horacio Zalce, Mexico City, Mexico, with the assistance of Bradley L Coley, Memorial Hospital, New York, for exhibit on Bone Tumors

J Menendez Feros, service of Pedro A Castillo, University of Havana, Havana, Cuba, for exhibit on the Electrocardiogram

P L Farinas, University Hospital, Havana, Cuba, for an exhibit on Mucosography of the Organs of the Respiratory Tract

V Pardo-Castello and Francisco R Tiant, University of Havana Medical School, Havana, Cuba, for an exhibit on Leprosy. The Correlation of Its Clinical, Immunologic, Pathologic and Bacteriologic Aspects

National Department of Health of Brazil, Service of Studies and Investigations of Yellow Fever, Rio de Janeiro, Brazil, for an exhibit on Yellow Fever in Brazil

National Department of Health of Brazil, Malária Service for the Northeast, Rio de Janeiro, Brazil, for an exhibit on the Story of the Eradication of Anopheles (Myzomyia) Gambiae from Brazil

(Carlos Monge and Associates from the Faculty of Medicine and National Institute of Andean Biology, Lima, Peru, are awarded the Certificate of Merit in Group I)

(John C. Bugher and Manuel Roca-Garcia, Section of Special Studies, National Department of Health, Bogota, Colombia, are awarded the Gold Medal in Group I)

#### SPECIAL CERTIFICATES OF MERIT

Of great interest and value are the special lectures and demonstrations on diabetes and the Kenny method for the treatment of poliomyelitis. The large and attentive audiences at each of these demonstrations is convincing evidence of the interest and appreciation of them. The Committee on Awards compliments the director of the Scientific Exhibit on the arrangement of these exhibits and expresses its appreciation to the exhibitors by awarding to each of them a Special Certificate of Merit.

#### SUBSIDIZED EXHIBITS

Of unusual educational value are the Special Exhibits on Fractures and Backache sponsored by the American Medical Association, and the exhibit on Dietary Deficiency Diseases presented by members of the Council on Foods and Nutrition of the American Medical Association.

#### COMMENTS AND RECOMMENDATIONS

On entrance to the Scientific Exhibit this year, one is immediately impressed with the pleasing and attractive appearance of the hall. This creates an atmosphere immediately favorable to the attendance at and interest in the individual exhibits. The Committee on Awards commends those responsible for the Scientific Exhibit for this splendid achievement.

The showing of silent and sound motion pictures in small theaters adjoining the exhibit hall is again proving to be a most valuable adjunct to the exhibit proper. The excellence of these pictures from the point of view both of photographic and of educational value, is worthy of special commendation. It is the recommendation of the Committee on Awards that this feature of the Scientific Exhibit be continued.

The Scientific Exhibit is intended to serve two primary purposes: the presentation of new developments in medicine and the instruction of the profession in regard to diseases and conditions of interest and importance to them. The exhibit this year serves well both of these purposes, but especially impressive is the teaching value of many of the exhibits and demonstrations.

The representatives to the Scientific Exhibit from the sixteen sections have rendered invaluable service to the Committee on Scientific Exhibit and to the director of the Scientific Exhibit in encouraging the presentation of exhibit material of special interest and merit. Only the limitation in the number of awards available prevented official recognition of a large number of exhibits of undoubted merit.

The Committee on Awards wishes to express the appreciation of the thousands of physicians who have profited by these exhibits to the Committee on Scientific Exhibit of the Board of Trustees, the Advisory Committee to the Scientific Exhibit, the section representatives and to the director of the Scientific Exhibit for this unique and interesting postgraduate instruction in medicine.

Under the able direction of Dr. Thomas G. Hull, the Scientific Exhibit has clearly become the outstanding feature of the annual session of the American Medical Association.

HAROLD S. DIEHL, Minneapolis, Chairman  
MAX M. PEET, Ann Arbor, Mich.  
JOHN W. SCOTT, Lexington, Ky.  
A. C. IVY, Chicago  
H. S. MARTLAND, Newark, N. J.

## MEDICAL LEGISLATION

### MEDICAL BILLS IN CONGRESS

*Changes in Status*—S. 2412 has been reported to the Senate, providing benefits for the injury, disability, death or enemy detention of civilians and for the prevention and relief of civilian distress arising out of the present war. H. R. 7164 has passed the Senate, amending the Soldiers' and Sailors' Civil Relief Act of 1940. The purpose of the reported bill is to make available additional and further relief and benefits to persons in the military and naval forces. Among other things, it brings within the purview of the act transactions occurring subsequent to Oct. 17, 1940, provides for the cancellation of leases entered into by persons subsequently called into military service and covering premises occupied for dwelling, professional, business, agricultural or similar purposes, and, in connection with premiums on insurance policies, extends the benefits of the law to policies up to \$10,000 face value. H. R. 7239 has been reported to the

House, proposing to authorize the Director of the Census to issue certifications of birth records.

*Bills Introduced*—The President has submitted to Congress a supplemental estimate of an appropriation in the amount of \$10,000,000 to assist students, in such numbers as the chairman of the War Manpower Commission shall determine, participating in accelerated programs in degree-granting colleges and universities in engineering, physics, chemistry, medicine (including veterinary), dentistry and pharmacy and such other technical and professional fields as the chairman may determine to be necessary in connection with the national war effort. H. R. 7231, introduced by Representative Dickstein, New York, proposes to create in each corps area of the United States, as now constituted, a medical training school for the instruction of physicians for the armed forces and the United States Public Health Service.

## WOMAN'S AUXILIARY

### Pennsylvania

The Allegheny County auxiliary held its seventeenth birthday party in January, at which Mrs. Charles C. Crouse, state president, was guest of honor. Mrs. Homer W. Grimm, president of the auxiliary, spoke on "Our Part in Defense." A gift of \$350 was voted to the Red Cross.

At the January meeting of the Lycoming County auxiliary, with Mrs. P. Harold Decker presiding, Miss Pauline Naegely of the local chapter of the American Red Cross gave an outline of all the branches of service calling for volunteers to cooperate during the present emergency.

The annual Health Day meeting of the Allegheny County auxiliary was held, March 24, at Pittsburgh. Mrs. Edna Pearson, supervisor of the division of education of the state department of health, spoke on health day programs. Mrs. J. A. Lawrence, from the Pittsburgh chapter of the American Red Cross, talked on the necessity of the blood bank.

The March meeting of the Chester County auxiliary at Thorndale, \$2 was received from each member to apply to the Medical Benevolence Fund. A general discussion of defense activities followed talks by Mrs. Walter W. Davis and Mrs. Howard B. F. Davis on "Nurses Aids."

## Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES NEW HOSPITALS EDUCATION AND PUBLIC HEALTH)

### CALIFORNIA

**State Medical Election**—Dr Karl L. Schaupp, San Francisco, was chosen president-elect of the California Medical Association at its recent meeting in Del Monte and Dr William R. Molony, Sr., Los Angeles, was inducted into the presidency. Dr George H. Kress, San Francisco, was reelected secretary-treasurer. The 1943 session will be held at Del Monte the date to be decided later.

**Health Department Activities**—The cities of Antioch and Pittsburg have transferred the administration of their health affairs to the Contra Costa County Health Department in charge of Dr William A. Powell. Martinez, Dr Fred P. Nevius has been serving as health officer of Antioch and Dr George C. Kelso as health officer of Pittsburg. With the exception of the cities of Richmond and El Cerrito, nearly all of Contra Costa County is now under the jurisdiction of the county health unit. Plans are under way to establish a full time health unit in Marin County.

**Surgical Impostor Never Studied Medicine**—Arthur Osborne Phillips, alias Dr James Herman Phillips, was charged May 26 with impersonating a surgeon and performing major operations without a license at a hospital in Chico, newspapers reported May 28. The man who is said to have served prison terms in five states was held in the city jail on charges of practicing medicine illegally and illegal possession of firearms. The newspaper report stated that an agent for the California Board of Medical Examiners claimed that Phillips' knowledge of surgery came from prison textbooks. The report further stated that according to the state board of medical examiners, the alleged impostor is believed to have performed thirty-one appendectomies during spasmodic masquerading as a physician in the past fourteen years. He assertedly had performed four appendectomies, tonsillectomies and abdominal operations during the two months he had been in Chico. He signed one death certificate and one birth certificate. It was stated

### DELAWARE

**Society News**—The New Castle County Medical Society of Delaware was addressed on May 19 at the Academy of Medicine, Wilmington, by Drs Briece S. Vallett on "Careinoma of the Prostate Gland," Victor D. Washburn "Modern Catheters in the Management of Urinary Retention" and Lang W. Anderson "Some Urologic Problems." All are of Wilmington. Dr Allen F. Voshell, Baltimore, recently addressed the society on "Anatomy of the Knee Joint in Relation to Internal Derangements."

### FLORIDA

**Venereal Disease Control Program**—The state department of health has launched a program of venereal disease control in cooperation with the Works Progress Administration and the U. S. Public Health Service. The campaign will be emphasized in military and war industry areas.

**State Medical Election**—Dr Eugene G. Peck, Ocala, was chosen president-elect of the Florida Medical Association at its annual session in Hollywood April 15. Dr Gilbert S. Osincup, Orlando, was inducted into the presidency and Dr Shaler A. Richardson, Jacksonville, was reelected secretary. St. Petersburg was designated as the place for the next annual meeting April 12-14, 1943.

### GEORGIA

**Postgraduate Clinics**—The Emory Medical Alumni Association conducted its postgraduate clinics June 2-4. At the annual banquet Thursday the following program was presented:

Dr. Walter C. Jones, Jr., Miami, Fla., Reflexes Observed During Abdominal Surgery.  
Dr. Eugene A. Stead, Jr., Atlanta, The Teaching Program in the Department of Medicine.  
Dr. William B. Clark, New Orleans, Anterior Segment Eye Diseases.  
Dr. William K. Parks, Jacksonburg, Miss., The Internist's Responsibility Regarding Physical Problems of Geriatric Patient.

**Crawford Long Memorial Building**—The Medical Association of Georgia at its recent meeting in Augusta set aside \$5000 as a nucleus for a fund to construct the Crawford W. Long Memorial Building. The fund will be increased from

year to year as the association directs. The building is to serve as a memorial to the late Dr. Long and as the permanent headquarters of the association. According to a resolution adopted by the association this action marks the one hundredth anniversary of Dr. Long's discovery of anesthesia. Construction will begin when a suitable fund is available. Plans will be under the direction of the council of the association.

### ILLINOIS

**State Committee to Disseminate Information**—The organization of a statewide public health committee is under way in Illinois to disseminate accurate information for the purpose of developing a widespread intelligent lay understanding of existent public health problems, what is being done, and what can be done to solve them. Frederic C. Woodward, vice president emeritus of the University of Chicago, is chairman of the committee.

**Outbreak of Smallpox**—Eleven thousand persons in the Argo-Summit war plant area southwest of Chicago have been vaccinated because of an outbreak of smallpox there the week of June 15. The disease was discovered when a 21 year old Negro, a resident of Chicago, entered Cook County Hospital with a condition first diagnosed as secondary pustular syphilis. An investigation revealed that he had been visiting his relatives in Summit where others were apparently ill with chickenpox and where subsequent investigation disclosed 8 other cases of smallpox. All the cases were traced to a small Negro boy from Missouri who visited recently in Argo. Twelve nurses of the Cook County Public Health Unit made a house to house canvass, instructing all persons who had not been vaccinated within the last five years to be vaccinated by their own physicians or to be vaccinated by the health department physicians. Vaccination stations were set up in the Argo-Summit Health Center and in the public schools in Summit for persons unable to pay their private physicians. About 4000 persons in plants were vaccinated by industrial physicians, 3000 by family physicians and 4000 in the vaccination clinics.

### Chicago

**Personal**—Dr. Samuel M. Feinberg, Chicago, was appointed honorary member of the Sociedad Argentina para el Estudio de la Algeria, Buenos Aires, Argentina. Dr. Karl A. Meyer has been chosen president of the board of trustees of the University of Illinois.

**Honorary Citations Awarded to Physicians**—Northwestern University presented an award of merit during its commencement June 12 to Dr. Herman L. Kretschmer, treasurer of the American Medical Association, in recognition of worthy achievement which has reflected on Northwestern University. The collegiate division of the University of Chicago awarded honorary citations to the following doctors of medicine, all graduates of Rush Medical College, in special recognition of achievements in their special fields:

Dr. Edward V. L. Brown, 1898, professor of ophthalmology (Rush), University of Illinois College of Medicine.  
Dr. Ralph C. Brown, 1904, professor of medicine (Rush) at Illinois.  
Dr. Noble Sproat Hanes, 1904, professor of obstetrics and gynecology at Illinois.  
Dr. Archibald L. Hoyne, 1904, professor of pediatrics (Rush) at Illinois.  
Dr. Harry E. Mock, 1906, associate professor of surgery, Northwestern University Medical School.  
Dr. Dallas B. Phemister, 1904, Thomas D. Jones, professor and chairman of the department of surgery, University of Chicago.  
Dr. Wilbur E. Post, 1903, Rush professor of medicine at Illinois.  
Dr. Kellogg Speed, 1904, professor of surgery (Rush) at Illinois.

### LOUISIANA

**State Medical Election**—Dr. Charles C. De Gravelles, New Iberia, was chosen president-elect of the Louisiana State Medical Society at its recent annual meeting and Dr. Emmett L. Irwin, New Orleans, was inducted into the presidency. Other officers include Drs. John T. O'Ferrall, New Orleans, William V. Garnier, Bastrop, and Edwin H. Lawson, New Orleans, vice presidents. The next annual meeting will be held in Baton Rouge. Dr. Paul T. Talbot, New Orleans, is secretary-treasurer.

**Dr. Fenner Honored**—Dr. Erasmus D. Fenner, New Orleans, first physician on the staff of Charity Hospital, New Orleans, to complete fifty years service at the hospital was presented with a loving cup in special ceremonies in his home June 1. Dr. Fenner graduated at Tulane University of Louisiana School of Medicine, New Orleans, and was for years in charge of the children's wards and clinics. In 1907 he cof-

finned his work to orthopedics and the surgical diseases of children. In 1920, when separate fracture services were established in the hospital on Dr Fenner's suggestion, he was placed in charge of one of the services and has remained in charge of one or more service continuously since then. He became a member of the teaching staff at Tulane in 1893. He was professor of pediatrics from 1903 to 1907, when a separate department of orthopedics was established with Dr Fenner as the first head. He resigned from this position in 1927, becoming emeritus professor of orthopedics and surgical diseases of children.

### MICHIGAN

**Russel Award to Dr Freyberg**—The Henry Russel Award of the University of Michigan, Ann Arbor, went this year to Dr Richard H. Freyberg, assistant professor of internal medicine at the medical school and director of the Rackham Arthritis Research Unit, for "distinguished achievement in medical research." The award is given annually to a member of the faculty below the rank of associate professor. Dr Freyberg graduated at the University of Michigan Medical School, Ann Arbor, in 1930. In the same year Dr Freyberg received the Sternberg medal, given to the student displaying ability in the study of preventive medicine.

**Construction Started on School of Public Health**—Construction of the new \$750,000 School of Public Health at the University of Michigan, Ann Arbor, has begun. The new unit is located on a hill opposite the observatory and immediately south of the University Hospital group. The west section will be three stories high and contain the principal classrooms, offices, library, auditorium and lounge. Eastward there will extend two wings, each two stories high, to house laboratories and research facilities. The east section will provide facilities for normal animals on the first floor and medium preparations and glassware services on the second floor. On the first floor will be offices and workrooms designed for the teaching of physiologic hygiene and maternal, infant and school health and accommodations for the study of virus diseases. The north wing of the first floor will be assigned to industrial health, with a large laboratory for studies in environmental health, research rooms for industrial toxicology, chemical laboratory and control chambers for studies on human subjects. The second floor will accommodate facilities for health education, museums, public health laboratory practice, public health nursing, laboratories for biostatistics and public health engineering. The third floor will contain classrooms and seminars for graduate and postgraduate instruction. The Rockefeller and W. K. Kellogg foundations have made most of the money available for construction of the unit.

### MINNESOTA

**Physicians Honored**—Dr Henry F. Helmholtz, Rochester, was awarded the Christmas Seal distinguished service plaque of the Minnesota Public Health Association on May 22. The honor went to Dr Helmholtz for his public health and Christmas Seal work in Olmsted County during the past twenty years. Dr Philip S. Hench, Rochester, has been awarded the Heberden Medal for 1942 by the Heberden Society of London "in recognition of his outstanding contributions to knowledge and progress in rheumatic diseases." The society was founded in 1936.

### MISSISSIPPI

**State Medical Election**—Dr Ellis LeRoy Wilkins, Clarksdale, was chosen president-elect of the Mississippi State Medical Association at its annual meeting in Jackson, May 14. Dr Wilkins has been serving as treasurer of the association for a number of years. Dr Thomas M. Dye, mayor of Clarksdale, who has for twenty-five years served as secretary, was reelected to another term of three years. Dr Hubert Lowry Rush, Meridian, was installed as president.

### MISSOURI

**Dr Wood Named Professor of Medicine**—Dr William Barry Wood Jr., Baltimore, has been appointed Busch Professor of Medicine at Washington University School of Medicine, St. Louis, to succeed Dr David P. Barr who resigned last year to accept a similar position at Cornell University Medical College, New York. Dr Wood graduated at Johns Hopkins University School of Medicine in 1936. For a time he worked as an assistant at the Thorndike Laboratory at the Boston City Hospital and more recently as associate in medicine at Johns Hopkins University School of Medicine. He is a member of the Committee on Pneumonia of the Surgeon General of the U. S. Army.

### NEBRASKA

**Personal**—Dr Maine C. Andersen has been appointed director of the health service at the University of Omaha effective September 1. He succeeds Dr John C. Sharpe resigned. Both are from Omaha.—Dr Gregory L. Endre, Omaha, has been named director of the newly created Dodge Saunders counties health unit.

**State Medical Election**—Dr Albert L. Cooper, Scottsbluff, was named president-elect of the Nebraska State Medical Association at its annual meeting in Omaha, May 4-7. Dr Dexter D. King, York, was installed as president and Dr Roy B. Adams, Lincoln, was reappointed secretary-treasurer to serve until May 1945. The 1943 session will be held in Lincoln.

### NEW YORK

**New Professor of Anatomy**—Donald Duncan, Ph.D., associate professor of anatomy, University of Texas Faculty of Medicine, Galveston, Texas, has been appointed professor and head of the department of anatomy at the University of Buffalo School of Medicine, Buffalo. Dr Duncan received his Ph.D. at the University of Minnesota in 1929 and has served on the faculties of medicine of Buffalo and Utah universities.

### New York City

**School Honors Class of 1892**—Dr Charles D. Cropsey, Rutherford, N. J., and Dr Arthur B. Van Loon, Albany, N. Y., were presented with diplomas during the eighty-second annual commencement exercises at the New York Medical College, Flower and Fifth Avenue hospitals, June 5. The physicians are two of the nine surviving members of the class of 1892, and the diplomas marked their completion of fifty years in the practice of medicine.

**Thirty Years of Public Relations**—The committee on public health relations of the New York Academy of Medicine has published a report summarizing "its thirty years of service to the people of greater New York" since its establishment in 1911. The report covers the committee's activities on community health organization, prevention of disease and care of the sick, control of environment, child care, delinquency and crime, war problems and a number of other subjects relating to the city's health population.

**Directory of Tuberculosis Clinics**—There are twenty-six officially designated district clinics and forty non-district consultation and survey clinics serving New York City, according to the directory of tuberculosis clinics compiled by the New York Tuberculosis and Health Association. The directory, which is just off the press, gives the location of each clinic, the type of service given, the names of the physicians and nurses in charge and the medical social workers. Maps showing the boundaries for the Tuberculosis District Clinics are also included in the directory, copies of which may be obtained by writing to the New York Tuberculosis and Health Association, 386 Fourth Avenue.

**Venereal Disease Films for Men**—The bureau of social hygiene of the department of health announces that two new films are available for projection to audiences of men anywhere in the city. The films for laymen tell the facts about prophylaxis for syphilis, gonorrhea and other venereal diseases. The film "Know for Sure" was produced for the U. S. Public Health Service and "Health Tactics" for the Bureau of Medicine and Surgery of the U. S. Navy. Physician lecturers associated with industrial plants, schools and other organizations are invited to schedule these films in their health education program. Motion picture projection equipment and personnel are also provided.

### OHIO

**Surgeon Honored on Eightieth Birthday**—Dr John C. Oliver, professor emeritus of surgery, University of Cincinnati College of Medicine, was honored on his eightieth birthday, May 7, when the Elizabeth Gamble Deaconess Home Association and Christ Hospital dedicated their fifty-second annual report to him as a tribute to his long service to the hospital and to the city. Dr Oliver, who graduated at Miami Medical College in 1885, now known as the University of Cincinnati College of Medicine, is the only surviving member of the original group of eighteen staff members formed in 1885 at the Christ Hospital. He still serves as consultant in surgery.

**Dr Evans Receives Chemists' Medal**—William H. Evans, Ph.D., professor and chairman of the department of chemistry, Ohio State University, Columbus, was awarded the annual medal of the American Institute of Chemical Engineers meeting in Atlantic City, May 16, for "outstanding service."

the science of chemistry and the profession of chemists in America. Dr Evans received the award in recognition of accomplishments in the field of oxidation of organic compounds, particularly in the oxidation of carbohydrates. Dr Evans received his degree of doctor of philosophy at the University of Chicago in 1905, since then he has been a member of the Ohio faculty.

**Physicians Missing in War Area**—Newspapers report that Capt John A Marsico, formerly of Lorain, a member of the American forces in the Philippines when Corregidor fell, May 7, is 'missing in action'. According to the report, the war department will consider the persons serving in the Philippine Islands as 'missing in action' from the date of the surrender of Corregidor until definite information to the contrary is received. Captain Marsico is said to have been serving in the Philippines for the past eighteen months. Major James H Bahrenburg and Capt Mark G Herbst, Canton, were reported missing, May 23. It was believed that both physicians were on the Bataan peninsula when it was surrendered to the Japanese.

#### PENNSYLVANIA

**Society News**—Dr Joseph H Barach, Pittsburgh, addressed the Clearfield County Medical Society in Clearfield, May 21, on "Clinical Consideration of Functional and Organic Diseases of the Blood Vessels".—A joint meeting of the Reading Eye, Ear, Nose and Throat Society and the Reading Dental Society, May 20, was addressed by Dr Robert Henry Ivy, Philadelphia, on "Plastic and Maxillofacial Surgery".—Dr Eldridge L. Elason, Philadelphia, addressed the Delaware County Medical Society at the Chester Hotel, Chester, June 11, on "Man and His Gallbladder".—Dr Irwin M Pochapin, Pittsburgh, addressed the Washington County Medical Society, Washington, June 17, on "Medical Aspects of Chemical Warfare".

#### Philadelphia

**Scarlet Fever Quarantine Lifted**—A scarlet fever quarantine, in effect at the Philadelphia State Hospital at Byberry since March 6, has been lifted, newspapers reported on June 5. The quarantine was imposed because of the prevalence of the disease in Philadelphia. The report stated that 4,089 cases had developed in Philadelphia up to June 5 this year as compared with 2,320 during the same period in 1941. The removal of the quarantine from the hospital permits visitors for the first time since March 6.

**College of Pharmacy Commencement**—Dr Hubley R. Owen, city director of public health, gave the principal address at the one hundred and twentieth annual commencement of the Philadelphia College of Pharmacy and Science, May 27. His subject was "Keeping Fit for Victory". An honorary degree of doctor of science was awarded among others, to Dr Randle C. Rosenberger, professor of preventive medicine and bacteriology at Jefferson Medical College of Philadelphia. At the alumni homecoming the preceding day the presidential address was delivered by Dr Henry H. Perlman, Philadelphia.

#### VIRGINIA

**The Horsley Prize**—Dr James W. Watts, associate professor of neurosurgery, George Washington University School of Medicine, Washington, D. C., received the John Horsley Memorial Prize in medicine, May 4, for his paper on "Psychosurgery," written in association with Dr Walter Freeman, Washington. The award carries a stipend of \$600 and is presented every two years by the University of Virginia, Charlottesville. The president and visitors research prize was awarded to Walton C. Gregory, M.A., Amherst, research worker in biology at the university, and Arthur W. Jones, LL.B., Norfolk, won the \$50 Andrew Fleming prize in biology, given annually to a graduate student.

**Gifts to University of Virginia**—More than \$500,000 will go to the University of Virginia Department of Medicine, Charlottesville, under specific bequests and pledges, according to a recent announcement. Under the will of the late Mr. William James Rucker, Charlottesville, \$25,000 was left to the medical school for research in etiology and treatment of arthritis. One third of the residual estate estimated at more than \$1,000,000 will go to the University Hospital. The other two thirds is to be divided between the Martha Jefferson Hospital and Sanitarium, Charlottesville, and St. Luke's Hospital, St. Louis. Under the will of Dr. William E. Hopkins, Los Angeles, the medical school has received \$13,432 for the purchase of medical books and journals for the medical school library. On the death of Dr. Hopkins' widow, the residuary estate of about \$125,000 will go to the medical school. Dr.

Stephen H. Watts, professor of surgery at the school from 1907 to 1928, has established an endowment fund for the purchase of books and periodicals for the library. The McIntyre Tumor Clinic at the university will receive the residue of the \$11,000 estate of the late Nancy Vance for the treatment and terminal care of persons with incurable cancer. The John and Mary R. Markle Foundation has given \$2,000 to support further investigations on heparin in relation to peritoneal adhesions and other tissue reactions under the direction of Drs. Edwin P. Lehman and Floyd E. Boys, and the National Research Council has granted \$2,000 to the department of physiology for work in endocrinology under the direction of Dr. Sydney W. Britton. The department of syphilology and dermatology has been given \$3,600 by E. R. Squibb and Sons for the study of a new arsenical in the treatment of syphilis over a three year period.

#### WEST VIRGINIA

**State Meeting to Be in Huntington Instead of Sulphur Springs**—The state medical association announces that the state medical meeting will be at the Prichard Hotel, Huntington, instead of at White Sulphur Springs. The date remains the same, July 13-15.

#### GENERAL

**Phillips Memorial Medal Awarded**—The John Phillips Memorial Medal of the American College of Physicians was awarded jointly to the late Dr. James D. Trask and to Dr. John R. Paul, who is associate professor of medicine at Yale University School of Medicine, New Haven. Dr. Trask died on May 24, 1942. Dr. Paul graduated at Johns Hopkins University School of Medicine, Baltimore, in 1919 and has been at Yale since 1928.

**National Maternal Council Suspends Activities**—Because of lack of funds the National Maternal and Child Health Council, formerly National Council for Mothers and Babies, Washington, D. C., will suspend activities, although the council will continue as a corporation for the present. It is announced. A fund to finance the council through contributions from its constituent members has failed, and support from foundations could not be assured.

**Kober Medal Goes to Dr. Van Slyke**—Dr. Donald D. Van Slyke, chief chemist at the Rockefeller Institute Hospital, New York, was presented with the George M. Kober Medal, May 6, during the annual meeting of the Association of American Physicians in Atlantic City. The award, which is given for outstanding service to medicine, was presented to Dr. Van Slyke for his "contributions to the treatment of diabetes and Bright's disease, as well as for his work toward oxygen treatment of pneumonia." Dr. Van Slyke was born in Pike, N. Y., in 1883. He received his Ph.D. degree at the University of Michigan, Ann Arbor, in 1907 and his degree in medicine at the University of Oslo in 1938. He has been research chemist for the Rockefeller Institute since 1907 and chief chemist at its hospital since 1914.

**Report on Prevention of Blindness**—The National Society for the Prevention of Blindness expended almost \$164,000 in 1941. A new program instituted during the year was a glaucoma demonstration project in connection with clinic procedures. Fifteen hospitals in New York are participating by organizing special services for glaucoma patients. During the year the society extended its services to many groups interested in sight conservation, cooperated in sight-saving classes and sponsored a four month course at the George Warren Brown Department of Social Work, Washington University, St. Louis. Recommendations for statewide programs were made by the society at the invitation of the Maine commissioner of health and welfare and the Louisiana commissioner of public welfare. The society made 750 broadcasts in 1941 and used such other means as newspapers, magazines, exhibits and film showings to reach the general public. More than 25,000 pamphlets were distributed.

**Conference on Tomorrow's Children**—The third New England Conference on Tomorrow's Children will be held in Cambridge, Mass. July 8-10 under the auspices of the Harvard Summer School and twenty-seven cooperating organizations. As in the first two conferences, the program this year will deal with various phases of child, family and population problems in relation to the war crisis of modern society. The program is designed to be of special interest to workers in the fields of health, social work, education, religion, family relations, eugenics and social and economic planning. The opening session will be devoted to "The Family in the World Crisis of Democracy." In the afternoon there will be symposiums on "The Family and the New World Order," "Nation and Family

and "Family Living and Community Life" There will also be roundtables on "Marriage and Family Relations in Wartime," "Child Development and Protection in Wartime" and "Social-Economic and Population Planning in Wartime"

**Research Fellowships Awarded**—The Finney-Howell Research Foundation announces that the following eight fellowships have been awarded for one year

Dr Julius B C Abels, to work at the Memorial Hospital for the Treatment of Cancer and Allied Diseases, New York

Dr Glenn Horner Algate, to work at the National Cancer Institute, Bethesda Md

Bernard E Kline, M.S. to work at McArdle Memorial Laboratory, University of Wisconsin Madison

Margaret Nast Lewis, Ph.D., to work at the Crocker Radiation Laboratory, University of California, Berkeley

Alfred G Marshall, Ph.D. to work at Crocker Radiation Laboratory, Glasgow, Scotland

Rose I Shukoff, to work at the Glasgow Royal Cancer Hospital, Glasgow, Scotland

Emilia Vicari, A.M., to work at the Roseco B Jaelson Memorial Laboratory, Bar Harbor, Maine

Benjamin Norman Horowitz, Ph.D. to work at Harvard University, Converse Memorial Laboratory, Cambridge Mass

The Finney-Howell Research Foundation was created under the will of the late Dr George Walker, Baltimore, to support "research work into the cause or causes and the treatment of cancer"

**International College of Surgeons**—The National Assembly of the International College of Surgeons will be held at the Shirley-Savoy Hotel, Denver, July 15-18 Among the speakers will be

Dr Edwin C Henry, Omaha, Acute Abdomen

Dr Buen T King, Seattle A New and Function Restoring Operation for Bilateral Abductor Cord Paralysis

Dr Andre Crotti, Columbus, Ohio, Some of the Pitfalls in Thyroid Surgery

Dr Manuel Manzanilla A, Mexico City, Surgery of Diabetes Mellitus

Dr Elmer Hess, Erie, Pa., Treatment of Tumors of the Upper Urinary Tract

Dr Thomas A Shallow, Philadelphia, Osteogenic Sarcoma with Report of Sixty Five Cases

Dr Edward V M Mastin, St Louis An Improved Operation for Repair of Inguinal Hernia

Dr Verne C Hunt, Los Angeles Surgical Consideration of Obstruction Lesions of the Common Duct

Dr Albert A Berg, New York, The Preservation of the Sphincter Ani in Radical Operation for Carcinoma of the Rectum

Dr Rudolf Nissen, New York Drainage into Alimentary Canal as Method of Choice in Operative Treatment of Puerperal Cysts and Fistulae

Dr Tom Bentley Throckmorton, Des Moines Iowa Psychotherapy in General Medicine and Surgery

Dr Harry H Everett, Lincoln, Neb., Certain Observations on Right Upper Quadrant Surgery

A military symposium will be the feature of the meeting

**Navy Awards E Pennant to Manufacturers of Medical Supplies**—In the U S fleet, service is recognized by granting to any unit which has particularly distinguished itself the privilege of displaying the letter E. If a ship surpasses all others in gunnery, an E is painted on the winning turret and all men who helped win the honor are accorded the privilege of wearing a white E on the sleeve of their dress uniform. If a ship has distinguished itself in engineering, the E is painted on the funnel and again the champion men are given the right to wear the E. There is no more coveted honor. The first All Navy E ever awarded to a pharmaceutical manufacturing company was presented on June 12 to John Wyeth & Brother, Inc., of Philadelphia, it was one of two made at the recommendation of the Bureau of Medicine and Surgery of the Navy, the other award having been made to Johnson & Johnson of New Brunswick, N J, manufacturers of medical supplies

At the ceremony of award to John Wyeth & Brother Robert L Johnson, president of Temple University, was toastmaster, the speakers were Rear Admiral Charles M Oman, Medical Corps, U S Navy, Senator James J Davis, Representative Leon Sacks, Mayor Bernard M Samuel, Mr Frank F Law and Mr Alfred Barol, president and vice president respectively of John Wyeth & Brother. In his address, Admiral Oman said "It is the custom of the Navy to recognize service in whatever capacity it is to be found. Your contributions, which can be considered only in terms of the alleviation of human sufferings, are beyond price. It is of the merciful work that your medicines have done in our great sea battles, such as Coral Sea and Midway, that we like to think. A man wounded, in pain, is a man demobilized. A sound man, quickly healed after being put out of action, is one more strong hand to man the guns. Your drugs have helped to heal the wounded and to put them back into the battle full of life—and fighting mad, so we have brought the Navy E ashore, and it is my privilege to present the pennant to you today"

The award was made for a period of six months, at the end of which time the company's record will be reviewed again by the Navy and, if performance merits continued recognition, the

right to fly the Navy E will be granted for an additional six months, and every six months the company's record will be similarly reviewed. John Wyeth & Brother, which was founded in 1860, has supplied the armed forces with pharmaceuticals in the Civil War, the Spanish-American War, World War I and the present war

## FOREIGN

**Public Health Under Hitler's Rule**—*Donaueschingen* Belgrade, of April 25 cited an official announcement that there is a shortage of six thousand doctors for the front. It is also stated that the reference in *Universal* to 2,040 cases of typhus means nothing, as the yearly average for typhus is 3,621 cases.

*De Standaard*, Amsterdam, of March 24 reported that the burgomaster of The Hague has ordered that two gardens are to be devoted to the cultivation of medicinal herbs. One is to be at the Duinlaan near Kijkduin and the other between the Schenk and the railway to Leiden. Medicinal herbs will be grown which once had to be imported. The total area given over to this cultivation is to be about 40 hectares (100 acres).

*Donaueschingen* Belgrade, of April 23 reported that, thanks to the energetic efforts of the Ministry of Public Health, large quantities of vaccine have been imported and a great part of the population inoculated against typhus and cholera.

*Transocean* of April 24 reported that the Ministry of Health denied rumors alleging the existence of an epidemic (of typhus) in Athens and the Piraeus. It was stated that there had been a few cases, but not 1 has been serious. It also stressed that all hygienic measures had been taken to prevent the possibility of epidemics.

*Beilingske Aftenavis*, Copenhagen, of April 28 stated that the Esbjerg County Council's previous 8,000 kroner grant for delousing the citizens of Esbjerg has been increased by 7,000 kroner, as the work is more comprehensive than first expected.

*Transocean* of April 28 reported from Sofia that the public health authorities have registered during the past week 39 cases of typhus in the Shumen district of northern Bulgaria. They were mostly confined to gypsies and the epidemic is already abating.

*DNB* of May 4, 1942 states that addressing a meeting of the doctors and representatives of the other healing professions of the Gau Karnten in Klagenfurt, Reich Health Leader Dr Conti, who was accompanied by Gauleiter Dr Ramer, said that the birth rate in 1941 was evidence of the unbroken vitality of the German people. He announced that the number of births in 1941 was 1,528,000 live births, only slightly below the figure for 1940, which was a record year. In spite of the heavy war time tasks, the favorable development had continued, its significance could be fully estimated only by comparison with the figures for 1932 and 1933, when the number of births was considerably less than a million.

## CORRECTIONS

**Sulfonamide Resistance Developing During Treatment of Pneumococcal Endocarditis**—Dr Morton Hamburger Jr, senior author of the Clinical Note with the foregoing title in *THE JOURNAL*, May 30, requests the following correction of the third sentence in the second paragraph under the subtitle "Course" on page 409: "Sulfapyrazine was again administered, and after four days of treatment the blood became sterile. Treatment was continued for thirty-four days with blood levels of the drug maintained between 64 and 165 mg per hundred cubic centimeters."

**Federal and State Aid**—In *THE JOURNAL*, June 6, page 503 the medical economic abstract entitled "Federal and State Aid" stated that \$5,071,000 of federal funds were given to aid crippled children and \$3,739,000 of federal funds were given for maternal and child health. Dr Edwin F Daily, director of the Division of Health Services, Children's Bureau, U S Department of Labor, Washington, D C, writes that these figures should be reversed, that is \$5,071,000 was given for maternal and child health, and \$3,739,000 of federal funds were given to crippled children. The error was made, Dr Daily said by the U S Department of Commerce, which published the report "Federal and State Aid," 1941. These figures represent payments to the states from the federal treasury in a given fiscal year and are exclusive of payments to Hawaii, Alaska, Puerto Rico and the District of Columbia. The total amount of federal grants-in-aid paid to the forty-eight states, Alaska, Puerto Rico and the District of Columbia in 1941 was \$5,486,079 for maternal and child health services and \$3,091,000 for crippled children's services.

MAY 9, 1942

#### The Question of Adding Calcium to Bread

In August 1940 the Medical Research Council, on the advice of their accessory food factors committee recommended that white flour be replaced by a flour of greater extraction in order to save shipping and to improve the nutritional qualities of bread. They also recommended the addition of calcium carbonate, since cereals do not contain enough for the growing animal. Cereals also contain phytic acid, which prevents the body from making use of some of the other calcium in food by precipitating it in the alimentary canal and so preventing its absorption. Dr Israel Harris of the Research Institute, Liverpool, objects to the recommendation in the *Times*. There, he says, is no calcium shortage in the adult population. He also thinks that the addition may do harm, since it has long been established that calcium interferes with kidney function. Middle aged persons whose kidneys show weaknesses are bound to suffer. Children and pregnant women who require more calcium need other items as vital, and they can all be found in milk. Dr Harris also does not admit that the calcium content of bread is not readily absorbed.

Sir Edward Mellanby of the Medical Research Council states in reply to Dr Harris that the average person eats five sevenths of a pound of bread daily, in which the extra calcium would amount to 0.13 Gm, the amount contained in a sixth of a pint of milk. To say that this could injure the kidneys or blood vessels is absurd, especially in view of the war restrictions on the supply of milk to adults. The Food Rationing Advisory Committee of the Medical Research Council, composed of many well known scientists has assured the Ministry of Food that 'there is neither medical nor scientific evidence that the consumption of bread fortified by the addition of appropriate quantities of calcium salts is harmful to patients suffering from any type of disease.'

#### Increased Stocks of Food

Mr G. R. Whalley, principal assistant secretary of the cold storage division of the Ministry of Food speaking at a luncheon of the British Association of Refrigeration stated that our food stocks are 30 per cent higher than they were a year ago. This increase was no mean effort, considering how we had been cut off from our normal food supplies from other countries. A policy was being pursued of dispersing food stocks all over the country. The ministry had under direct control upward of six thousand warehouses for cold storage. He hoped that by the middle of the summer a substantial addition would be made to our cold storage capacity and he forecast a great development of the industry after the war.

#### Women's Work in the War

In this war, even more than in the last, women are playing a great part not only in taking the places of men who have joined the fighting services but in munition and other work auxiliary to those services. They are making an ever increasing contribution to what has become known as the Merchant Service of the Air. Last year these aircraft flew 5,500,000 miles and this year they will cover 8,000,000. The jobs performed by women range from architects, detailed designs for factory extensions, air raid shelters and other buildings to overhauling aero engines. They are beginning to be employed

at airports as traffic clerks. A rapidly growing number are being employed in the factories where aircraft engines and other components are overhauled and repaired. One woman has been trained to compute the time of sunset and sunrise in any part of the world, the duration of twilight and to make a reliable wind analysis.

#### Association of Austrian Physicians in Great Britain

The victims of Nazi oppression are now present in large numbers in Britain from all the enslaved countries, of which Austria was the first. They include many physicians. An association of Austrian physicians in Britain has been formed under the chairmanship of Prof. Friedrich Silberstein of Vienna University. The desire is to continue the great traditions of the Vienna medical school in the spirit of scientific progress such as was accomplished by Pirquet, Wenckebach, Chrostek and Landsteiner. The association is affiliated with the free Austrian movement and aims at the cooperation of Austrian physicians in the war effort. There are now three hundred and sixty Austrian physicians in Britain, of whom more than half are already engaged in work of national importance in hospital and other institutions.

#### A Great Medical Missionary Society

The Medical Missionary Auxiliary of the Church Missionary Society, the largest medical organization of this kind in the world, is celebrating its jubilee this year. In large areas of Africa and the East its hospitals, clinics and welfare centers are doing work which equals that of the twelve great voluntary hospitals of London. But the beginning of medical missions dates back much longer than fifty years. The Church Missionary Society sent its first missionary physician to the Maoris of New Zealand in 1836. Another landmark was the sending of the first physician by the society to Kashmir in India in 1865. From this small beginning came a chain of hospitals along the northwestern frontier, which have been centers of peace and good will among the tribes people. From its earliest stages the mission hospital has been a great reconciling agency. Time has shown that foes of long standing forget their feuds and live at peace within the hospital wards. Today the large mission hospital at Hangchow is carrying on its work among Chinese soldiers and refugees with the full consent of Japanese officials and is equally ready to treat Japanese patients. Medical missionaries look toward the future and are giving far more attention to preventive medicine and the raising of the general level of health by the teaching of hygiene and the spread of welfare clinics. With the spread of government medical services new plans of cooperation with them are being developed.

#### Social Biology in the War Effort

In a letter to the *Times* the president of the British Social Hygiene Council, Sir Walter Langdon-Brown and other officials of that body call attention to the importance of social biology at present. The falling birth rate and other problems of social biology have shown the need for a national movement to promote the application of existing biologic knowledge to current social problems. At the last meeting of the British Association for the Advancement of Knowledge it was proposed that an institute of social biology should be promoted forthwith as a consultative directive agency. The British Social Hygiene Council has been impressed with the adverse effect on the war effort of the failure to apply current knowledge to the problem of human relationships, personal anxieties and family instability. It regards this as a serious factor in the failure to obtain the nation's emotional drive toward a maximum efficiency. As a first step it proposes to convene a

national conference of the various interests—scientific and administrative—to consider how best social biology can be utilized in promoting the war effort and in safeguarding the future quality of the nation. Such a conference would help to integrate biologic knowledge and spiritual values into a system which would appeal both intellectually and emotionally to those responsible for the postwar social structure.

Restoration of Museum of Royal College  
of Surgeons

The destruction of the great museum of the Royal College of Surgeons by indiscriminate bombing has been described in previous letters. The immensity of the collection, the impossibility of securing storage elsewhere and the difficulty of securing transportation for it necessitated its retention in London. Special provisions made in reinforcing tunnels of the subbasement did not save valuable specimens. Most of the museum and part of the college were destroyed by a bomb which struck room V, the subadjacent war museum (of the last war) and tore rooms, utterly demolishing them and shattering room IV, the instrument and invertebrate rooms. Incendiaries completely gutted room III and the historical and mummy rooms. Fallen roof girders broke open the subbasement, exposing to destruction much of the stored material. The comparative osteology and physiology store rooms were completely destroyed. It was a disaster. The loss of numerous Hunterian specimens, of the expression of Hunter's distinctive attitude toward vital phenomena and of his sustained pioneer efforts to unravel their nature is irreparable.

Already preparations for the restoration of the museum, as far as that is possible, are advanced. At the suggestion of the anatomist Prof. Wood Jones, the University of Manchester has presented specimens prepared by the late Professor Watson to illustrate Hunterian ideals. The medical committees of the Royal Cancer Hospital and of St. Mark's Hospital (for diseases of the rectum) have presented specimens illustrating different forms of rectal disease. The Royal Australian College of Surgeons is arranging for hospitals throughout Australia and New Zealand to collect pathologic specimens commonly seen in those countries and rare in the British Isles. The Institute of Anatomy at Canberra has earmarked many duplicate specimens for transfer to England and has promised to organize after the war expeditions to collect specimens of rare marsupials and monotremes. The rector of the Egyptian university and the dean of the Faculty of Medicine have promised that Egyptian surgeons will collect specimens of diseases not encountered in Great Britain. After the war these will be presented as a token of gratitude for the hearty cooperation that has existed for many years between British and Egyptian surgeons, most of whom are fellows of the English college.

Health in the Factory

Though damaged by bombs, the London School of Hygiene and Tropical Medicine carries on and does much valuable war work. The war has produced a great expansion of industry and recruitment of thousands of women workers and has led to a great increase in the number of medical officers employed in industry. At the school about 100 from all over the country and from a wide range of industries attend lectures. Among the subjects of the lectures are "Nature and Prevention of Toxic Risks," "Nature, Prevention and Treatment of Occupational Skin Disease," "Factory Hygiene Assessment of Standards and Methods of Investigation," "Ophthalmology in Relation to Industrial Medicine" and "Protective Clothing and Appliances." Each lecture is followed by a discussion open to all.

BRAZIL

May 15, 1942

Diagnosis of Tuberculosis

Drs. Guilherme Lacorte and Estacio Monteiro of Oswaldo Cruz Institute, Rio de Janeiro, accomplished some research on the diagnosis of tuberculosis. They examined by various methods material suspected of being tuberculous from twenty-nine sources, some human beings and some lower animals. Microscopic examination gave the largest percentage of positive results, 61.6, followed by the taking of cultures with 45 per cent, inoculation with 37 per cent and examination of smears with 33 per cent positive results. Unfortunately, microscopic examination is unsuitable in the majority of cases, and inoculation has the disadvantage of causing a high death rate among the small animals used.

Dr. Newton Neves da Silva of Porto Alegre, Rio Grande do Sul, emphasized the value of Loewenstein's method of culture as a means of confirming a suspicion of tuberculosis. He said that it is better than the inoculation method, that cultures can be taken from different materials without delay and that they can be made repeatedly with ease.

From human specimens suggestive of tuberculosis, including sputum, urine, ascitic fluid, lymph nodes, pus, pleural liquid and gastric juice, Dr. Fontes Magarao and his co-workers of Rio de Janeiro obtained positive results in 43.8 per cent when using bacteriologic methods, that is, cultures and inoculations. Colonies developed in twenty to thirty days, while the inoculation of guinea pigs did not give positive results in less than two months after the injection.

Syphilis Among Workers

In a group of 3,700 workers in banks living in the city of São Paulo, Dr. Durval Rosa Borges found that 1,147 had signs of syphilis, i. e. 31 per cent of the total.

The diagnosis was made by four criteria

| Criterion                   | No. of Cases | Per Cent |
|-----------------------------|--------------|----------|
| Previous serologic reaction | 200          | 5.40     |
| History of chancre          | 29           | 0.78     |
| Clinical evidence           | 7            | 0.18     |
| Present serologic reaction  | 911          | 24.60    |

There are conflicting data in the city on the matter. Prof. Geraldo Paula Souza, director of the Instituto de Higiene, has found only 2.59 per cent of positive serologic reactions for syphilis among students of the University of São Paulo, while in the obstetric clinic of the same university Prof. Raul Briquet says that more than 50 per cent of the pregnant women present positive Wassermann reactions. Briquet's statistics refer to the poorer classes of citizens.

Anorectal Tuberculous Fistulas

In a paper on tuberculous anal fistulas, Dr. Jose Maria Caldas of Rio de Janeiro pointed out that the diagnosis can be made clinically. In a series of 66 fistulas, Dr. Caldas found that 19 per cent were tuberculous, 80 per cent of the patients were males. The author concluded that anorectal tuberculous fistulas are always secondary. The primary focus of tuberculosis is in the lungs in 100 per cent of the cases. While sometimes the patient appears to be healthy, he should nevertheless be sent to a lung specialist for search of a possible hidden primary focus.

Diagnosis of Paludism by Analysis of  
the Bone Marrow

In many parts of Brazil paludism exists as an endemic disease. Drs. Ulysses Lemos Torres and Jose de Paula e Silva of Escola Paulista de Medicina studied smears of the bone marrow obtained by sternal puncture. They concluded that sternal puncture is the best method to search for the parasite.

## Deaths

**Henry Gottlieb Steinmetz** ♂ Lansing Mich., Indiana University School of Medicine, Indianapolis, 1927, assistant physician at the Logansport State Hospital, Logansport Ind., from 1929 to 1934 and assistant superintendent from 1934 to 1937, served as medical director of public health of district number 6, Bloomington, Ind. from 1937 to 1939, taught the first course for nurses in public health administration at Indiana University in 1937 served as assistant medical director of public health in Arlington, Va. 1940-1941, acting health officer of Genesee County (Mich.) from 1941 until February 1942, when he became assistant director of the venereal division, Michigan Department of Health, served during World War I, member of the Medical Society of Virginia, American Psychiatric Association, American Public Health Association and the Michigan Public Health Association, received a master of public health degree from Johns Hopkins University, Baltimore, aged 45, died, April 22, of anesthetic shock.

**Duncan Cameron Walton** ♂ Medical Inspector, Commander, U S Navy, retired, Annapolis, Md., Johns Hopkins University School of Medicine, Baltimore, 1909, entered the Navy, April 12, 1910, and retired, Sept. 1, 1935, for incapacity resulting from an incident of service, served as commanding officer of the Marine Hospital at Quantico, Va., during World War I, in 1922 was assigned as chief, department of toxicology, at Edgewood Arsenal, Md. where he served until 1925, with a similar assignment from 1928 to 1931, formerly lectured on toxicology at the Naval Medical School, Army Medical School, Washington, D C, and the Naval Academy, member of the American Society for Pharmacology and Experimental Therapeutics and the Association of Military Surgeons of the United States, formerly associated with the Bureau of Medicine and Surgery in Washington, D C, aged 55, died recently in the U S Naval Hospital of coronary thrombosis, arteriosclerosis and hypertension.

**William Henry Best**, New York, University of Pennsylvania School of Medicine, Philadelphia, 1909, member of the Medical Society of the State of New York, deputy health commissioner of the city department of health since 1934, joined the health department in 1916 as a medical inspector and successively held the positions of borough diagnostician of Brooklyn, assistant sanitary superintendent and chief of the Brooklyn division of the bureau of preventable diseases and acting director, formerly assistant clinical professor of dermatology at the Long Island College of Medicine, served as a major in the medical department of the U S Army during World War I and at the time of his death was a lieutenant colonel in the medical reserve corps, aged 57, formerly visiting dermatologist to the Kings County Hospital, Brooklyn, consulting dermatologist at the Bushwick Hospital and the Hospital of the Holy Family, Brooklyn where he died June 3.

**Ralph Munson Beach** ♂ Brooklyn Columbia University College of Physicians and Surgeons, New York 1902 assistant clinical professor from 1930 to 1941 and since then professor of clinical obstetrics and gynecology at the Long Island College of Medicine, fellow of the American College of Surgeons served in various capacities on the staff of the Long Island College Hospital attending and consulting obstetrician from 1907 to 1928, Jewish Hospital attending obstetrician from 1907 to 1941 and chief obstetrician and gynecologist since 1941, Methodist Hospital, attending obstetrician and gynecologist from 1926 to 1928 Israel Zion Hospital chief obstetrician and gynecologist Williamsburgh Maternity Hospital, from 1910 to 1912 aged 61, died recently.

**Seymour Jerome Cohen** ♂ Chicago, Rush Medical College Chicago 1920, at one time assistant and associate in pharmacology at the University of Illinois College of Medicine served during World War I pharmacologist for the Municipal Tuberculosis Sanitarium formerly secretary of the Chicago Tuberculosis Society member of the American Society for Pharmacology and Experimental Therapeutics and the American Trudeau Society attending physician at the Michael Reese Dispensary aged 46 died, June 11 in the Michael Reese Hospital of uremia.

**Smith Augustus Spilman** ♂ Ottumwa Iowa Chicago Medical College 1879 member of the House of Delegates of the American Medical Association in 1926 an Affiliate Fellow of the Association fellow of the American College of Surgeons past president of the Iowa State Medical Society for-

merly surgeon for the Chicago, Milwaukee and St Paul and the Chicago, Burlington and Quincy and Wabash railroads, formerly surgeon and president of the staffs of the Ottumwa and St Joseph's hospitals aged 89, died, April 11, of coronary occlusion.

**Walter Babcock Swift** ♂ Boston, Harvard Medical School, Boston, 1907, member of the New England Society of Psychiatry, past president of the National Society for the Study and Correction of Speech Disorder, assistant in neurology from 1911 to 1914 and instructor in neuropathology, 1914-1915, at the Tufts College Medical School, had been affiliated with the Massachusetts General, Boston City and Boston Psychopathic hospitals, author of 'Speech Defects in School Children and How to Treat Them', aged 73, died, May 3 of pneumonia.

**Mark Eugene Lott**, Dallas, Texas, University of Texas School of Medicine, Galveston, 1904, professor of clinical surgery at the Baylor University College of Medicine, member of the State Medical Association of Texas and the American Association for the Surgery of Trauma fellow of the American College of Surgeons, member of the American Board of Surgery, served as a lieutenant colonel in the medical department of U S Army during World War I, on the staff of the Baylor University Hospital, aged 63, died, April 26.

**Charles Sweetser Benson** ♂ Haverhill, Mass. Columbia University College of Physicians and Surgeons, New York, 1896, fellow of the American College of Surgeons, past president of the Essex North District Medical Society, vice chairman of the medical advisory board of the Selective Service System, draft board physician during World War I, medical director of the Benson Hospital and Clinic, formerly member of the school committee, aged 69, died, April 30, of coronary thrombosis.

**Constantine Popoff** ♂ Haverhill, Mass. Harvard Medical School, Boston, 1910, member of the American Board of Radiology, Inc., New England Roentgen Ray Society, Radiological Society of North America, Inc., and the American College of Radiology, on the staffs of the Amesbury (Mass.) Hospital and Haverhill Municipal Hospital, on the draft board during the first and second world wars, aged 58, died, May 30, at his summer home in Hampton Beach, N H, of coronary thrombosis.

**Theodore Thompson** ♂ Shelbyville, Ill., Rush Medical College, Chicago, 1897, past president of the Shelby County Medical Society and the Central Illinois District Medical Society, at one time mayor of Shelbyville, served as a captain in the medical department of the U S Army during World War I, formerly member of the board of education formerly on the staff of the Decatur and Macon County Hospital, Decatur, aged 69, died, April 18, of heart disease.

**Hubert Spencer Steenberg** ♂ U S Army, retired, Milwaukee, Milwaukee Medical College 1902, entered the medical department of the U S Army as a captain on Sept. 17, 1920 and was retired on June 20, 1929 for disability not incident to the service served with the Wisconsin National Guard in Puerto Rico during the Spanish-American War and as medical officer during World War I, aged 65, died, April 26 in the Veterans Administration Facility.

**Henry Joseph Hoye**, Providence, R I Johns Hopkins University School of Medicine, Baltimore, 1899, member of the Rhode Island Medical Society, fellow of the American College of Surgeons, for many years medical director of the state unemployment relief commission associate surgeon St Joseph's Hospital consulting surgeon Rhode Island Hospital, aged 68, died April 26 of diabetes mellitus and arteriosclerotic heart disease.

**Robert Grisham Reaves** ♂ Knoxville Tenn., University of Virginia Department of Medicine Charlottesville 1915 member of the American Academy of Ophthalmology and Otolaryngology, member of the American Board of Otolaryngology, served in the medical department of the U S Navy during World War I, part owner of the Reaves-Leach Infirmary, aged 54, died April 25, in the Fort Sanders Hospital of typhoid.

**Jason Newell Robertson**, Wolcott N Y University of Vermont College of Medicine Burlington 1877 member of the Medical Society of the State of New York, past president of the Wayne County Medical Society served for many years as health officer for the village and town of Wolcott past president of the board of education of Wolcott medical member of the draft board during World War I aged 88 died April 7.

**George W. Miel** © Denver, Jefferson Medical College of Philadelphia, 1883, an Affiliate Fellow of the American Medical Association, past president of the Medical Society of the City and County of Denver, at one time treasurer of the Colorado State Medical Society, for many years staff surgeon for the Santa Fe Railroad, served at various times as chief and as president of the staff of St. Anthony's Hospital, aged 82, died, April 5.

**Percival Gordon White** © Los Angeles, McGill University Faculty of Medicine, Montreal, Que., Canada, 1905, fellow of the American College of Physicians, served as a major in the medical department of the U. S. Army in France during World War I, on the staff of the California, Cedars of Lebanon and Good Samaritan hospitals, a founder of the Moorcroft White Clinic, aged 61, died, April 28.

**David Crooker Dow**, Cambridge, Mass., Tufts College Medical School, Boston, 1898, member of the Massachusetts Medical Society, for many years medical examiner of the first Middlesex district, served as a lieutenant in the U. S. Navy during World War I, for many years on the staff of the Cambridge City Hospital, aged 67, died, May 27, of cerebral hemorrhage.

**James Prentiss Aylen**, Fargo, N. D., Bellevue Hospital Medical College, New York, 1888, member of the North Dakota State Medical Association and the Western Surgical Association, fellow of the American College of Surgeons, formerly superintendent of the Grafton (N. D.) State School, consultant for the Northern Pacific Railway, aged 78, died, April 29.

**Howard Wesley Hassell**, Bridgeport, Pa., Jefferson Medical College of Philadelphia, 1893, member of the Medical Society of the State of Pennsylvania, past president of the Montgomery County Medical Society, medical director of Bucks and Montgomery counties, formerly physician for the Eastern State Penitentiary, Philadelphia, aged 72, died, May 24.

**Hillis Hall Hattery**, Pendleton, Ore., College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1904, served overseas as a captain in the medical department of the United States Army during World War I, aged 61, died, April 25, in St. Anthony's Hospital of hypertensive cardiorenal disease.

**Charles Jaeger**, Denver, Missouri Medical College, St. Louis, 1888, member of the Colorado State Medical Society, a founder, a member of the advisory board and for many years president of the staff of the Presbyterian Hospital, on the staffs of the Children's, St. Joseph's, Denver and St. Luke's hospitals, aged 78, died, June 5.

**Sherman Perry** © Winchendon, Mass., Harvard Medical School, Boston, 1907, member of the New England Obstetrical and Gynecological Society, past president of the Worcester District Medical Society, on the staffs of the Henry Heywood Memorial Hospital, Gardner, and the Millers River Hospital, aged 63, died, April 20.

**Paul Eugene Payne**, Columbia, S. C., University of Georgia Medical Department, Augusta, 1919, member of the South Carolina Medical Association, served during World War I, health officer of Columbia, aged 45, died, May 4, in the Columbia Hospital of lobar pneumonia, cirrhosis of the liver and diabetes mellitus.

**John Fitzgerald Ryan**, Rock Springs, Wyo., University of Colorado School of Medicine, Denver, 1934, formerly instructor of pathology at the Tulane University of Louisiana School of Medicine, New Orleans, aged 34, died, April 27, at the Wyoming General Hospital of the effects of a lethal drug, self administered.

**James Clinton Willis** © Shreveport, La., Vanderbilt University School of Medicine, Nashville, Tenn., 1887, fellow of the American College of Surgeons, past president of the Louisiana State Medical Society, chief surgeon, Tri-State Hospital, aged 77, died, April 26, in the Colonial Hospital, Rochester, Minn.

**Benjamin Charles Pilkey**, Huron, Ohio, College of Physicians and Surgeons, Baltimore, 1896, served as a first lieutenant in the medical department of the U. S. Army during World War I, formerly county health officer, aged 75, died, April 24, in the Samaritan Hospital, Ashland, of chronic organic heart disease.

**Frederick Eugene Vaughan** © Mount Kisco, N. Y., Albany (N. Y.) Medical College, 1909, member of the county board of health, fellow of the American College of Surgeons, on the staff of the Northern Westchester Hospital, aged 57, died, April 14, of cerebral hemorrhage, arteriosclerosis and hypertension.

**William Joseph Delahanty** © Worcester, Mass., Dartmouth Medical School, Hanover, N. H., 1883, for many years trustee of the Worcester State Hospital and on the staffs of the Worcester City Hospital and St. Vincent Hospital, where he died, May 10, of arteriosclerosis and gangrene of the feet, aged 84.

**Edwin Abner Sayers**, Nashville, Tenn., University of Nashville Medical Department, 1908, member of the Tennessee State Medical Association and the American Association for the Surgery of Trauma, formerly on the staff of the Nashville General Hospital, aged 55, died, April 24.

**Henry Martyn Field** © Norwood, Mass., Harvard Medical School, Boston, 1904, served overseas in the medical department of the U. S. Army with rank of lieutenant colonel, on the staff of the Norwood Hospital, aged 66, died, May 20, of coronary occlusion.

**Irwin Alexander H. Bottenhorn**, Columbus, Ohio, Starling-Ohio Medical College, Columbus, 1909, also a dentist, professor of dentistry, College of Dentistry, Ohio State University, aged 59, died, April 7, in the White Cross Hospital of heart disease.

**Claude Allen Symons**, Memphis, Tenn., University of Tennessee College of Medicine, Memphis, 1914, served overseas as a first lieutenant in the medical department of the U. S. Army during World War I, aged 52, died, April 15, of coronary occlusion.

**Bruce E. Miles**, St. Joseph, Mo., Ensworth Medical College, St. Joseph, Mo., 1902, member of the Missouri State Medical Association, on the staff of State Hospital number 2, aged 65, died, April 21, in a hospital at Kansas City of coronary occlusion.

**James Franklin Scrivner**, Irvine, Ky., University of Louisville Medical Department, 1892, member of the Kentucky State Medical Association, formerly member and chairman of the board of education, aged 71, died, April 13, of chronic nephritis.

**William Ransom Campbell**, East Smithfield, Pa., Eclectic Medical Institute, Cincinnati, 1897, member of the Medical Society of the State of Pennsylvania, formerly a captain in the medical corps of the regular U. S. Army, aged 71, died, April 27.

**Morris Daniel Silver**, Detroit, University of Missouri School of Medicine, Columbia, 1901, College of Physicians and Surgeons, Baltimore, 1902, aged 61, died, April 26, in the Grace Hospital of hypertension and cerebral hemorrhage.

**Albert Fowler Rodrick**, Swampscott, Mass., Tufts College Medical School, Boston, 1901, served during the Spanish American War and World War I, aged 69, died, April 30, in the U. S. Naval Hospital, Chelsea, of coronary thrombosis.

**Albert Gallatin Stevens**, Cape May, N. J., Hahnemann Medical College and Hospital of Philadelphia, 1892, at one time mayor of West Cape May, for many years health officer, aged 72, died, April 17, of myocarditis and arteriosclerosis.

**Myron M. Metz**, Williamsville, N. Y., University of Buffalo School of Medicine, 1896, member of the Medical Society of the State of New York, vice president of the New York State Health Officers' Association, aged 71, died, April 6.

**John Ross Martin**, Huntsville, Texas, Kansas City (Mo.) Medical College, 1899, member of the State Medical Association of Texas, county health officer, served during World War I, aged 65, died, April 30, of carcinoma of the colon.

**Thomas Albion Stoddard** © San Francisco, University of California Medical Department, San Francisco, 1907, member of the American Academy of Orthopaedic Surgeons, formerly health officer of Santa Barbara, aged 62, died, April 7.

**George Walter Rogers**, Dauphin, Man., Canada, Manitoba Medical College, Winnipeg, 1905, past president of the Manitoba Medical Association, aged 67, died, April 28, in the Dauphin General Hospital of chronic myocarditis.

**Bernard William Mast**, La Crosse, Wis., Chicago College of Medicine and Surgery, 1910, member of the State Medical Society of Wisconsin, on the staff of the Grandview Hospital, aged 57, died, April 29, of cerebral hemorrhage.

**Paul Best Yates** © Columbus, Ohio, Ohio State University College of Medicine, Columbus, 1935, assistant professor of anatomy at his alma mater, aged 40, died, April 2, of injuries received in an automobile accident.

**John William Wilkins**, Mount Olive, N. C., Medical College of Virginia, Richmond, 1913, member of the State Society of the State of North Carolina, aged 55, died, April 25, in a hospital at Goldsboro of pneumonia.

Orvel Addison Suttle, Mount Vernon Ill Barnes Medical College, St Louis, 1909 served as a major in the medical department of the U S Army during World War I aged 70 died April 23 of angina pectoris

John Louis Morris @ Princeton, Ind Jefferson Medical College of Philadelphia 1896 past president of the Gibson County Medical Society formerly county coroner, aged 73, died April 24 of coronary occlusion

Freeman Hubert Sanders Spartanburg S C, Atlanta Medical College 1915 member of the South Carolina Medical Association aged 50 died April 3 in the Spartanburg General Hospital of gastric hemorrhage

Reuben Dorsey Williamson Castroville Texas Memphis (Tenn) Hospital Medical College 1898 member of the State Medical Association of Texas aged 66, died April 2, in the Santa Rosa Hospital, San Antonio

James Monroe Sleicher, Chehalis Wash Gross Medical College Denver, 1888 Kentucky School of Medicine Louisville 1905, member of the Washington State Medical Association, aged 88, died April 6

Oscar Stenberg @ Spokane Wash Trinity Medical College Toronto Ont Canada 1902 on the staffs of the Sacred Heart Deaconess and St Lukes hospitals, aged 67, died, April 24, in Rochester, Minn

Isaac Rendall Strawbridge @ Philadelphia, Medico-Chirurgical College of Philadelphia 1903 on the staff of the National Stomach Hospital aged 62 died April 12, of hypertensive cardiovascular disease

Charles Huber, Harrison Ohio Medical College of Ohio, Cincinnati, 1881 formerly mayor of Harrison and member of the board of education aged 87, died, April 4, in the Deaconess Hospital Cincinnati

John Chesley Stewart @ Atlanta Ga Atlanta School of Medicine 1910, examining physician for the Selective Service System on the staff of the Grady Hospital aged 64 died, April 9 of angina pectoris

James Gwynn Staples @ Gorgas, Ala, University of Louisville (Ky) Medical Department 1901 aged 66 died, April 20 in a hospital in Birmingham of tumor of the right kidney, type undetermined

Paul Lindsay Scott, Toronto Ont Canada, University of Toronto Faculty of Medicine 1900 professor in the department of materia medica at the Ontario College of Pharmacy, aged 73, died, April 3

William Francis Logan, Kansas City Mo Kansas City Hahnemann Medical College 1911, veteran of the Spanish-American War and World War I aged 69, died, April 10, in St Luke's Hospital

Carl Sinclair Moore, La Grande Ore Jefferson Medical College of Philadelphia 1913, member of the Oregon State Medical Society, served during World War I, aged 53, died in April in Portland

Joshua Leon Yeagley, Waldron Mich, Toledo (Ohio) Medical College 1901 member of the Michigan State Medical Society aged 68 died, April 12 of injuries received in an automobile accident

Berta Wechsler, Columbus Ohio, Julius-Maximilians-Universität Medizinische Fakultät, Würzburg Bavaria Germany 1918, member of the Ohio Medical Association, aged 48 died April 16

Thomas Richard Kennerdell, Cleveland Western Reserve University Medical Department Cleveland 1909 served during World War I, on the staff of the Grace Hospital, aged 58, died, April 23

Richard E Howard, Fort Lauderdale Fla Lincoln (Neb) Medical College of Cotner University 1904 formerly professor of bacteriology and histology at his alma mater, aged 73, died April 7

Gertrude Broeksmit, Cedar Rapids Iowa Woman's Medical College of the New York Infirmary for Women and Children New York, 1882 aged 82, died, April 26 of coronary thrombosis

Jefferson D Hopper Jackson Tenn Kentucky School of Medicine, Louisville 1892 member of the Tennessee State Medical Association, aged 80 died April 22 of cerebral sclerosis

Isaac Harter Moore, Seattle University of Pennsylvania Department of Medicine Philadelphia 1878 member of the Washington State Medical Association aged 87 died April 12

Donald Stuart MacNaughton, Brooklyn Long Island College Hospital, Brooklyn 1903 member of the Medical Society of the State of New York, aged 63, died April 24

Neal Matlock @ Medora Ind Kentucky School of Medicine Louisville 1901 past president of the Jackson County Medical Society, aged 64 died April 27 of coronary occlusion

James Carlyle Johnstone, Imola Calif Loyola University School of Medicine Chicago 1917 aged 78 died, April 21 in the Napa State Hospital of chronic myocarditis

James Coleman Winn, Gilmer, Texas, Memphis (Tenn) Hospital Medical College 1913 owner of the Elmwood Sanitarium, aged 72, died, April 4, of coronary occlusion

Robert Smith Allen, Gunnison, Colo, Denver College of Medicine, 1900 member of the Colorado State Medical Society, aged 68 died April 14 of angina pectoris

Isabella Florence Kelso, Waterloo, Iowa, State University of Iowa College of Homeopathic Medicine, Iowa City, 1893, aged 86, died April 22 of heart disease

Hendery Allison @ Kingsville Texas, University of Louisville (Ky) Medical Department 1899 aged 66, died, April 21, of heart disease and cerebral hemorrhage

Louis J Smith, Cleveland, Western Reserve University Medical Department Cleveland 1887 aged 77, died, April 3, of coronary embolism and arteriosclerosis

Thomas Reading, Hatboro, Pa, Hahnemann Medical College and Hospital of Philadelphia 1888, aged 77, died, April 24, of carcinoma of the bladder

Frederick Carl Belzig, Chicago, Chicago College of Medicine and Surgery, 1914, member of the Illinois State Medical Society aged 52 died recently

Charles M Thruston, San Francisco, Louisville (Ky) Medical College 1890 aged 73, died March 16, of bronchopneumonia plevitis and cystitis

Emily Frances Wells, Burbank Calif, University of Michigan Department of Medicine and Surgery, Ann Arbor 1879 aged 87 died recently

Moses Carlisle Sycle, Richmond Va, University College of Medicine Richmond 1903, served during World War I aged 61, died March 24

Joel E Johnson, Joplin Mo, Vanderbilt University School of Medicine Nashville, Tenn, 1890, aged 77, died, March 27, in the Freeman Hospital

Edward Perrone Overby, East Point, Ga, Southern Medical College, Atlanta, 1883, aged 87, died, April 1 of cerebral hemorrhage

Sara Holmes Oram, Apalachin, N Y Hahnemann Medical College and Hospital, Chicago 1887, aged 82, died, April 7 of arteriosclerosis

Herbert Mason Maynard @ Ionia, Mich, Grand Rapids (Mich) Medical College, 1907, aged 64, died, April 27, of coronary occlusion

Doan Parks, Galesburg Ill Hahnemann Medical College and Hospital Chicago, 1890 aged 72, died April 29, of coronary thrombosis

William Patrick Morse, Princeton Ky, Hospital College of Medicine Louisville, 1907, aged 67, died April 24 of cerebral hemorrhage

John Lee Pickens, Pensacola Fla Meharry Medical College Nashville Tenn 1911, aged 56 died April 23, of myocarditis

B L Ousley, Christiana Tenn University of Tennessee Medical Department Nashville 1901, aged 69 died April 2

James W Yancey, Ward Ark (licensed in Arkansas in 1903) aged 81, died April 27 in a hospital at Little Rock

#### DIED IN MILITARY SERVICE

Joseph Anthony Macca, Forest Hills N Y, Georgetown University School of Medicine, Washington D C 1932 member of the Medical Society of the State of New York formerly on the staffs of the Mary Immaculate and Queens General Hospital Jamaica was called to active duty as a first lieutenant in the medical reserve corps of the U S Army in May 1941 was stationed at Camp Blanding Fla, and later at Fort Dix N J where he died May 29 of pulmonary embolism following an operation three weeks previously aged 37

### GRAY HAIR OR BALD HEADS

*To the Editor* —Among middle aged men it is rather uncommon to see a man who is both bald and gray. He is either bald, without grayness in the fringe of hair at the back of his head and at the temples, or he is gray with a good supply of hair all over his head. If he is both gray and bald it will be found that the baldness usually came first. Premature aging is likely to be present in such instances. Fairly young men may be gray or bald without other physical evidences of premature aging. A man may be quite old with numerous evidences of extreme senility and yet be neither gray nor bald.

For a number of years laboratory workers have noted that animals kept on synthetic diets became more or less gray and that the color of the hair returned to normal after certain of the so-called factors of vitamin B complex were added to the diets. Ralli and her associates placed a group of rats on diets deficient in the "filtrate factor" of vitamin B complex. Some of these rats were given only a small amount of sodium chloride, the others were given large amounts of sodium chloride. The fur of the rats on the low salt intake became gray, on the average, fifty-five days earlier than did that of the animals on the high salt diet.

While graying of the hair may be due to a vitamin deficiency, there is no evidence as yet to indicate that baldness is due to the same cause or causes as grayness. Whatever the cause of gray hair, it seems evident that it is not the same as the cause of baldness.

There is another type of grayness observed in the man who is gray at the temples only, he is rarely bald, but the hair at the top of his head may be thinner than normal. It is unusual to see a man under 55 who does not fall into one of these three groups: (1) bald on top, (2) gray without baldness, (3) gray at the temples and thinner on top.

Why does a woman often become gray but rarely bald?

Why is the man doing manual labor less likely to have white hair in the temporal region than the hard worked or worried businessman?

By what metabolic processes, endocrine, vitamin or neurogenic, are these changes induced? Would studies of groups of persons belonging to the bald, the gray or those gray only at the temples give a lead?

Calcium pantothenate, iodine and sodium chloride have been advocated in the treatment of graying of the hair. These remedies, however, seem to be of slight if any value in human beings. Nor has a worth while remedy for baldness yet been suggested.

Although little or nothing at present can be done to prevent the changes which bring about baldness or grayness, it can be predicted with a fair degree of accuracy that the man who is losing considerable hair from the top of his head will become bald before he is gray, that the one who is becoming gray all over his head will be slow in becoming bald, and that the man who becomes gray chiefly at the temples is not likely to become bald. Old age, of course, alters all these prognostications.

EDGAR G. BALLENGER, M.D., Atlanta, Ga

[NOTE—Obviously Dr Ballenger offers impressions unsupported by statistical data. In the solution to some of the problems he suggests may lie the keys to a better understanding of the processes of aging.—ED.]

### "TUBERCULOSIS AMONG MEDICAL STUDENTS"

*To the Editor* —In the May 16 issue of THE JOURNAL appears a current comment on "Tuberculosis Among Medical Students," and in the discussion the emphasis is placed on the environment of the students. Although "contact with patients" is mentioned, it seems to me that this is the chief source of tuberculosis in students who are clumsy and careless in their first approach to the ill but undiagnosed patient. I believe that it is in the second and third years particularly that tuberculosis has its greatest incidence among medical students. It is in this period that the student is struggling to acquire a technique in physical diagnosis.

As a teacher of physical diagnosis at Harvard Medical School I am amazed, startled and disgusted with the manner in which a young man with a stethoscope will allow a total stranger to cough directly into his face. Yet with each second year group I plead with the students that self protection is still the first law of nature.

In textbooks and lectures this aspect of our hazardous work is seldom presented in an impressionable way. A question I asked in the examinations this year was "Describe protective techniques employed by doctors in examining patients." The answers ranged from immunization to legal aid, but they all included rigid "self protection."

EARLE M. CHAPMAN, M.D., Boston

### "NONSPLINTING TREATMENT OF FRACTURES OF ELBOW JOINT"

*To the Editor* —I have read with a great deal of concern the article appearing in the March 21 issue of THE JOURNAL by Dr. A. A. Neuwirth, entitled "Nonsplinting Treatment of Fractures of the Elbow Joint."

It seems that in these times it will be unavoidable that a great many traumatic conditions must be treated by many physicians who have not been especially trained in this line of procedure. For this reason I think it is particularly important that the undoubted advantage incident to anatomic reposition should not be unduly minimized. Certain it is that it is not always possible to obtain anatomic reposition, but equally certain it is that, if anatomic reposition can be obtained without interference with function, this should be the goal, particularly in growing children.

I question very seriously the advisability of oversimplification of the problem of treating fractures about the elbow and of the advisability of lumping them all into one group. One may admit that a series of 6 cases, however fortunate the end result, hardly justifies the categorical statement "It is my opinion that the nonfixing type of treatment in fractures of the elbow may be applied in all cases with profit and with greater retention of normal function and should be the rule, with fixation and splinting the exception."

It may well be that nonsplinting may be the answer to certain types of fracture of the elbow. Certainly, I believe that there are many types of fractures to which it will not apply. I hope that it will not be adopted indiscriminately until further research has been carried out as to its indication and value.

D. H. O'DONOGHUE, M.D., Oklahoma City  
Assistant Professor of Orthopedic Surgery, University of Oklahoma School of Medicine

## Medical Examinations and Licensure

### COMING EXAMINATIONS AND MEETINGS

#### BOARDS OF MEDICAL EXAMINERS

##### BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Examinations of boards of medical examiners and boards of examiners in the basic sciences were published in THE JOURNAL June 20, page 671

#### NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS *Part III* Various centers, June or July Exec Sec Mr Everett S Elwood 225 S 15th St, Philadelphia

#### EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF DERMATOLOGY AND SYPHILOLOGY *Oral Groups A and B* Cleveland Jan 14-15 1943 Final date for filing application is Dec 7 *Written* Various centers Nov 16 Final date for filing application is Oct 5 Sec Dr C Guy Lane, 416 Marlboro St, Boston

AMERICAN BOARD OF INTERNAL MEDICINE *Written* Oct 19 Final date for filing application is Sept 1 Sec, Dr William S Middleton, 1301 University Ave, Madison Wis

AMERICAN BOARD OF OPHTHALMOLOGY *Oral* Chicago, Oct 9-10 Sec Dr John Green 6830 Waterman Ave, St Louis

AMERICAN BOARD OF ORTHOPAEDIC SURGERY *Oral and Written* Chicago Jan 9-10 Final date for filing application is Nov 1 Sec, Dr Guy A Caldwell 3503 Prytania St New Orleans

AMERICAN BOARD OF PATHOLOGY *Oral and Written* Richmond Va, Nov 9-10 Final date for filing application is Sept 1 Sec Dr F W Hartman Henry Ford Hospital Detroit

AMERICAN BOARD OF PEDIATRICS *Written* Locally Sept 18 *Oral* Chicago Nov 23 Final date for filing application is July 1 Sec Dr C A Aldrich 707 Fullerton Ave Chicago

AMERICAN BOARD OF PSYCHIATRY AND NEUROLOGY New York December Final date for filing application is Oct 1 Sec, Dr Walter Freeman 1028 Connecticut Ave NW, Washington, D C

AMERICAN BOARD OF SURGERY *Part I* Oct 7 Final date for filing application is Aug 22 Sec. Dr J Stewart Rodman 225 S Fifteenth St, Philadelphia

AMERICAN BOARD OF UROLOGY If a sufficient number of applications are received an examination will be held in the east at the same time or shortly after one of the national meetings Sec, Dr Gilbert J Thomas 1409 Willow St Minneapolis

### Vermont February Report

The Vermont State Board of Medical Registration reports the oral and written examination for medical licensure held at Burlington, Feb 10-12, 1942 The examination covered 12 subjects and included 90 questions An average of 75 per cent was required to pass Five candidates were examined, all of whom passed Three physicians were licensed to practice medicine by endorsement The following schools were represented

| School   | PASSED | Year Grad | Number Passed |
|--|--------|-----------|---------------|
| Harvard Medical School                                   |        | (1940)    | 1             |

## Bureau of Legal Medicine and Legislation

### MEDICOLEGAL ABSTRACTS

**Malpractice Limitation of Actions in Relation to Unauthorized Operation**—An account for medical services given by defendant Dray was assigned to the Physicians' and Dentists' Business Bureau. In a suit on the account, the physician who rendered the services was made an additional defendant at the instance of Dray, who filed a cross complaint against the physician for damages. A demurrer to the cross complaint and to a subsequently filed amended cross complaint was sustained and Dray appealed to the Supreme Court of Washington.

The cross complaint alleged that the defendant Dray consulted the physician, who advised her to go to a hospital for a laboratory test, that at the hospital she was placed on an operating table and anesthetized, and that while under the influence of the anesthetic the physician performed "an operation upon her against her will and without her consent, in which he removed her uterus." The operation was performed in March 1936 and the cross complaint was filed Dec 1, 1938. The demurrer was sustained on the ground that the statute of limitations had run against the cause of action, the trial court holding that the cause of action stated was for an assault and battery which was barred by the two year statute of limitations applicable to such actions.

While an unauthorized operation is, in contemplation of law, an assault and battery, it also constitutes malpractice, the court said, even though negligence is not charged, and the general rule is that in the absence of a special statute of limitations malpractice actions are controlled by the limitations applicable to actions for damages generally. Courts which have recognized an unauthorized operation as an assault and battery have nevertheless held that, in contemplation of the statute of limitations, such an operation amounts to malpractice, the cause of action for which is subject to the statute of limitations applying generally to actions for damages to the person. When a plaintiff has several remedies for the same cause of action, the fact that one or more of his remedies have become barred will not affect his right to any of the others which are not barred. The statutes of Washington allow three years for the commencing of an action for damages for injuries to the person. Accordingly, the Supreme Court concluded that the cross complaint had been filed in time even though the two year statute for damages for an assault and battery had already run. Nor was the cause of action stated in the amended cross complaint barred although it was filed more than three years subsequent to the operation. While it is apparent, continued the court, that an attempt was made in the later complaint to set up a cause of action ex contractu, the cause stated still sounded in tort. No new cause of action having been set up, the statute of limitations did not bar the action even though the amended cross complaint was filed more than three years after the cause of action arose. The judgment of the trial court was therefore reversed and the cause remanded with direction to overrule the demurrer.—*Physicians' and Dentists' Business Bureau v Dray*, 111 P (2d) 568 (Wash., 1941)

**Harrison Narcotic Act Exempt Preparations Administered by Physician, Record Keeping Requirement**—The appellant, a licensed physician of Hawaii, administered preparations, such as paregoric and cough syrup, containing a limited amount of narcotics to patients whom he personally attended. Because he kept no records of such transactions, he was convicted of violating the Harrison Narcotic Act. The conviction was upheld by the United States circuit court of appeals, ninth circuit, and the case came before the United States Supreme Court for review.

Section 6 of the Harrison Narcotic Act, after exempting certain attenuated narcotic preparations from the act, contains the following proviso:

"Provided further, that any manufacturer, producer, compounder, or vendor (including dispensing physicians) of the preparations and remedies mentioned in this section lawfully entitled to manufacture, produce, compound, or vend such preparations and remedies, shall keep a record of all sales, exchanges, or gifts of such preparations and remedies."

Congress, in the opinion of the court, by the use of the words "dispensing physicians," meant to exclude physicians administering to patients whom they personally attend. That not all physicians are required to keep records was manifest to the court because of the use of the qualifying adjective "dispensing." A physician, to come within the record keeping requirement, must be one who manufactures, produces, compounds or vends the drugs, or possibly only one who vends if the parenthetical phrase applies only to "vendor." This construction, the court continued, was borne out by a consideration of the act as a whole. The word "administer" more appropriately describes the activities of a physician in personal attendance than does the word "dispense." Admittedly, the court pointed out, the words "dispense" and "dispensing" are used in several senses in the act, but Congress evidently was aware of the differentiation between "administer" and "dispense" for when it wished to include all possible functions of physicians with respect to drug distribution it used the two terms in conjunction. Furthermore, in dealing with true narcotics, Congress unequivocally exempted physicians from record keeping when in personal attendance on patients. It was difficult for the court to perceive why a different requirement should obtain when a physician, under similar circumstances, administers preparations containing only a limited amount of narcotics. A construction of the parenthetical phrase "(including dispensing physicians)" as encompassing only physicians who would be covered by the word "vendor" did not, the court said, imply that Congress was tautologic but rather that it acted cautiously to preclude any contention that physicians selling drugs were not "vendors" simply because of their professional status.

On all the evidence, the Supreme Court concluded that the physician was not a "dispensing physician" within the meaning of the proviso and that his failure to keep records of the exempt narcotic preparation he administered constituted no violation of the act. The judgment of conviction was reversed and the cause remanded for further proceedings.—*Young v United States*, 119 F (2d) 399, 62 S Ct 510 (1942)

## Current Medical Literature

### AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1932 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (\*) are abstracted below.

**Detecting Intestinal Protozoa.**—Six normally passed stools from each of 118 children were examined by Sawitz and Faust by the two direct and the zinc sulfate concentration techniques for intestinal parasites. Of the 708 specimens examined, Endameba histolytica was recovered from the specimens of 63 children, Endameba coli from 74, Endolimax nana from 100, Giardia lamblia from 91, Chilomastix mesnili from 53, Trichomonas hominis from 21, Diandameba fragilis from 6, and Iodameba butschli from 72. By the direct iodine or hematoxylin stained fecal film technique 52 of the possible 378 specimens were found positive for Endameba histolytica, that is, less than one in five. By their combination with the zinc sulfate centrifugal flotation technique about one out of three or four infections was detected in a single examination. The efficiency of the iodine or hematoxylin stained film for the nonpathogenic protozoa was one in four, but one of these techniques combined with zinc sulfate centrifugal flotation technique gave a probability of one in two.

**Diagnosis of Amebiasis by Culture Method.**—Tsuchiya submitted the stools from 100 patients with acute or chronic dysentery to the direct microscopic concentration and the cultural laboratory procedure. Of 14 acute cases the respective methods were diagnostic in 14, 14 and 13 and respectively in 72, 77 and 84 of 86 chronic cases. The chronic cases when broken down showed 15 clinical cases, 50 carriers with a large

number of cysts and 21 carriers with a few cysts, and the three procedures were diagnostic in 12, 13 and 15 of the clinical cases, in 49, 50 and 49 of first group of carriers, and in 11, 14 and 20 of the other carrier group. The culture method should be included in the routine examination of stools for Endameba histolytica. It increases the percentage of positives when employed with other methods and serves as a check on negatives otherwise obtained.

**Exophthalmometric Measurements.**—The degree of proptosis in various stages and types of exophthalmic goiter was determined by Galli-Mainini in 126 patients by actual exophthalmometric measurements. For control the eyes of 50 healthy persons were measured and the readings fell between 14 and 17.5 mm. All measurements over the latter figure were considered to be exophthalmic. The measurements of 13 patients with nontoxic nodular goiter, giving no past history of exophthalmos and not appearing to have it at the time of examination, ranged from 14 to 18 mm. Only 1 was above the higher range of normal. Those of 3 patients with toxic nodular goiter were between 15 and 22 mm. The measurements of 58 thyrotoxic patients with diffuse goiters, 40 of whom gave a history of exophthalmos and all of whom appeared to have it at the time of examination, ran from 18 to 25 mm. Twenty-one of 34 with spontaneous myxedema having actual measurements from 15 to 25 mm had definite exophthalmos by measure. The measurements of 4 with myxedema following thyroidectomies for toxic goiter without exophthalmos were within normal limits. All 14 with myxedema following thyroidectomy for toxic goiter with exophthalmos showed exophthalmos of 19 to 27 mm at the time of measurement.

#### Digitalis in Prevention of Recurrent Cardiac Failure

—Sokolow and his colleagues investigated the probability of digitalis preventing recurrent cardiac failure in a recovered ambulatory patient. Four patients who had previously had cardiac failure with a regular rhythm and who were compensated on the usual therapy were observed for thirty-one to sixty weeks. 3 had hypertensive heart disease and 1 had arteriosclerotic heart disease. Each was kept on a comparable controlled regimen of activity, salt, fluid and caloric intake. The only variable was the administration or the omission of digitalis. Cardiac failure always recurred when digitalis was withheld. Administration of digitalis tended to prevent the development of failure in patients with a regular sinus rhythm. Digitalis also proved of value in relieving the congestive failure that occurred when the drug was withdrawn. In 3 patients the cardiac reserve became so diminished that irreversible cardiac failure occurred in spite of treatment. The vital capacity, venous pressure response or venous pressure to compression of the right upper quadrant circulation time and weight when correlated with the clinical signs proved of value in determining

the trend of the circulatory status. Continuous digitalization is of value in preventing recurrent cardiac failure in ambulatory patients with regular sinus rhythm. It is not wise to omit giving digitalis to patients with diminished cardiac reserve who have had cardiac failure previously, even though they are free from symptoms.

**Treatment of Delirium Tremens**—Beikwitz used faradic shock for the treatment of 33 patients less than 55 years of age with uncomplicated delirium tremens following alcoholism. One electrocardiograph electrode was applied to the forehead and another to the back of the neck. A series of fifteen subconvulsive electrical shocks was given with a faradic current of half a second duration at intervals of half a second. The patient received an average current of about 10 milliamperes in each shock. Immediately after electrical shock an intravenous injection of 8 to 10 cc of a 5 per cent solution of pentothal sodium to produce general anesthesia for three to five minutes was given. For a few minutes after awakening the patient was usually confused and poorly coordinated. As the effects of the pentothal sodium wore off, the patient's apprehensiveness, hallucination and tremors diminished or were absent. Shock treatment was repeated daily until all apparent symptoms of delirium disappeared. Forty-three similar patients were given only the routine medical treatment. Among the 76 patients there was only 1 death of a patient who did not receive faradic shock treatment. The mean number of days that strong sedation was used by the group receiving shock treatment was two and eighty-one hundredths as compared with five and five hundredths days. After the first treatment strong sedation was needed only for six tenths of a day. This low figure strongly indicates the effectiveness of the treatment. Experience with the faradic treatment has shown that the necessary "protective" measures (chemical and physical restraints) often aggravate or prolong the condition. Shock therapy promptly removes the acute psychotic symptoms in most cases and consequently lessens the need for these undesirable protective measures.

**Cardiopericardiopexy**—Thompson and Raisbeck outline the technic of cardiopericardiopexy, or the production of adhesive pericarditis by introducing sterile talc into the pericardial sac. Animal experimentation has revealed that the pericardium is able to furnish a collateral circulation to the myocardium that is sufficient to overcome the ischemia produced by sudden complete ligation of a main branch of the coronary artery. Collateral myocardial circulation is produced by any or all of the following ways: (1) formation of new channels between the main coronary arteries, (2) dilation and proliferation of already existing intercoronary channels and (3) formation of new extracardiac channels from the newly adherent pericardium. The beneficial effects of this operation may be due to the formation of intracardiac collaterals resulting from the myocardial reaction as well as to the formation of new extracardiac collaterals from the adherent pericardium. Although the reaction subsides and the operative stimulation ceases, the original impetus may accelerate the process of spontaneous collateral formation to a rate equal to or greater than the occlusive process. Patients selected for this operation are those with a typical anginal syndrome related to effort, those with objective physical electrocardiographic and roentgen evidence of coronary and myocardial disease and those in whom improvement does not follow fairly prolonged medical treatment. A previous coronary occlusion is not considered a contraindication, but sufficient time must have elapsed to permit healing of the infarct and there must be no evidence of activity. A group of the author's patients who were completely incapacitated have been relieved of their anginal pain and have returned to their former occupation. The relief from angina is complete in some and partial in others. No patient has failed to show symptomatic relief and a definite increase in his exercise tolerance. Follow-up study (exercise tolerance, blood pressure, direct venous pressure, fluoroscopy and roentgen and electrocardiographic examination) does not reveal any evidence of cardiac compression or cardiac hypertrophy due to adhesive pericarditis. The simplicity of the operation and the benefits elicited appear to warrant further employment of the procedure.

**Artificial Fever for Juvenile Neurosyphilis**—Five patients of ages from 11 to 20 years were treated by Nielsen and his associates in the Kettering hypertherm. Four of them presented a picture of dementia paralytica and 1 a tabetic picture without the typical dementia paralytica colloidal gold curve of the spinal fluid. Four of the patients were given a complete course of artificial fever. This consisted of fifty hours of treatment in ten to eighteen sessions at a temperature of 105 to 106 F. One patient received an additional course of thirty hours about two and a half years after the first course. One patient died during the twelfth treatment. Necropsy showed the cause of death to be cerebral edema and subarachnoid hemorrhage. During fever therapy the patients received weekly intramuscular injections of bismuth subsalicylate and intravenous injections of mapharsen. The mapharsen was administered at the height of the fever. After the last fever treatment chemotherapy was continued for six weeks. After this, regular courses of arsenical and bismuth preparations were given up to the time of the report. The 4 surviving patients have been closely followed for one to three and a half years. At the time of writing the 3 patients with dementia paralytica are at home and all have shown definite improvement in both physical and mental activity. The condition of the tabetic after one year of improvement has remained stationary, except that the atrophy of his optic nerve has progressed to the point of blindness. The Wassermann reaction of 3 patients returned to normal immediately after therapy and of the tabetic patient after 1 year. The normal reaction of 1 of the patients became negative at a later date.

**Endogenous Allergy**—Endogenous allergy embraces types of hypersensitivity and hyposensitivity which result from allergens formed within the body. Urbach divides the endogenous allergens into two groups: the autoendogenous allergens which arise from altered endogenous substances as a result of atrophic, degenerative or other changes in the tissues, and the heteroendogenous allergens which are derived from heterogeneous protein from bacteria, fungi and parasites after multiplication or growth within the body. The category of autoendogenous allergy may include paroxysmal hemoglobinuria, autoagglutination, a syndrome resembling serum sickness from absorption of autogenous protein, a cutaneous auto-sensitization phenomenon, an autoanaphylactic ocular disease and menstrual allergy, pregnancy, hormone and physical allergy. The heteroendogenous allergies include certain acute exanthems, some acute arthritides and infestations. The recognition that autogenous substances, micro-organisms and parasites may act as endogenous allergens will induce the physician to search for them when an incriminating exogenous allergen cannot be found after thorough investigation. New diagnostic methods are necessary for identifying endogenous allergens. The test substances for such methods are uveal pigment, human milk, menstrual serum, urinary proteoses and undenatured bacterial antigens, and the determination of anti-hormones. The application of these principles will be of definite therapeutic value in dealing with allergies of endogenous origin.

**Rat Bite Fever**—Few diseases Brown and Nunemaker believe are in a more confused state with regard to etiology than rat bite fever. They review the subject and present evidence which suggests that *Streptobacillus Moniliformis* infection is induced with greater frequency by the bite of a rat than is *Spirillum minus* infection. There is good evidence that *Spirillum minus* causes an illness which may be indistinguishable from that produced by the streptobacillus. It has been

suggested that some patients may have been infected with both agents. The relative etiologic significance of the two micro-organisms in rat bite fever will be furthered by the proper search for both agents in future cases.

**Effect on Vital Capacity of Swift Ascent**—The effect on the vital capacity of the lungs of 4 subjects of lowering the barometric pressure by 2,000 to 3,000 feet per minute was studied by Eckman and Barach in a simulated altitude of 18,000 and 35,000 feet, before ascending and on descending at 18,000 feet and at sea level. The average observations with an unheated spirometer show an apparent fall in vital capacity of from 4,570 cc at sea level to 4,470 cc and 3,875 cc at pressures equivalent to an altitude of 18,000 and 35,000 feet, respectively. With a return to sea level a rise of from 3,875 cc at 35,000 feet, 4,500 cc at 18,000 feet and 4,755 cc at sea level occurred. The data with the heated spirometer show that the average fall was from 5,035 cc at sea level to 4,955 cc at 18,000 feet and 4,665 cc at 35,000 feet. The apparent decided fall in vital capacity at diminished barometric pressures was probably due to the precipitation of water vapor of the expired gases when they were cooled to room temperature. When correction for vapor tension and temperature was made, the fall was minimal. The minimal fall in vital capacity at barometric pressures equivalent to an altitude of 35,000 feet was probably due to an inadequate technique in measuring the changes in temperature in the gas collecting bells or to the expansion of gases in the intestine with the upward displacement of the diaphragm.

It is unlikely that the fall in barometric pressure at a high altitude decreases the pressure only on the outer surface of the pulmonary capillaries with consequent dilatation of these vessels and a resultant decrease in volume.

**Protection of Flying Personnel Against Extreme Temperature**—It is pointed out by Pmson and Benson that the designing of adequate clothing which will protect the flier presents two unusual aspects—the extremely low temperatures encountered in flight and the rapidly changing environmental conditions as changes in altitude are effected. The average decrease in temperature with each thousand foot increase in altitude is about 3.5 degrees F. Heating the cabin and the use of insulated or heated clothing have been tried. When the advantages and disadvantages of these three methods of protecting the flying personnel against the cold of high altitudes are considered, electrically heated clothing appears to be most adaptable and it may be used in combination with varying amounts of insulative clothing. Its advantages are that the heat supplied can be adjusted to the changing requirements, and the bulkiness of the clothing can be reduced to a minimum, permitting normal activity and efficiency. Its disadvantages are that protection is inadequate in case the power supply fails or in forced landing and abandonment of ship on a cold terrain, that a rather large amount of energy is needed for each suit at extremely low temperatures and that the normal mechanism responsible for heat balance may be upset to such an extent that the individual probably cannot make proper adjustments with respect to the correct supply of heat needed. Under such conditions the internal body temperature may fall 2 or 3 degrees without causing any undue feeling of discomfort and without eliciting the shivering reflex. Eventually shivering will occur as the result of central excitation and when it does occur it may be so severe as to impede the flier's normal performance of his duty. The application of heat to all surfaces of the body together with proper distribution of the heat with respect to intensity will minimize the aforementioned objections. With proper distribution and application of heat, decreases in internal body temperature can be prevented. Suitable protection for the face in heated clothing presents the same difficulties (restriction of vision and breathing) as when insulative clothing is worn.

**Brucellosis in Mexico**—The increasing number of patients with brucellosis applying for diagnosis or treatment at the General Hospital of Mexico City gave Ruiz Castaneda and his associates an opportunity for isolating and classifying a relatively large number of brucella strains. Of 200 patients with brucellosis submitted to the usual procedures, 83.5 per cent were probably infected in Mexico City and the rest in endemic regions in parts of the Republic. Eighty-four per cent of blood cultures were positive, as compared with 93 per cent of positive agglutination tests and 80 and 60 per cent, respectively, for the allergic and opsonic tests. About 10 per

cent of the 1940 cases gave negative serologic and allergic tests while *Brucella* was isolated from the blood. The classification of 150 strains of *Brucella* showed that 143 were *Brucella melitensis*, 5 *Brucella abortus* and 2 *Brucella suis*. The prevalence of *Brucella melitensis* in Mexico was corroborated by epidemiologic data pointing to the consumption of dairy products from goats as a main source of infection.

**Arthritis in Rats**—The fact that arthritis is a frequent complication of other diseases in animals known to be caused by the organisms of bovine pleuropneumonia and the mastitis of sheep and goats prompted Preston to report the isolation of pleuropneumonia-like microorganisms from spontaneous arthritis in rats, to produce experimental arthritis in them, to study its pathologic changes and to attempt to isolate similar organisms from patients suffering from rheumatoid arthritis. He studied the fluid aspirated from the joints of 19 patients with typical rheumatoid arthritis. From several patients more than 1 specimen of fluid was obtained for study. On no occasion was any organism related to the pleuropneumonia group obtained. The negative results agree with those of all other workers reporting similar studies.

**Pneumonectomy for Carcinoma of Lung**—Because of the relatively short time (the first successful pneumonectomy for pulmonary carcinoma was reported by Graham in 1932) during which carcinoma of the lung has been treated surgically, it is impossible to predict the ultimate place that surgical intervention will have in its treatment. The technical problems have been solved to a point which makes the operative procedure relatively small. With the advancement in operative procedure and improvement in diagnostic methods that are constantly taking place, Harrington believes that the results of surgical treatment will improve and that surgery will become the accepted treatment. Future improvement in results will come mostly on early diagnosis and immediate surgical treatment.

**Unexpandable Lungs**—About 5 per cent of therapeutic pneumothoraces terminate in unexpandable lungs. Among 318 patients receiving therapeutic pneumothorax during two years Farber encountered 27 with unexpandable lungs, in 5 of them a bronchopleural fistula was demonstrated. In the other 22 various etiologic factors were the cause for unexpansion: bronchial stenosis in 3, massive parenchymal fibrosis in 16, visceral pleural thickening due to long standing pyopneumothorax, oleopneumothorax or hydropneumothorax in 20, pleural adhesions in 3 and imperative collapse in 5. The dangers connected with the dead pleural space are empyema, tuberculosis, mixed infection and bronchopleural fistula. In this connection Churchill has warned against the danger of temporary collapse for a pulmonary process that requires permanent collapse, such as thoracoplasty. The early replacement of unsuccessful pneumothorax by permanent collapse might reduce the incidence of unexpandable lungs.

**Sulfathiazole Crystallization in Kidney**—Lindner and Atcheson report two fatal cases of complete anuria following sulfathiazole. The results of cystoscopy and necropsy are presented. When sulfathiazole is used the urine should be checked daily as to volume of fluid intake and output, hematuria, crystals, albuminuria and casts. The blood sulfathiazole level does not indicate the degree of crystallization. Sulfathiazole concretions are not radiopaque. The crystals may mechanically block the ureters but it is more likely that serious block occurs in the tubules. The best therapy is renal lavage with warm water through ureteral catheters supplemented by fluids, alkali and heat.

**Calcification of Vasa Deferentia**—Lowsley and Riaboff cite the thirty-second case of calcification of the vasa deferentia, ampullas of the vasa deferentia and the seminal vesicles. The reported cases have been divided into inflammatory and non-inflammatory groups in both of which the calcified tissue on microscopic examination appears as a hard mass sometimes of lichen-like consistency. The condition may occur at any age, from youth to senility; the youngest patient was 14 and the oldest 81. Of the 32 cases 21 were found at necropsy, 1 at operation and 10 including the authors' case were diagnosed in the living subject. The diagnosis is based on roentgen observations confirmed by vasography. Calcification of the vas should be differentiated from stones in the ureters and in the bladder. On rectal examination it should not be confused with a neo-

plastic growth. No symptoms are specific, but when a small stone is present in the lumen of the vas deferens it may manifest itself by an attack of spermatic colic-like pain and blood in the urine.

**Skeletal and Genitourinary Tuberculosis**—In a study by McLelland and Davis, a urine culture of 297 patients with skeletal tuberculosis revealed 66 with urinary tuberculosis. Urinary symptoms were absent in 42, mild in 18 and severe in only 6. In this way tuberculosis of the urinary tract was discovered some time before symptoms appeared. Of the 66 patients 27 are dead after an average of five years of observation. This death rate is practically twice that of complicated and uncomplicated skeletal tuberculosis. The authors conclude that a patient with a single skeletal tuberculous focus has an 18 per cent chance of having genitourinary tuberculosis, while the chance in 1 with multiple lesions is 32 per cent.

**Supernumerary Kidney**—Shane reports a case of supernumerary kidney which before operation was thought to be a duplication of the pelvis and ureter. Of the 40 cases reported in the literature the ureter was fused with the normal kidney in 15, was not fused in 13, ended as a blind sac in 1, was lacking in 2 and was present but not traced or described in 10. Four of the 13 supernumerary kidneys with separate ureters were ectopic. In the author's case the ureter opened into the vagina just beneath the urethra. It emphasizes that any child with enuresis should not be relegated to the group of 'bed wetters' until a complete urologic study is made. The author's patient complained of lack of bladder control, pyelitis and pregnancy. A general physical examination, a plain urinary roentgenogram and an excretory urogram revealed nothing unusual. Cystoscopic examination showed a normal bladder and two ureteral meatuses on the right side and only one on the left. The catheters were withdrawn after a pyelographic film was made and the cystoscope was reintroduced, when some urine spurted just beneath the urethra. Compression of the urethra against the cystoscope caused another spurt, allowing a small slit in a vaginal fold to be seen. A ureteral catheter was introduced into this orifice and with the cystoscope in the bladder a catheter was passed into the one ureteral meatus on the left side. The two catheters were injected with an opaque medium, and the pyelograms of the right side were interpreted as a reduplication of the pelvis and ureter. On the left side the upper pelvis was dilated and drained by a dilated ectopic ureter into the vagina. Specimens of urine taken from all four segments were clear except the one from the ectopic ureter, which contained pus. The patient was allowed to go through the pregnancy. Operation fourteen months after delivery revealed two separate kidneys on the left side, one much smaller above the normal appearing kidney. The supernumerary kidney with ectopic ureter drained into the vagina. The supernumerary kidney, its pelvis and a portion of its ureter were removed. Microscopic study of the removed tissue showed considerable fibrosis and round cell infiltration. Since operation the patient has been free from any urinary soiling or infection. The upper pelvis on the right side may also drain a supernumerary kidney. This segment may later become infected and require a surgical procedure.

- \*Quinidine in Auricular Fibrillation. R. Berman and J. S. Blumenthal. Minneapolis—p. 198.

**Auricular Fibrillation**—Of 97 patients with auricular fibrillation seen during 1939, Berman and Blumenthal treated 48 with quinidine in doses up to 48 grains (3 Gm.) a day. The disorder of 15 was regulated and that of 33 did not respond.

to treatment. There were 6 deaths. The disorder in none of the 49 control patients became regular, there were 2 deaths. After the heart rate was retarded with digitalis, quinidine was administered according to the method of Weisman, the total daily dose was divided into three or four equal parts and administered at hourly intervals during the morning. The daily dose was increased by 3 to 5 grains (0.2 to 0.32 Gm) as long as fibrillation persisted and until toxic symptoms developed. The highest dose given was 48 grains. Toxic symptoms of nausea, vomiting, diarrhea, collapse and death occurred following doses as low as 3 grains. Eight of the 15 patients whose condition was regulated remained so for two to twenty-four months after regulation (average fourteen months) and 7 relapsed in one to fourteen months after an average regularity of six months. Quinidine should not be used when the fibrillation has been established for years, when the patient is old and feeble, when the heart is extremely large, when coronary disease is pronounced, when compensation cannot be established or when the heart cannot be slowed with digitalis.

Paradoxical Hematemesis. Report of Case. F. Hinman Jr., Baltimore—p. 417.  
Endoscopy. E. B. Benedict, Boston—p. 449.

**Spastic Children**—Denhoff and Bradley administered curare in various doses by several routes to 6 children with cerebral palsy. Throughout the period of treatment the children's daily activities were not curtailed. Two children each were given curare by the subcutaneous, intravenous or intramuscular route. The intramuscular route proved the most satisfactory, and subsequent determinations were made on the basis of this route. The optimal dose for each child was determined by gradually increasing the initial dose of 5 mg by 5 mg until mild paralytic symptoms of overdosage appeared. A maintenance dose was then established slightly (4 to 8 mg) below this level. To eliminate any possibility that beneficial effects of curare injection could have resulted through suggestion, the response of each child to intramuscular injection of sterile saline solution was observed and also after each child had been on a maintenance dose for some time the results during several days to several weeks without medication were noted. The effect of curare combined with 10 to 20 mg of amphetamine sulfate daily was studied. Progress under physical therapy was definitely accelerated by curare in the 6 children. When amphetamine sulfate was added, the accomplishments of 4 of the children were even further increased because of the additional "drive" that the drug imparted. Without curare the amphetamine presumably stimulates the same drive, but because of rigid, unmanageable limbs the child is frustrated in his attempt to accomplish some muscular act and as a result becomes irritable or sulky. By systematic individual adjustment 0.9 to 3.3 mg of curare per kilogram of body weight resulted in muscular relaxation lasting approximately four days. Toxic or dangerous side effects were not encountered, and continued use did not appear to establish tolerance.

**Chemotherapy and Surgery**—Jackson questioned twelve leading surgeons on the value of the intraperitoneal use of sulfanilamide and sulfathiazole. Eight feel that the drugs definitely lower the mortality and ten that they decrease complications. A review of 161 major operations performed in clean surgical cases in which a sulfonamide derivative in the form of powder was sprinkled in the incision reveals that no infections occurred. Still more remarkable results were obtained with the use of sulfathiazole intraperitoneally in 13 cases of perforated appendix, 3 of pelvic abscesses, 3 abscesses from perforation of a malignant growth of the colon or sigmoid, 2 of perforated ulcer, 2 of perforation of the gallbladder with localized abscess and 1 of acute perforation of the gallbladder with free bile throughout the peritoneal cavity. In the latter series there were no deaths or serious complications, such as pulmonary sequelae, prolonged wound drainage, cystitis, postoperative ileus or obstruction. Sulfathiazole did not prevent postoperative thrombophlebitis, as 2 instances occurred. Chemotherapy will never replace good surgery but as an adjunct to it it is without an equal.

**Severe Hyperthyroidism**—Crile believes that a unilateral injury of a recurrent laryngeal nerve constitutes a definite hazard, for the incidence of recurrent laryngeal nerve paralysis seems to be an important factor in influencing the postoperative mortality rate of thyroid surgery. Rarely is the paralysis directly responsible for a postoperative death, but it may affect the patient's convalescence in devious ways and thus increase the mortality rate of thyroid surgery. Injury of a recurrent laryngeal nerve may be the initial accident leading to serious postoperative complications. Since the author has adopted a technic in which the inferior thyroid arteries are ligated outside the capsule of the thyroid, the incidence of persistent recurrent laryngeal paralysis of the vocal cord has fallen to 0.29 per cent in the last 375 cases. There have been no deaths since the advent of the sulfonamide drugs, the threat of pneumonia has practically disappeared and the operation need no longer be performed in stages. The importance of diet, sedation, oxygen and antipyretics in the postoperative care of these patients can never be overemphasized.

**Meningococcal Encephalitis**—Banks and McCartney discuss their observations on encephalitis and cite cases illustrating the main clinicopathologic types. During the epidemic of 1940-1941 a number of cases of fulminating and acute meningococcal infection were observed. Experience suggests that the meningococcus invades meningeal or cerebral vessels and thence reaches the subarachnoid space. In the ordinary form, beyond an occasional capillary thrombosis there is little or no recognizable cerebral lesion. When the organism is highly virulent and the dose massive, cases are found near the peak of an epidemic in which cerebrospinal invasion is of much greater intensity and range. Three distinct clinicopathologic degrees of this invasion can be recognized. The first the most intense and probably the most rare is a fulminating encephalitis without or with meningitis. This form is characterized by a profuse purpuric rash with rapid onset of coma and by death within twenty-four hours. Intense congestion and edema, small hemorrhages and widespread capillary thrombosis in the central nervous axis, with little evidence of polymorphonuclear infiltration, are seen. The process is consistent with a toxic effect produced by a massive dose of a highly virulent organism. In the most rapidly fatal cases, meningitis does not have time to develop. In others meningitis commences and occasionally the adrenals, accompanied by massive hemorrhage, may be invaded. Mixtures of these two fulminating forms may occur. The second type, slightly less intense than the fulminating is an acute encephalomyelitis. It is characterized by signs of acute meningitis which rapidly become complicated by encephalitic signs. These patients usually die within a few days without regaining consciousness. Recovery with transient parkinsonian symptoms may also result. Pathologically congestion and edema with capillary thrombosis and hemorrhages scattered regionally are seen. Another lesion is an inflammatory reaction, shown by perivascular polymorphonuclear cuffing and hemorrhage. Under sulfonamide treatment both the meningitis and the cerebral inflammatory reaction usually clear up but the toxic damage is relatively unaffected and it is probably the principal cause of death. In the third main syndrome a meningitis with focal encephalomyelitis, the cerebral invasion is less and may be seen at the most virulent phase of an epidemic and also at other stages. The clinical picture is diverse and includes protracted and recurrent delirium with sudden fatal collapse, or sudden convulsions with secondary coma and death, or even deep coma from large subdural hemorrhage. The pathologic lesion is a purulent meningitis with a limited number of small hemorrhages and sometimes thrombosis and slight perivascular infiltration usually about the basal ganglia, midbrain, medulla or upper cord.

**Histoplasmosis of Darling**—Derry and his colleagues believe that they are reporting the first case of histoplasmosis of Darling to occur outside the American continent. Nothing in their patient's history suggested a probable source of the infection. The patient a soldier of 30 was admitted to an emergency medical service hospital on April 8 1940 from a base hospital in France with the complaint of cough and sore throat for three months and a painless swelling in the pre-tracheal region a month before which had disappeared in five days. On the supposition that the case might be kala azar, antimony intravenously was started but stopped owing to the discovery of the fungus and large doses of potassium iodide were given. However the patient died four and a half months

after admission. Diagnosis cannot be made on clinical grounds alone, microscopic and cultural methods must be employed. The increase in the number of cases recently reported from America suggests to the authors that this infection has been overlooked in the past in America and in this country. Cultures of the strain of the yeast form *Histoplasma capsulatum* from their patient were found to be still viable up to nine months on dextrose-agar. These periods are longer than those recorded for survival of some of the American strains on other mediums.

**Pulmonary Fat Embolism**—The records and roentgen studies of 4 patients who have survived fat embolism are discussed by Scott and his co-workers. Clinically the first case was one of pulmonary and systemic fat embolism with characteristic signs. After an interval of six days there was sudden respiratory distress associated with purpuric hemorrhages over the neck and upper parts of the trunk. The physical signs were those of acute pulmonary edema and the roentgen changes were typical of the condition. There was no laboratory information to confirm the presence of fat. The second patient showed slight cyanosis and a raised respiratory rate after signs of shock had passed, and these signs were thought to be due to pulmonary fat embolism because the chest was not injured and the roentgenogram showed no abnormality. Fat was found in the sputum and the urine the next day, and in diminishing quantities at subsequent examination. The sputum was not examined microscopically. The third instance was pulmonary fat embolism in a patient with chronic bronchitis who recovered from a subsequent pneumonia. These 3 patients had sustained fractures. The wall of the chest of the last patient was injured by direct violence. Clinically and roentgenographically extensive consolidation of the left lung attributed to pulmonary concussion was elicited. Subsequently it was shown that there was pulmonary fat embolism. Bronchitis and later a pneumonia developed from which the patient has recovered, but bronchitis persists. Considerable quantities of fat may be retained in the lungs, sufficient to cause definite respiratory embarrassment, without producing roentgen changes.

Use of Cystourethrogram in Diagnosis of Various Conditions in Lower Portion of Urinary Tract H Mortensen —p 157

Studies in Tuberculosis R Webster —p 160

Treatment of Essential Hypertension B T Shallard —p 166

**Tuberculosis**—Webster states that biopsy study of lymph nodes in the diagnosis of tuberculosis of joints is the procedure that holds promise and merits careful examination and judicious application, as too often clinical and roentgen signs are insufficient to establish a diagnosis in the early and imperative stage. From the observations of Valls and of Seddon and the author's results, it appears that tuberculous inguinal lymphadenitis is a frequent concomitant of tuberculosis of the knee joint and that biopsy of the lymph nodes in relation to other suspected joints might profitably be instituted. Several of the inguinal nodes which enabled the author to obtain confirmatory laboratory evidence of tuberculosis of the knee joint were so small that the initial hemisection of the unformalized specimen was difficult. The only patients in whom inguinal adenitis was clinically evident were 2 children considered to be suffering from tuberculosis of the hip joint. This feature supports the attribution of tuberculosis of the inguinal nodes in these 2 children to cutaneous tuberculous foci rather than to tuberculosis of the hip joint. Tuberculous lymphadenitis was demonstrated in the inguinal lymphatic nodes of 6 of 7 patients all but 1 of whom were suffering from tuberculosis of the knee joint, in an inguinal node of 1 adult exhibiting advanced tuberculosis of the ankle joint and in an axillary node of a child affected with tuberculosis of the wrist joint. Uniformly negative results with respect to tuberculosis were obtained from the study of the lymphatic nodes excised from 15 patients with arthritis. If the tubercle bacilli reach the inguinal lymphatic nodes and initiate reactive changes other micro-organisms particularly the pyogenic cocci may be expected to do likewise.

\*Acute Syphilitic Ataxia H. Williams, D. A. Passanante and D. Mamone—p. 131

**Acute Syphilitic Ataxia**—Williams and his collaborators direct attention to an atypical form of acute ataxia in cases of neurosyphilis the clinical symptoms of which correspond to the type of acute tabetic ataxia described by Guillain. The type described by the authors is tabetiform rather than tabetic. It is controlled by antisyphilitic therapy. The Argyll Robertson sign disappears and the achilles and patellar reflexes reappear, whereas in acute tabetic ataxia the Argyll Robertson sign is present and the patellar and achilles reflexes are absent. The author believes that the tabetiform type of acute syphilitic ataxia is caused by posterior meningomyeloradiculitis in cases of neurosyphilis.

Thrombosis of Splenic Vein D. Fuks—p. 61

**Treatment of Bacillary Dysentery with Sulfathiazole**—Valdes and Sosa Gallardo quote figures which indicate that a large percentage of acute diarrheas in infants are caused by dysenteric infections. In view of the fact that therapeutic measures such as diet, serum, bacteriophage and symptomatic drugs produced only mediocre results, the authors decided to use sulfathiazole. The drug was administered by mouth in doses recommended for coccid infections, namely 0.2 Gm per kilogram of body weight daily. This amount was given divided at four hour intervals. After forty-eight hours the dose can be diminished, but the medication is to be continued for from four to eight days. The authors treated 35 cases (17 of Shiga dysentery, 16 of Flexner and 2 of Sonne) which had been bacteriologically verified. There was no mortality, tenesmus, colic and other disturbances disappeared within six to eight hours after the ingestion of the drug, the number of evacuations decreased and became normal before seventy-two hours had elapsed, toxic symptoms improved. The authors gained the impression that the cases of diarrhea which proved refractory to sulfathiazole must be considered of nondysenteric origin.

\*Remarkable Late Results in Central Nervous System of Acute Carbon Monoxide Poisoning in Very Hot Atmosphere K. Humperdinck—p. 417

Question of Possibility of Walking with Fresh Femoral Fracture Insurance Aspects A. Slany—p. 430

**Late Central Nervous Sequels Following Monoxide Poisoning in Hot Atmosphere**—Humperdinck reports the history of a locksmith aged 40 who worked on a ventilator inside a large economizer. The temperature was so high that the work had to be interrupted every five or six minutes. It required in all two and one-half hours, but the worker felt faint and had to interrupt the work for one hour. There was no loss of consciousness, vomiting or severe vertigo. In the evening of the same day a change was noted in the man. He was in a state of agitation and talked as if intoxicated. He continued to work for eight more days, but there was a decided change in his behavior. The formerly quiet worker talked and sang constantly and complained of fatigue and headache. Gradually a severe psychosis developed. Examination disclosed no signs of cerebral tumor or syphilis but rather symptoms of a severe organic disease of the brain, which in many respects resembled that of dementia paralytica. Death occurred six years later. Necropsy disclosed extensive foci of malacia in the medullary substance of both hemispheres. Since all other causes of malacia could be excluded, it was ascribed to anoxemia and, because of the history, to acute carbon monoxide poisoning. Compensation had at first been denied, because typical signs of acute carbon monoxide poisoning were not present. The influence of the almost unbearable heat cannot be ignored.

\*Fatty Infiltration of Liver H. W. Sachs—p. 253

**Extramedullary Myelopoiesis in Embryonal Adenosarcomas**—Svendsen reports typical adenosarcoma in 2 children aged 3 years and in a woman aged 21. He emphasizes the pronounced vascularization of the tumors and suggests that some of the cavities lined with low to flat epithelium like cells are embryonal traces of vessels. Around these cavities erythropoiesis could be observed. Granulopoiesis could be seen near the epithelium-like nodules. Reports in the literature regarding blood-forming tissues in the renal pelvis are associated with these observations. The author suggests that adenosarcomas originate in mesenchymal cells of the renal excretory system. The spaces lined with high columnar epithelium-like cells are regarded as formations belonging to the pronephros. The mesenchymal cells give rise to various connective tissue formations, structures belonging to embryonal hematic islands and hemopoietic tissue.

**Flat, Cavernous Dural Hematoma "Hemorrhagic Internal Pachymeningitis"**—According to Hompesch there is as yet no agreement about the genesis of so called hemorrhagic internal pachymeningitis. Clinicians still believe that it can originate from a primary hemorrhage. Jores and Laurent as well as van Vleuten and Boeckmann, demonstrated that this view is untenable. The author reviews 7 cases which throw light on the genesis of hemorrhagic internal pachymeningitis. The vascular form of hemorrhagic internal pachymeningitis does not have an inflammatory or reactive pathogenesis. On the contrary, it could be demonstrated that this disorder is a flat cavernous hemangioma. It is a tumor-like defect. Hemorrhages are always secondary manifestations. The original aspects may be changed by such hemorrhages. The author suggests replacing the term hemorrhagic internal pachymeningitis by flat cavernous hemangioma of the dura, which corresponds to the nature of this disease.

**Fatty Infiltration of Liver**—Sachs demonstrates that five topographic types can be differentiated in fatty infiltration of the hepatic lobules and cells: (1) scattered drops in the lobules, (2) central peribiliary infiltration, (3) central perivascular infiltration, (4) peripheral perivascular infiltration and (5) focal perivascular infiltration. The diffuse fatty infiltration is regarded as a particularly extensive form of the central perivascular or the peripheral perivascular fatty infiltration. In order to draw etiologic conclusions from the topographic type of fatty infiltration, the cases with pure topographic type of infiltration were selected first from the entire material and classified according to their diagnosis at necropsy. It was possible to classify most of the complicated cases. The tabulation permitted inferences about the etiology and it was possible to classify type 1 as the physiologic, type 3 as the hypoxemic and type 4 as toxic fatty infiltration. For the type listed under 2 a connection with brown hepatic pigment was suspected and it was attempted to explain type 5 as similar to hypoxemic toxic fatty infiltration. It is assumed that the nutritional etiology is of importance but that it only intensifies the fatty infiltration which is brought on by other factors. Fatty degeneration is not a primary metabolic disturbance but is only the result of a parenchymal lesion, which would be hidden in retarded utilization of fat, residues were not formed in damaged hepatic cells. A storage function of the liver is denied, and steatosis is regarded as the severest form of fatty infiltration. The author suggests a hypothesis of hepatic utilization of fat and its disturbances and a topographic and morphologic classification of fatty infiltration.

## Book Notices

**The Principles of Neurological Surgery** By Loyal Davis M.S. M.D. Ph.D. Professor of Surgery and Chairman of the Division of Surgery Northwestern University Medical School Chicago Second edition Cloth Price \$7 Pp 503 with 303 illustrations Philadelphia Lea C Febiger 1942

A second edition of this elementary treatise on neurologic surgery indicates that it has been found useful. In this edition many errors which crept into the first edition have been corrected. The advice given is sound and conservative. It is a little difficult to see what purpose is served by the first chapter. A practitioner who depended on the sketchy information contained in it could not possibly make a satisfactory neurologic examination. The author would have done better to emphasize those examinations of special importance to neurosurgery at greater length. The chapter is so condensed that it necessarily abounds in dogmatic half statements. Plate I is unsatisfactory, hardly any student with only the picture C in mind would recognize a choked disk. Photographs are proper in support of a scientific thesis, but in an elementary treatise such as this a good analytic drawing would be much more useful. Moreover, the material in the chapter is badly organized, for example, uncinate fits are described under the olfactory nerve and not with the regional symptomatology of the cerebrum.

An excellent chapter on craniocerebral injuries follows. One notes only an occasional lack of specificity in the directions for treatment. For example, that one should give "a solution of cream, eggs and sugar which contains 1 calory for each cubic centimeter of fluid." One wonders how many practitioners could make up such a solution. Figures 14 and 15, attributed to Dr Paul B Magnuson, are copied from Cushing (*Brit M J*, Feb 23, 1918, figs 4 and 14). The normal pressure of the human spinal fluid is usually given as 70-180 mm of water. In discussion of the gliomas the author notes that "these tumors have been subdivided by various methods by many individuals and as a result there is still no completely uniform nomenclature by which the gliomas may be classified." He then proceeds to follow slavishly the classification of Bailey and Cushing. Why not say so? The author does not mention in the discussion of angiomas that a preoperative diagnosis may be made by angiography or that it is possible by this method to recognize glioblastomas in a large percentage of cases. In general he seems inclined to overestimate the dangers of the method. Many of the roentgenograms are not very demonstrative to the uninitiated, figure 53, for example. It seems illogical to put Zenker's fluid into an abscess. The wall of a cerebral abscess collapses and shrinks of its own accord when it is evacuated, and the Zenker's fluid can only make more necrotic tissue, as will also coagulation of the wall with an electric cautery. The advice given concerning trigeminal neuralgia is excellent. The discussion of spinal cord injuries, injuries of peripheral nerves and of spinal cord tumors is clear and concise. The same cannot be said concerning the chapters on the autonomic nervous system. But here the author finds himself on controversial ground and has not resisted the temptation to enter into too much detail for an elementary treatise. However, he ends by leaving the reader in no doubt of his own attitude toward the problem. The reviewer is in entire sympathy with his discussion of surgical epilepsy. After completing the book, one has the impression that its defects are of minor importance and that the advice given is sound and conservative. It is a safe guide to place in the hands of the practitioner.

**A Textbook of the Practice of Medicine** By Various Authors Edited by Frederick W Price M.D. CM FRCP Consulting Physician to the Royal Northern Hospital London Sixth edition Cloth Price \$12.50 Pp 2 032 with 99 illustrations New York & London Oxford University Press 1941

The last previous edition of this well known British textbook of medicine appeared only four years ago. Many sections have been entirely rewritten and there have been extensive revisions in others. This revision has encountered exceptional difficulties on account of the war. There are four new contributors the list includes such authorities as Sir W Langdon Brown W S C Copenman N Hamilton Fairley Lord Horder, Donald

Hunter, Sir Arthur Hurst and Sir W H Willcox (the last having died since this edition went to press). As is inevitable, there is considerable disparity in the information contained in different sections. The treatment of gonococcal infections is given only three sentences, although the treatment of coliform bacillus infections is discussed in detail (the two incidentally, having been written by the same contributor), in the light of present information available, it would probably have been valuable to write in greater detail concerning the prophylactic value of tetanus toxoid. In some sections no references at all are cited, others give the names of individuals with the dates of their contributions in parentheses, there are exceedingly few full references—one of them (p 440) being to an article published in 1910. Under treatment of the leukemias no mention is made of radioactive phosphorus, although antileukocytic serums are mentioned. Such minor criticisms could be multiplied but in the main, the contributors and the editor have done an excellent job which should insure the continued popularity of this standard textbook.

**Competitive Swimming and Diving** By David A Armbruster Sr M.A. Associate Professor of Physical Education and Head Swimming Coach University of Iowa Iowa City Cloth Price \$3.25 Pp 301 with illustrations St Louis C V Mosby Company 1942

Swimming is the "king of sports and the sport of queens." Its age, excellence as exercise, its worldwide appeal, its rating as big business, its romance and glamor warrant such a designation. Wherever the climate permits, it is a leading sport. Even football with costly stadiums, high salaried coaches and experts on publicity takes second place to the millions invested in seaside resorts, the pageantry of popular beaches and the interest in the selection of bathing beauties. Notwithstanding its popularity as a sport, the technique, kinesiological principles, physiology and physical laws of swimming have received relatively little attention. The head coach of swimming at Iowa has recognized this fact and has successfully produced a book to meet this need. It should prove an excellent addition to the library of those interested in physical education and sports. The book is comprehensive, concise and well written. Its illustrations "were secured almost entirely from an underwater movie study of some of the world's greatest swimmers." They are, therefore, forceful and informative. The chapters on "conditioning" and "competitive springboard diving" are especially valuable. The volume should prove a useful guide for the experienced coach and the expert swimmer. The beginner should find it helpful in learning the various phases of the intricate techniques essential in acquiring grace and speed in diving and swimming.

**Proceedings of the American Diabetes Association First Annual Meeting Cleveland Ohio June 1 1941** Volume I Cloth Pp 148 with illustrations Cincinnati 1942

Five years ago a group of men informally discussed the idea of forming a national diabetes association and later invited the cooperation of local diabetes organizations in several large cities. The Committee for the Establishment of an American Diabetes Association met in New York City in 1940 at the time of the annual meeting of the American Medical Association. A constitution and by-laws were adopted and on Aug 28 1940 the American Diabetes Association was incorporated as a nonprofit organization in the state of Ohio. The first annual meeting of the association was held a few days previous to the annual session of the American Medical Association in Cleveland in June 1941. This volume contains the proceedings of that meeting and the various papers and discussions presented. A list of members of the American Diabetes Association, the constitution and by-laws and the report of the secretary and treasurer. The Banting Memorial Address given by Dr Elliott P Joslin entitled "Diabetes Yesterday Today and Tomorrow" contains some delightful intimate historical bits about Dr Joslin's early interest and despair in treating children with diabetes before the introduction of insulin and the great things he has been able to do for these patients since insulin was discovered. There are also papers and discussions by other well known workers in this field.

**A New Dictionary of Quotations on Historical Principles from Ancient and Modern Sources** Selected and edited by H. L. Mencken. Cloth Price, \$7.50. Pp. 1,317. New York: Alfred A. Knopf, 1942.

There are many books of quotations, so that one might well wonder why Mr. Mencken should decide to bring out his own. Certainly it was not from a lack of knowledge of other works, because he himself refers to the famous Bartlett's, later revised by Christopher Morley, also the books by Hoyt and Stevenson. The Mencken book differs by being planned on a historical arrangement, adequate as to bibliography, by the omission of platitudes and by a free intermixture of unusual materials with the old and the hackneyed. He has chosen many Biblical quotations omitted by previous compilers, and he has selected somewhat from foreign writers and provided adequate translations. A long list of acknowledgments to various publishers indicates the extent of the writers from whom Mr. Mencken has selected. The natural humor of the writer is apparent in his citation of the definitions of chiropractic and osteopathy, which are certainly not to be found in any other book of quotations. Under Golf appears the statement "It is unjust to claim the privileges of age and retain the playthings of childhood," taken from Samuel Johnson. Under this there is a reference "See also Child Labor." When Child Labor is consulted, one finds that classic of Sarah N. Cleghorn, now widely quoted:

The golf links lie so near the mill  
That almost every day  
The laboring children can look out  
And see the men at play.

For those of the medical profession there are considerable numbers of references under the usual headings of physicians, food, heart, health, medicine and similar topics, offering innumerable texts for useful exercises in writing. The book is excellently printed, easily readable and certainly a contribution well worth while.

**Immunology** By Noble Pierce Sherwood, Ph.D., M.D., F.A.C.P., Professor of Bacteriology, University of Kansas, Lawrence. Second edition. Cloth Price, \$6.50. Pp. 639, with 34 illustrations. St. Louis: C. V. Mosby Company, 1941.

In this edition two new chapters have been added: one on the reticuloendothelial system and the other on serum reactions. Revisions have been made in other chapters and the references brought up to date. The book continues to be essentially a textbook for beginning students of immunology and serology. It is written simply and covers the subject very well. No attempt is made to go extensively into the many complicated problems of immunology. The author has tried rather to introduce as many as possible of the more interesting phases of the subject to beginners. One may question the advisability of so many references, but the large list offers a good selection for varied interests. The book is well printed on a good quality of paper, and the illustrations are well selected. The author is well known as a competent student of the subject about which he writes, and the book should continue to prove of great value.

**The Diseases of the Basal Ganglia** Proceedings of the Association December 20 and 21, 1940. New York: Editorial Board: Tracy J. Putnam, M.D., Chairman, Angus M. Fiantz, M.D., and S. Walter Ranson, M.D. Research Publications Association for Research in Nervous and Mental Diseases. Volume XXI. Cloth Price, \$10. Pp. 719, with 268 illustrations. Baltimore: Williams & Wilkins Company, 1942.

Like its predecessors, this volume holds a vast fund of information valuable for the research man in the field of the nervous system. Yet the work serves to emphasize how far the association has moved away from its original purpose. No longer does one get the feeling of an active group of eager scientists discussing vigorously a particular problem bringing to it original and recent work with a spirit of scientific controversy. Instead the papers are formal and long (never completely read at the meeting) and the discussion is sterile and minimal. The chapters on anatomy are excellent, the vascular supply is well done but could be shortened by half. There is no reason for a hundred and fifty pages devoted to histopathology with detailed clinical histories in Leo Alexander's chapter. Much in this volume is summary of knowledge, a shorter, concisely written symposium on newly discovered facts is what is expected from the proceedings of the Association for Research in Nervous and Mental Diseases.

**El signo de Arce** Por Aquiles S. Lentino. Tesis de doctorado. Universidad Nacional de Buenos Aires, Facultad de Ciencias Médicas. Pp. 33, with 15 illustrations. Buenos Aires: Imprenta Amorrotu, 1941.

This is a doctorate thesis which emphasizes the importance of the localization of intrathoracic tumors and describes particularly Arce's sign. Jose Arce is the dean of the medical department of the University of Buenos Aires, formerly head of the Institute of Clinical Surgery. Arce's sign is the radiologic sign observed by comparing radiographic images before and after the establishment of pneumothorax. In the roentgenograms obtained after pneumothorax it is noted that pulmonary tumors undergo double displacement, both vertical and horizontal, in the direction of the pulmonary hilus. When comparing the roentgenograms one sees that the tumor shadow has not undergone any displacement, it may be affirmed that the tumor is extrapulmonary and it may be said that there is no Arce's sign or that the finding is negative. The thesis constitutes an excellent, though brief, presentation of the subject of pulmonary tumors, with illustrative roentgenograms which in the most part are nicely reproduced. Several interesting case histories are appended.

**A Study of the Effect of Lead Arsenate Exposure on Orchardists and Consumers of Sprayed Fruit** By Paul A. Neal, Surgeon, et al. From the Division of Industrial Hygiene, National Institute of Health. Prepared by direction of the Surgeon General, Federal Security Agency, Public Health Service. Public Health Bulletin No. 267. Paper Price 40 cents. Pp. 181, with 42 illustrations. Washington, D. C.: U.S. Government Printing Office, 1941.

Several years ago the U. S. Public Health Service was assigned the problem of studying the effect of lead arsenite on orchardists and consumers of fruit that had been sprayed with this toxic insecticide. The present volume contains the first comprehensive report of the investigations of the Public Health Service. An epidemiologic study has led the authors to conclude that the unusual environmental exposure to lead to which orchardists in the state of Washington are exposed constitutes no important health hazard. The children in the Wenatchee district showed higher values for blood lead, urinary lead and urinary arsenic content but there was in the opinion of the investigators no indication at the time of the examination of adverse effects on the health of these children. There appear to be no data in this series of studies on which there could be based a satisfactory tolerance for the lead content of apples and other fruits which have been sprayed with lead arsenite.

**Psychoanalytical Method and the Doctrine of Freud** By Roland Dulla, docteur ès-lettres, agrégé de philosophie. With an introduction by I. F. Strauss, M.A., M.D., F.R.C.P., Physician for Psychological Medicine at Bartholomew's Hospital, London. Volume I: Exposition. Volume II: Discussion. Translated from the French by T. F. Lindsay. Cloth Price, \$9. Pp. 415, 331. New York, Toronto & London: Longmans, Green & Co., 1941.

These two volumes consist of closely printed pages of citation of literature, quotations of case histories and endless argumentation of a philosophical rather than a scientific nature. The work does nothing to clarify psychoanalysis, and no one will be persuaded to take any stand on the controversies raised except to agree with the reviewer that paper was wasted.

**Modern Medicine: Its Progress and Opportunities** By Nellie W. W. Minnesota Department of Health, and S. A. Welsman, M.D., F.A.C.P., Clinical Associate Professor of Medicine, University of Minnesota. Minneapolis: Cloth Price, \$2. Pp. 218. New York: George W. P. Publisher, Inc., 1942.

This volume, which presents for the lay reader a review of the historical development of certain aspects of medicine, is a little that has not been reproduced elsewhere in more intelligent terminology.

**Was der praktische Arzt über Vitamine wissen soll** Von Dr. R. F. Recknagel, Chefarzt des Sanatoriums Schloss Hornburg. Pp. 135. Leipzig: Georg Thieme, 1941.

This is a brief presentation of some important facts about vitamins. It gives also some pertinent data regarding commercial vitamin preparations available in Germany. It is of little value to physicians in this country.

## Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS BUT THESE WILL BE OMITTED ON REQUEST.

### WOUNDS AND DISINFECTANTS

To the Editor—I am particularly desirous of obtaining an authoritative opinion on the efficacy of various antiseptics for use in first aid work in schools and minor emergency cases. I should like to know the antiseptic or therapeutic value of various drugs, their phenol coefficients and margins of safety or therapeutic indexes. I am interested in comparisons especially between mercurochrome tincture of iodine and the organic mercurial compounds such as mercurin, merthiolate and metophen and their margins of safety, possibilities of tissue damage and their indication for prevention of infection when used immediately after injury. Please omit name.  
M D., Missouri?

To the Editor—The first aid manual of one of the large Pacific Coast companies is being remodeled and I need specific and exact information from sources who should best know about the treatment of certain conditions. Would you be so kind as to answer briefly the following questions for me? What is the best antiseptic first aid treatment for minor wounds and abrasions for which a physician's services are not ordinarily required? What is the best first aid antiseptic for severe cuts and lacerations before a physician's services can be obtained? Is tincture of iodine a superior or inferior antiseptic when used in these conditions? Why? What do you consider to be the best antiseptic to be used under the conditions mentioned? Why? Would a thorough cleansing of the wound with soap and water by the man on the job be considered as sufficient or superior precaution against infection without the added use of an antiseptic? You may feel that these questions somewhat overlap, therefore you may rather feel that you want to answer them all in one group rather than under separate headings. In any case I would appreciate your opinion. Would you also give me references—either books, articles or men, which or whom I may consult concerning the foregoing?  
L McDonough Gould M D Seattle

ANSWER—These queries can be condensed into two fundamentally important questions, neither of which can be answered simply or with any degree of finality.

First, In the treatment of minor injuries what disinfectants are best? Unfortunately, no method has yet been discovered which measures directly and quantitatively the bacteriologic effects of disinfectants in wounds. Much attention has been devoted to the phenol coefficient and similar in vitro tests of iodine, mercurials and other antiseptic agents. For a valuable summary of these studies reference may be made to McCulloch's *Disinfection and Sterilization* (Philadelphia, Lea & Febiger, 1936). Phenol coefficient tests give most of the mercurials high ratings because they measure bacteriostatic rather than bactericidal power, and even minute amounts of these compounds in cultures prevent the growth of test organisms. If, however, the phenol coefficient test and other standard in vitro tests are so modified by dilutions or by the employment of neutralizing agents as to eliminate the factor of bacteriostasis, very different results will be obtained. By such tests Geppert (*Berl Klin Wchnschr* 26, 789, 819, 1889), Shuppen (*Bull* 198, U S Dept Agr 1930), Meleney and Chatfield (*Surg Gynec & Obst* 52, 430, 1931), Brewer (*THE JOURNAL*, May 20, 1939, p 2009 and personal communication) and others have demonstrated conclusively that the more commonly used organic mercurial compounds, including those mentioned in the query, are relatively feeble germicides. Mercurials as a class are unsurpassed in bacteriostatic power, and it might be supposed that they would for this reason have a beneficial effect in wounds. It must be remembered, however, that skin, sweat, blood and wound secretions contain sulfides and perhaps other reducing agents which have more or less neutralizing effects on all mercurials. The whole question is much confused at present. All that can be said with certainty is that mercurials are far less antibacterial when used on skin and in wounds than the standard in vitro tests might lead one to suppose that the phenol coefficient values of mercurials are not a reliable index of their disinfectant value under conditions of clinical use and that it is not possible at this time to say definitely which of the mercurial compounds is best. Price's quantitative tests of skin disinfection (*THE JOURNAL* Nov 26, 1938, p 1993) seems to show that tincture of iodine is superior to mercurochrome for this purpose, nevertheless,

iodine should not be used in wounds except possibly as a preliminary to debridement.

Second, What first aid treatment should be given traumatic wounds? Fresh wounds should be visualized as containing relatively few bacteria. What germs are present are apt to be concentrated in spots, here and there. For the first four or eight hours an undisturbed wound may be expected to show little change in character, at the end of that time secretions appear, and if any bacteria are present they may be spread by the secretions to all parts of the wound, where they proceed to multiply rapidly and invade the adjacent tissues to a greater or lesser extent. Thus a relatively painless, dry lesion with localized bacterial implants is transformed into a painful, discharging, generally infected one. If a wound is seen during the first few hours, every effort should be made to avoid the second stage just described.

The important principles in the treatment of fresh wounds are to prevent entrance of additional bacteria from without, to remove foreign bodies and devitalized tissue, to prevent if possible the spread of infection from localized areas to the rest of the wound, and to do nothing that will lessen the normal antibacterial powers of body tissues. Many time honored methods of wound treatment violate these fundamental principles and do more harm than good. Washing a wound with water or some weak antiseptic solution in a first aid station, and attempts to wash the surrounding skin with soap, are almost sure to introduce many new bacteria, and the entire wound may thus become seeded with infectious organisms. Flushing a wound with alcohol, iodine or any of the mercurial solutions rarely accomplishes the purposes of disinfection and prevention of infection, instead, the infection already present is thereby spread into previously sterile parts of the wound, the local tissues are injured by the chemical, and the natural defenses of the body are reduced. The only dependable means of disinfecting a wound rapidly is by thorough debridement. The great majority of fresh lacerations will heal with primary closure and rest, provided no foreign or devitalized material is present, and provided the tissues have not been damaged by ill advised treatment with disinfectants. The tissues, if given a chance, are usually capable of taking care of any infection that may be present. Body defenses are best increased by rest, elevation of a dependent part, giving of tetanus antitoxin and the administration of a sulfonamide drug when that is indicated.

The following specific methods of treatment are to be recommended. Fresh, clean scratches, abrasions and excoriations, involving only the superficial layers of skin, may be painted with a mercurial. Aqueous solutions are less painful than alcoholic and probably are just as good. A crust quickly forms which seals the lesion off, preventing further contamination, and under the crust healing usually takes place without evidence of infection. If dirt or grease has been ground into the skin, it must first be removed, with a sterile instrument if possible, but by washing if necessary. So-called soap substitutes may be useful for this purpose, since they are efficient detergents and do not cause pain. A satisfactory method of dressing these wounds is to powder them with sterile sulfanilamide and then cover them with sterile dry gauze. Fresh lacerations of a minor nature which do not require treatment by a physician usually do well if they are merely covered with a sterile unmedicated gauze pad, over which a dressing is applied with gentle pressure. All puncture wounds should be treated in the same way at the first aid station. In case of severe lacerations or avulsed wounds control of hemorrhage is the first consideration. This should be done by tourniquet if possible. If bleeding is not an important feature, or after it has been stopped, the wound should be simply covered with a sterile dressing pending the arrival of a physician. The use of iodine or mercurials in such wounds is to be discouraged or even forbidden. Recent experience with war wounds suggests, however, that sterile sulfanilamide powder in these wounds does relatively little damage to the tissues, although it inhibits the development and spread of infection. As a result the second stage of wound infection is delayed, subsequent treatment by the surgeon, whether simple suture or debridement, is facilitated and the chances of obtaining a primary closure of the wound are increased. Sterile sulfanilamide powder conveniently prepared in sterile paper envelopes for emergency use is or soon will be available.

PROPERTY OF THE

SEASONAL VARIATION IN DIABETES MELLITUS,  
CORRELATION OF BLOOD PHOSPHORUS  
AND BLOOD SUGAR

To the Editor—Will you kindly send me any information you have about (1) the seasonal variation in diabetes mellitus and (2) the correlation of blood phosphorus and blood sugar? Please cite references  
John F Kenney, M D, Pawtucket, R I

ANSWER—1 Dr Herbert L Lombard, director, Division of Adult Hygiene of the Massachusetts Department of Public Health, points out that in 1937 the deaths from diabetes during December and January to May inclusive numbered 16,926 and during June to November inclusive 13,661, thus showing a preponderance in the winter months For comparison he computed deaths from cancer proportional to diabetes totals, and the figures are 15,294 and 15,293 respectively for the two periods, thus emphasizing the significance of the preponderance of diabetes deaths in the colder section of the year Dr Lombard's table follows

| Month     | Diabetes Deaths,<br>United States,<br>1937 | Cancer Deaths, 1937,<br>Proportioned to<br>Diabetes Totals |
|-----------|--|--|
| December  | 2,846                                      | 2,624  |
| January   | 3,330                                      | 2,638  |
| February  | 2,859                                      | 2,305  |
| March     | 2,837                                      | 2,625  |
| April     | 2,598                                      | 2,514  |
| May       | 2,460                                      | 2,588  |
| Totals    | 16,926                                     | 15,294   |
| June      | 2,202                                      | 2,488  |
| July      | 2,261                                      | 2,610  |
| August    | 2,131                                      | 2,596  |
| September | 2,217                                      | 2,464  |
| October   | 2,411                                      | 2,628  |
| November  | 2,439                                      | 2,507  |
| Totals    | 13,661                                     | 15,293   |

Combining the data as done by Dr Lombard for December to May inclusive for comparison with June to November inclusive, the results are

|                  | Indefinite | Gradual | Rapid | Sudden | Totals |
|------------------|------------|---------|-------|--------|--------|
| December to May  | 270        | 347     | 80    | 91     | 788    |
| June to November | 267        | 336     | 89    | 91     | 783    |

But here is shown no preponderance in the winter months, It would seem, therefore, that at present there is no evidence of a seasonal relation of the onset of diabetes, and such is what one would expect from the hereditary and constitutional character of the disease

2 The correlation of blood phosphorus and blood sugar is not a simple one For example, in normal animals the whole or serum phosphate falls when dextrose or epinephrine (which tend to raise the blood sugar) or insulin (which lowers the blood sugar) is administered There is an increase in the hexose monophosphate content of skeletal muscle after insulin and epinephrine injections The whole problem has recently been reviewed by Soskin, Levine and Hechter (*Am J Physiol* 134 40 [Aug] 1941), whose article should be consulted for other references

Soskin and his associates conclude that the fall in blood inorganic phosphate is due to insulin, it is not reflected in a change in the total phosphate content of the blood and they believe that it is probably due to an esterification of the inorganic phosphate outside the muscle The rise in the hexose monophosphate content of muscle is due to epinephrine and results from the breakdown of muscle glycogen "The usual observation of phosphate changes in both blood and muscle after the administration of either insulin or epinephrine to the intact normal animal is due to the reflex evocation of the secretion of one gland by the effects of the hormone of the other gland"

For other references and a general discussion of the subject, see also Jensen, H F *Insulin, Its Chemistry and Physiology*, New York, Commonwealth Fund, 1938, pages 143-145

The relative distribution of diabetic deaths in South America, Australia and New Zealand would be of value in drawing conclusions about seasonal influenza

As for onset, figures as a rule mean little, because the date of onset of diabetes is rarely determined with accuracy Joslin statistics place onset as indefinite in 86 per cent of adults and 35 per cent of children, gradual (within two months to one week) in 94 per cent of adults and 44 per cent of children, rapid (within the course of six days) in 27 per cent of adults and 3 per cent of children and sudden (in the course of one day) in 19 per cent of adults and 3 per cent of children These figures are based on a study of 1,009 adults and 489 children Obviously, data concerning adults are of little value, and even for children data in the indefinite and gradual groups would not carry much weight However, with children when the types are rapid and sudden, the months of onset deserve attention All the cases of children with diabetes in Joslin's clinic have been classified in the four groups of indefinite, gradual, rapid and sudden by months in the following table The term unknown refers to cases in which the type of onset is not definitely recorded, but in which a guess was made at the month

| Month     | Indefinite | Gradual | Rapid | Sudden | Unknown | Totals |
|-----------|------------|---------|-------|--------|---------|--------|
| January   | 93         | 81      | 16    | 15     | 5       | 210    |
| February  | 34         | 58      | 13    | 18     | 7       | 130    |
| March     | 44         | 50      | 16    | 12     | 6       | 128    |
| April     | 32         | 40      | 11    | 15     | 8       | 106    |
| May       | 24         | 48      | 10    | 10     | 8       | 100    |
| June      | 61         | 50      | 18    | 8      | 10      | 147    |
| July      | 48         | 60      | 18    | 10     | 8       | 144    |
| August    | 35         | 52      | 9     | 15     | 11      | 122    |
| September | 54         | 68      | 15    | 20     | 14      | 171    |
| October   | 27         | 51      | 15    | 15     | 5       | 113    |
| November  | 42         | 55      | 14    | 21     | 11      | 145    |
| December  | 43         | 70      | 14    | 21     | 12      | 160    |
| Totals    | 537        | 683     | 169   | 182    | 100     | 1,671  |

The largest number of cases in the indefinite and gradual classes occur in January This can be attributed to the psychological tendency, when in doubt, of placing cases in January of the same year when seen rather than in the preceding year

TOTAL ALOPECIA

To the Editor—A woman aged 40 had alopecia areata eight years ago which was treated with various local applications, irradiations and the administration of thyroid and anterior pituitary extracts with no appreciable success In three years the alopecia became total and is now universal, there are also dryness of the skin and a decrease in sweating She has a baby 15 months old, from the fifth month of pregnancy to the third month of lactation the hair on the mother's head grew considerably but disappeared at the end of that period the baby was weaned in the second month What is known of the endocrine aspect? Would corpus luteum therapy have prospects of success?  
M D, Arizona

ANSWER—It is well known that pregnancy stimulates the pilosebaceous apparatus and intensifies pigmentation of the skin Thus it is relatively common to find patches of darkened skin on the face and especially in the folds at the axillas and groins during this period At the same time some lanugo hairs may become dark and bristly, so that more hairs seem to be present With the cessation of pregnancy the normal color of the skin and hair and other characteristics of the hair gradually return In this woman with total alopecia the added stimulus toward hair growth normally present during pregnancy was just sufficient to make new hair appear When the interim stimulus of pregnancy stopped, the hair growing impetus was insufficient and the initial alopecia succeeded

That the endocrine secretions determine in large measure the character of hair growth is acknowledged by all students Accumulated clinical observations and experimental studies show that length, thickness and pattern of hair growth are influenced by increases in endocrine materials due either to administration or to hypertrophy of appropriate glands Thus tumors of the adrenal glands may give rise to increased hair growth and pituitary known endocrine causes for increased hair growth are pituitary basophilism and arrhenoblastoma of the ovary

Knowledge of the influence of the endocrine secretions on hair growth is so fragmentary that one hesitates to make positive and unqualified statements Nevertheless, it can be seen that the corpus luteum activity during pregnancy in the early months probably did not account for the hair growth increase probably growth following the administration of progesterone has been recorded Relatively huge quantities would have to be administered to approximate the amount present in pregnancy Of course, corpus luteum secretion would not account for it

sive hair growth occurring in men. There is a better chance that increased adrenal gland activity accounts for the augmented hair growth in pregnancy.

There is no accepted successful endocrine therapy for alopecia areata. Bengtson claimed that he caused hair growth in alopecia totalis with pituitary products, but his results have not been corroborated. It would seem best to persist in the use of the best known nonendocrine methods even though they are not very effective at the age of 40 in alopecia totalis. Mild erythema doses of ultraviolet rays may be given over an extended period. The well tried use of irritants, such as phenol neutralized after an interval with alcohol, or applications of Cutler's solution are worth while if persisted in. The prognosis of the patient described is distinctly bad because of her age and the totality of the alopecia.

#### EFFECT OF ESTROGENS ON THE CLOSURE OF EPIPHYSES

To the Editor—A girl, aged 14, 5 feet 8 inches (172.7 cm) tall and weighing 130 pounds (59 Kg) has been menstruating regularly for two years. She is in good physical condition except for evidence of healed infantile rickets. Two years ago she was treated elsewhere for three months with large doses of estrogenic substance because with the onset of puberty she had become emotionally unstable. The instability had never been present before this time, and there is no sign remaining now. The girl is already taller than her mother. She has increased 2 inches (5 cm) in height in the last twelve months. Her father is unusually tall. She and her parents visualize that with the present rate of growth and the height at her present immature age, she will soon be pathologically tall. What is the status of endocrine therapy with regard to causing her to cease growing tall by hastening the closure of the epiphyses now? Do such methods have authoritative medical approval? Has enough of this kind of therapy been carried out for one to judge the results from what has happened to persons given such therapy? What adverse effects might such therapy reasonably be expected to have on the pituitary and gynecologic functions of the patient in the future?

George W. Williamson, M.D. Dundee, Mich.

ANSWER—The emotional instability which often marks adolescence is probably associated with changes in the endocrine balance involving increase of the production of estrogen. There is no well known evidence that treatment of young women with such instability with further doses of estrogen is of benefit and no evidence of what this may do for menstrual regularity and the rest of puberal development. It would be expected that such treatment would hasten the union of epiphyses, thereby limiting growth in height. This effect does not appear to have been important if present, since she is said to have grown 2 inches during the second year after the onset of menses. The first thing which should be done is to reassure the patient and her parents that, after menstruation has become regularly established, growth seldom continues long and that she almost certainly will not grow another 2 inches. For objective evidence of this matter, a roentgenogram of the femur may be obtained to decide whether the union of the proximal and distal epiphyses has been completed. If so, no significant gain in height will be expected. There is no therapy for hastening the union of epiphyses which is based on any extensive series of clinical cases, and the use of estrogens, androgens (in the male) or thyroid in either sex is based on theoretical considerations. It should therefore be employed only as experimental therapy under the observation of competent clinical observers. There is no reason why such therapy should have any lasting effect on the pituitary gland or its ability to control the activity of other endocrine organs.

#### REMOVAL OF ESCHAR IN DIABETIC WOMAN

To the Editor—A woman aged 65 with diabetes of long standing received a second degree burn on the sole of the foot from a hot water bottle. Tannic acid jelly and methylrosaniline solution were applied; this formed an eschar which is thick and difficult to remove. There is no active infection present. The diabetes is controlled by diet and insulin but the condition of the foot is very painful and any attempt to remove the eschar is unsuccessful. Can you give some advice as to the proper method of removing this thick and painful crust?

Jean Darche, M.D. Trois Rivières, Que.

ANSWER—A separation of the eschar in a burn of this type may be slow indeed. It is sometimes accelerated by a moist dressing of boric acid for part of the time and by the use of an ointment such as plain petrolatum for the rest of the time. Attempts at surgical removal are usually painful and destined to failure. Should, however, infection develop beneath the crust it is usually advisable to remove it surgically. After the crust is separated soap and water cleanliness plus an ointment such as plain white petrolatum or scarlet red ointment will accelerate the healing.

#### EPIDURAL INJECTION OF PROCAINE HYDROCHLORIDE FOR ACUTE SACROILIAC DISEASE AND SCIATIC NEURITIS

To the Editor—Symptoms of acute sacroiliac disease and sciatic "neuritis" could often be alleviated by an injection of 60 to 75 cc of 0.5 per cent procaine hydrochloride into the caudal canal. What would be the effect of such an injection on patients with low back pain secondary to displacement of the intervertebral disk in the third to fifth lumbar spaces? If no relief of symptoms is obtained in these cases from such an injection could this be used as a differential diagnostic test? I would appreciate your giving me references on the use of caudal injections of procaine for the relief of pains referred along the course of the sciatic nerve.

M.D., Alabama

ANSWER—Pain associated with so called acute sacroiliac disease and sciatic neuritis may be caused by muscle spasm. Such muscle spasm may be relieved by injections of procaine hydrochloride. Displacement of the intervertebral disk from the third to the fifth lumbar spine may be merely a bulging disk with the fibers of the annulus fibrosus or capsule of the disk still intact. Such bulging disks have been seen to relax or go back into the intervertebral space after a laminectomy has been performed. In these instances anesthesia relaxes the muscle spasm and compression forces acting on the disk are diminished, permitting the space to widen and the contour of the disk to retract to normal. Injection of procaine might be expected to be of some value in a case of this type. If the disk is actually ruptured and the nuclear material of the central portion of the disk has been extruded into the extradural space, bringing pressure against a nerve root or impinging a spinal nerve root against a pedicle, the injection of procaine could be of little value. For purposes of differentiating between these two kinds of disk lesions, procaine injections may be of some value. The technique of an epidural injection of procaine or of warm physiologic solution of sodium chloride has been described by Comroe in his textbook on arthritis, page 793. #### SURGICAL RELIEF OF DYSMENORRHEA

To the Editor—A married woman aged 37 who has never been pregnant has had severe dysmenorrhea since the onset of the menses with no relief until a year ago when I started using narcotics. The pain has always been intractable for one day when the flow was established; the pain would cease. For the past six months however the pain has been as severe (not constantly but spasmodically) for four or five days premenstrually as on the first day of flow. Premenstrual tension has been severe also. I have tried practically every remedy. Allergy has been ruled out; there is no ascertainable pelvic pathologic condition. Progesterone therapy has been ineffectual as have been a dilation and curettage and premenstrual therapy with sedatives, catharsis and cadene. About the only medication mentioned in the literature that I have not tried is testosterone propionate whose efficacy I feel has not been proved. I now intend to remove surgically the menstruating portion of the uterus. (The patient is reconciled to not having a child and fears a neurectomy from the dysmenorrhea.) Do you think this surgical treatment would completely eliminate the dysmenorrhea? Would there be premenstrual or menstrual symptoms at all, even though there would be no flow?

M.D., New York

ANSWER—A far simpler and at the same time conservative operation which yields excellent results in cases of intractable dysmenorrhea is presacral sympathectomy. It consists in the removal of that portion of the sympathetic nervous system which lies in the lower lumbar and upper sacral regions. The technique is as follows:

The patient should be placed in the Trendelenburg position after a midline incision has been made from umbilicus downward toward the pubis for about 10 to 12 cm. After the peritoneal cavity is opened, the small intestine is packed off and the sigmoid and rectum are pushed to the left side and held there with a wide retractor. The uterus, adnexa and bladder may then readily be inspected and palpated. The region of the lower two lumbar vertebrae and the upper part of the sacrum is exposed to view. In thin women it is possible in some cases to see the presacral nerve immediately beneath the peritoneum. Whether or not the nerve is seen the parietal peritoneum above and in the middle of the sacral promontory is elevated and incised with scissors. This incision is extended upward for about 4 or 5 cm and for a similar distance down along the sacrum. When the peritoneal flaps are pulled aside a fibrocellular layer of connective tissue will be exposed covered by more or less adipose tissue. This tissue can easily be separated from the peritoneum and the lower end of the aorta without

danger. It is in this layer that the presacral nerve lies. With an aneurysm needle the tissue is elevated at the bifurcation of the aorta, and the dissection is carried to a still higher level. As this is done it will be found that in most instances the tissue spreads out triangularly. The middle sacral artery should be pushed away from the nerve, but if it is injured it can readily be ligated. After the dissection is carried as high as it is desirable to go, the layer of nerve tissue is separated from the underlying tissue down past the sacral promontory into the pelvic cavity. In this region the plexus has divided into the two hypogastric nerves, hence it is necessary to dissect one of these nerves at a time. At least 2 or 3 cm of each hypogastric nerve should be resected in addition to 4 or more cm of the superior hypogastric and the intermesenteric plexuses. The fibrous tissue layer which contains the hypogastric nerves is much more resistant than that which contains the presacral nerve. As the dissection is carried out, nerve filaments projecting outward will be encountered. These should be followed as far laterally as possible before one cuts them. In most instances ganglions will be included in the resection. The dissected tissue should preferably be removed in one piece. It is not necessary or advisable to ligate the presacral nerve or the hypogastric nerves before cutting them, because the only blood vessels in intimate contact with them are insignificant vasa nervorum. Rarely is bleeding encountered which requires more than simple temporary pressure to check it. (Where the mesosigmoid is short, care must be exercised to avoid injury to the inferior mesenteric vessels.) After the nerve is resected, the posterior parietal peritoneum is sutured with plain catgut and the abdominal wall is closed in the customary way.

This operation does not interfere with pregnancy or labor. In fact, not only does it nearly always completely relieve menstrual pain but it also greatly diminishes the pains of labor.

If the menstruating portion of the uterus is completely removed, naturally there would be no further cyclic bleeding. If the entire corpus uteri is not removed, the dysmenorrhea may persist. Regardless of this, the surgical operation indicated in this case is not hysterectomy but pelvic sympathectomy.

#### OXYQUINOLINE, ECZEMA AND CUTICURA

To the Editor—I treated a man with a subacute eczema of the lower third and lateral aspect of the left leg with moist compresses, Lassar's paste, Unna's paste and the like with no improvement. He had never had eczema before, he felt fine, and the physical examination was negative. Finally I told him that I could do no more and advised consultation. Instead, he procured Cuticura Ointment, which promptly healed the eczema. Cuticura Ointment contains beeswax, petrolatum, oxyquinoline, unbleached paraffin and unbleached liquid petrolatum. What action has oxyquinoline? Was the secret of this cure merely the application of an emollient ointment?

M D., Nebraska

ANSWER—Oxyquinoline sulfate (Chinosol) is a neutral salt of oxyquinoline (8-hydroxyquinoline), from which the latter is readily liberated in a nascent condition. In the report of the Council on Pharmacy and Chemistry (*THE JOURNAL*, May 28, 1910, p 1801) it was shown that oxyquinoline is decidedly less efficient in its killing power on bacteria than is phenol, the 1 per cent solution is not certainly fatal to the bacillus of typhoid fever even after ninety minutes' exposure. On the other hand, its power of restraining development is far superior to that of phenol, one part in ten thousand is sufficient to prevent development of *Staphylococcus pyogenes* or the *Eberthella typhosa*. As an antiseptic in various conditions, as vaginitis, rhinitis and similar catarrhs, there is much evidence of its value. It has also been used successfully as an intestinal disinfectant, and Lorch (*Deutsche Aerzte Zeitung*, 1908, p 406) has even obtained favorable results in the treatment of Asiatic cholera. As a local application to mucous membranes, it may be used in strengths of from 1/500 to 1/2,000.

The only active ingredient in the ingredients listed as being contained in Cuticura Ointment is oxyquinoline, which is now being incorporated in some proprietary ointments for its germicidal and fungicidal effect. In the event the subacute eczema of this patient had been irritated by previous stimulating local applications or was the site of secondary infection, "the secret of cure" in this case could well be the bland character of the proprietary ointment plus the fact that it contained an agent (oxyquinoline) which is effective in combating infection. In view of the complex nature of the etiologic factors of eczema, e g local irritants and neurogenic causes, these may have been obviated coincidentally with the application of the proprietary ointment in this case. The factor of coincidence is an important one to be considered in all cases of dermatitis in which prompt healing occasionally occurs after the application of an unknown complex proprietary. It is factors such as these that lead patients to write glowing testimonials to the manufacturer.

Chinosol, the brand of oxyquinoline sulfate manufactured by the Chinosol Company (Parmele Pharmacal Company, distributor), formerly accepted by the Council on Pharmacy and Chemistry, was omitted from New and Nonofficial Remedies 1911 because unwarranted claims were made in the advertising.

#### RECONSTRUCTION OF CONTINUITY OF BILE DUCTS

To the Editor—I have a case in which a part of the common bile duct has completely sloughed out. At the first operation a stone was found at the junction of the hepatic and gallbladder ducts, with an emptying of the gallbladder. The stone and the gallbladder were removed and a T tube was placed in the common duct where the stone was removed. There was drainage for about eight weeks, the wound closed up and the patient felt fine for a month, when jaundice developed and an operation revealed another stone in the same location. The stone was removed and a T tube was reinserted. After the patient recovered from this, jaundice slowly developed again and at the third operation the duct had stenosed completely at its upper end by adhesions. A T tube was again sutured in, with the hope that it would granulate over, but the same process is being repeated now that the tube is being spontaneously pushed out. I have read somewhere about gelatin tubes being used for anastomosis of blood vessels. Where are such tubes available and would this be feasible in attempting to anastomose two ends of the common duct? Are silver, gold or glass tubes ever used for such purposes?

H J Van Duine, M D., Byron Center, Mich.

ANSWER—In plastic operations for the reconstruction of continuity between the ends of the bile ducts or between the extrahepatic bile ducts above a site of stricture and an opening made in the duodenum, absorbable tubes of any kind have no advantages over nonabsorbable tubes. In fact, the latter are preferable, because the longer they can be kept in position the better the chance will be not only for good anastomosis to result but also for the inflammatory reaction around the site of anastomosis to subside without too much formation of scar tissue to contract the anastomosis. The best nonabsorbable tubes are those made of rubber, because they are flexible and pass out of the anastomosis and through the gastrointestinal tract without the possibility of occurrence of pressure necrosis which might be the case if rigid tubes of metal or glass were used and became fixed at any point in the intestine.

If a rubber tube or catheter is used in anastomosing the two ends of the common bile duct, enough of it must extend beyond the sphincter of Oddi into the duodenum so that peristalsis will pull the tube out of the duct. If it does not pass the sphincter of Oddi the tube will remain in the duct, and, since it is a foreign body, bile pigment and cholesterol will be deposited in such a manner as to obstruct the lumen of the tube, and a large stony deposit will form around it, since it forms a nucleus for such deposition.

Studies of the results of the surgical treatment of stricture of the common bile duct indicate that the best chances for preventing recurrence of stricture occur in those cases in which there is a sufficient portion of normal duct above the stricture to enable the surgeon to anastomose it accurately to an opening made in the duodenum (hepaticoduodenostomy) and also in those cases in which the stricture is small in extent, can be excised and the ends of the duct can be approximated without tension. Results in such cases are satisfactory, provided there is not too much hepatic damage or infection.

#### CHRONIC ASYMPTOMATIC SYPHILIS

To the Editor—A white unmarried man aged 20 was admitted to the hospital eight months ago because of tetanus. He was given tetanus antitoxin. A routine Wassermann and Kahn test was 2 plus. Three days after the serum was administered he suffered from severe serum sickness and arthritis. The Wassermann and Kahn tests taken about a month have shown 1 plus or 2 plus reactions during the past few months. There are no symptoms, signs or history of congenital or acquired syphilis. Can this be due to the tetanus antitoxin or should the patient be considered syphilitic and so treated, or should any other tests be performed?

A A Fisher, M D., Woodside, L I., N Y

ANSWER—While the possibility of biologic false positivity in Wassermann and Kahn reactions due to tetanus and disease cannot be denied, this is highly improbable in the fact that both tests have given repeatedly positive results. Under the conditions the possibility of chronic latent syphilis to be seriously considered. A complete examination of the spinal fluid is strongly advisable because nonspecific reactions do not occur as frequently as with serum. It might be noted that with some increase of protein, positive Wassermann and Kahn tests and positive colloidal gold reactions were observed, the results of which

virtually prove the presence of chronic asymptomatic syphilis. Otherwise, serum tests should be tried with three or four different laboratories employing complement fixation and flocculation tests. If all or the majority should give positive reactions there would be strong presumptive evidence of chronic latent syphilis. On the other hand, if the majority observed negative reactions, treatment for chronic syphilis could be omitted on the basis of supposedly nonspecific reactions. It is also advisable to employ the Kahn verification test, although its status in differentiating between falsely positive reactions and those due to latent syphilis cannot be defined at the present time.

#### TREATMENT OF A PATIENT IN THE ABSENCE OF SIGNS OF SYPHILIS BUT WITH POSITIVE SEROLOGIC TESTS

*To the Editor*—A white woman aged 21 came for a premarital serologic test on Aug 12, 1939. A Kahn test was positive. There had been a Kahn test in 1936 which was negative. She had a tuberculous peritonitis in 1933 but no other tuberculous lesion. There were no signs or symptoms of syphilis. The Kahn test was repeated on Aug 16, 1939 and was again positive. A spinal puncture was performed on Oct 20, 1939 and was entirely normal. On Aug 19, 1939 1 cc of bismuth in oil and 0.06 Gm of mapharsen were given and this was given for twelve doses then bismuth in oil only for eight doses and then both for ten doses until a total of seventy-one doses of each were given, at one week intervals until July 1940 when there was a rest period and then completion of treatment with 0.1 Gm of bismarsen in ten doses. She was given moderate oral doses of potassium iodide with the bismuth compound part of the time. The Kahn reactions were positive on the blood Aug 14 and Aug 16, 1939; negative on the spinal fluid Oct 22, 1939; positive on the blood, Jan 22, 1940, negative on the blood, June 29, 1940; positive, June 14, 1941 and positive Sept 13, Oct 18 and Dec 27, 1941. There are no signs or symptoms of syphilis and no history of any exposure or lesion. I felt that she had had adequate treatment. Should she have more treatment and if so what?

M D Michigan

*ANSWER*—If this young woman does have syphilis, she has had almost a sufficient amount of treatment. However, the evidence is by no means conclusive that she had syphilis, as the serologic reports in the inquiry suggest the possibility that they are of a biologically false positive type. It would seem advisable even now to take several samples of blood and to send them to different laboratories to be examined the same day in an effort to determine whether the reports coincide. If the serologic reports from the same sample of blood are conflicting, that is, some positive in varying strengths and some negative, it would then be advisable to continue with observation only. If, however, it should happen that the reports are all 4 plus, two courses of a bismuth compound, twelve injections each, given twice a year for approximately three years would be ample. If she should marry in the meantime and become pregnant, a complete course of treatment throughout the pregnancy would be necessary.

#### TETANUS PROPHYLAXIS

*To the Editor*—In a discussion among the physicians here there is disagreement as to whether tetanus antitoxin should be given in every case of skin laceration and brush burn or whether it should be given only in selective cases. I shall appreciate your letting me know whether members of the clinic would have any additional responsibility in this regard and also what is the general rule and safe legal procedure in administering the antitoxin with a general view of giving antitoxin in practically all lacerations, abrasions and puncture wounds.

M D Texas

*ANSWER*—Tetanus bacilli and spores are so widely distributed in nature that almost any wound may serve as port of their entry into the body. It is indeed true that in civil life wounds are only rarely followed by tetanus, but unfortunately it is not possible to tell beforehand whether tetanus will develop from a particular wound. Tetanus is a deadly disease. While tetanus antitoxin will prevent tetanus, it has little curative effect once tetanus is established. In view of the facts the physician on whom falls the duty to treat first a person who has been exposed to possible tetanus infection and intoxication through a wound cannot be exempt from blame if tetanus develops in case he did not inject antitoxin serum promptly. For prophylactic purposes an injection of 1,500 units is generally regarded as an adequate dose.

It is generally agreed that the average puncture and skin abrasion that does not occur in an area of farm soil or barnyard dirt should not receive tetanus antitoxin. One industrial surgeon has had thousands of cases in which no tetanus antitoxin has been administered and not a single case of tetanus developed. On the other hand, seriously injured persons with large compound fractures from any location should be immunized with both tetanus and gas antitoxin care being taken to give about double, or more of the prophylactic dose.

#### LAUGHING AND PETIT MAL

*To the Editor*—In *Queries and Minor Notes* in *The Journal* Jan 3, 1942 page 94 the case presented in *Laughing and Petit Mal* is one of classic narcolepsy with cataplexy. This condition is described in Best and Taylor *The Physiological Basis of Medical Practice* Baltimore William Wood & Co 1937 page 1394. The only abnormal observation in the case presented is the unconsciousness which never occurs in cataplexy. However, the extremely short period of unconsciousness mentioned may not be true unconsciousness.

Lawrence M Serra, M D, Baltimore

*To the Editor*—It appears most likely that the answer to the question in *Laughing and Petit Mal* has missed the correct diagnosis in the case presented. From the information given it appears most likely that the patient does not have the petit mal form of idiopathic epilepsy at all but rather is a victim of narcolepsy with cataplexy. Contrary to the answer administration of amphetamine or ephedrine is the proper treatment for the drowsiness (narcolepsy), but no treatment other than the voluntary control of laughter will be effective against the cataplectic seizures.

Paul C Bucy M D Chicago

Associate Professor of Neurology and Neurological Surgery University of Illinois College of Medicine

*COMMENT*—In answering the query it was assumed that the facts as given by the questioner were correct and that the patient did lose consciousness momentarily. If this is so, only a diagnosis of petit mal can be considered, for loss of consciousness would not occur in the other conditions under consideration. True, an attack of narcolepsy might confuse the observer; electroencephalographic tracings would aid in the differential diagnosis. Giving amphetamine or ephedrine is the proper treatment for narcolepsy. However, such a diagnosis cannot be made in view of the definite statement by the questioner that the patient did lose consciousness.—Ed

#### ALOPECIA FURFURACEA

*To the Editor*—A woman aged 35 with a diagnosis of alopecia furfuracea has good general health and no pulmonary circulatory or renal disease. The Wassermann reaction is negative. For several months she has had a condition of the scalp accompanied by a good deal of dandruff as indicated by the diagnosis. The local condition cleared up fairly satisfactorily with the use of a saturated solution of molecular sulfur and also with hypodermic medication with an arsenic preparation sodium cacodylate and with internal administration of vitamins. After the improvement of the condition of the scalp she has noticed that her hair continues to fall out profusely. I should like to know if there has been any definite progress made in the science of organotherapy or if there are specific vitamin substances administered hypodermically or orally that would possibly have a tendency to check this malady.

M D Massachusetts

*ANSWER*—Alopecia furfuracea usually involves the temporal and frontal regions first and is associated with branny desquamation of the corneous layer. It is a seborrheic disorder that usually attacks young adults and may persist for several years before the loss of hair is great enough to attract the patient's notice. The thinning process is gradual. Local therapy with stimulating hair lotions and the use of sulfur and salicylic acid are indicated, together with careful hygiene of the scalp. Low systemic tone or anemia must also be treated as indicated. In a recent article (Waisman, Morris, and Kepler, E J *Alopecia Areata. An Appraisal of Endocrine Factors in Its Causation* *THE JOURNAL*, May 3, 1941, p 2004) the following statement was made: "It is our opinion that endocrine treatment, at least in the present state of its development, is ineffectual." The use of vitamins in alopecia is still in its experimental stage and its present status is inconclusive.

#### INTRADERMAL INJECTIONS OF TYPHOID AND DIPHTHERIA VACCINES

*To the Editor*—Please inform me whether the intradermal injection of typhoid and diphtheria vaccines is as effective as the subcutaneous injection for immunization. What doses do you advise for intradermal immunization?

E Fernandez Soto M D, Havana, Cuba

*ANSWER*—The indications are that the intradermal injection of typhoid vaccine and of alum precipitated diphtheria toxoid is just as effective as the subcutaneous. Great care must be used to deposit the vaccine or toxoid intradermally in order to obtain the maximum immunologic response. For intradermal injection of standard typhoid vaccine the dose is one-tenth the dose for subcutaneous injection. This means that 0.1, 0.15 and 0.2 cc. are injected, with an interval of seven days or so between the injections. The same dose is used for children. The U S Army gives one injection of 0.1 cc. of typhoid vaccine intradermally in routine reimmunizations (two years or more after the first immunization). The intradermal dose of alum precipitated diphtheria toxoid is 0.1 cc. A second injection of the same quantity in about three weeks may be advisable.

## PATCH TEST FOR ANTIMONY

To the Editor—I have not had any experience with patch tests for dermatitis. I would appreciate your advice concerning the use of patch tests for workmen for the Texas Mining and Smelting Company. This company makes antimony—the only smelter in North America and probably the only one outside of China. I have had several cases of dermatitis resulting from handling antimony. How would you prepare the test?

J. A. Simpson, M.D., Laredo, Texas

ANSWER—The handling of antimony and its compounds is an occasional cause for contact dermatitis. All workmen who are exposed and all new applicants who will be exposed should be tested by the patch or contact method. A piece of cotton or gauze about  $\frac{1}{2}$  to 1 inch square is dipped in an aqueous solution of 2 per cent antimony chloride and is applied to a clear spot on the arm or back. The dressing is protected by a piece of cellophane and held by two strips of adhesive tape. The patch is removed at the end of forty-eight hours (sooner if well defined dermatitis results). A positive test is indicated by a redness or vesiculation or both at the site of the contact of the skin and the antimony chloride. As a control test, similar procedures should be carried out on the arms of the doctor and nurse, who are presumably not especially exposed to the metal. If the control tests are positive the solution is too strong, but Sulzberger (Dermatologic Allergy, Springfield, Ill., C. C. Thomas, 1940, p. 442), states that 2 per cent antimony chloride solution is the correct strength and that it is not a primary irritant, in other words, it will not cause dermatitis to all but only to those who happen to be allergic to it.

## SODIUM CACODYLATE FOR VINCENT'S ANGINA

To the Editor—In The Journal, March 14, 1942, page 936, there is an article on the use of sodium cacodylate. I should like to know if sodium cacodylate is indicated in the treatment of Vincent's angina either for treatment or for prevention. I have been using sodium cacodylate for many years before a tonsil operation and after. Several of my doctor friends also use this. We have found that it has cut down postoperative soreness and hemorrhages to a high degree. I should like to know the indications for use and results in Vincent's infection. I like this product for use in this manner and I am afraid that the manufacturers will discontinue making this in ampule form after seeing the article referred to.

D. H. Anthony, M.D., Memphis, Tenn.

ANSWER—Sodium cacodylate along with other arsenicals is still rather widely employed in the treatment of Vincent's angina, although in recent years its value has been discounted in favor of active local therapy. It is not likely that the manufacture of this preparation will be discontinued as long as there continues to be a demand for this form of arsenic for injection. The Council on Pharmacy and Chemistry has voted to omit this type of product from N. N. R. because of the lack of evidence to justify its continued use.

## FENESTRATION OPERATION FOR OTOSCLEROSIS

To the Editor—I have a patient, aged 30, with otosclerosis. During the past two years his hearing has become worse. He has heard about the operation for otosclerosis which Lempert has popularized recently. Could you give me further information as to its value?

M.D., New York

ANSWER—The fenestration operation for otosclerosis is being done by a number of otologists in this country with encouraging results. The published reports are summarized in the February 1942 issue of the *Archives of Otolaryngology*. Before considering the operation, the patient must have a good nerve of hearing as determined by the bone conduction tests. He must understand that the operation is still new. Late results ten or twenty years after are not yet known. It is not always successful, and there is the possibility that the hearing in the ear that is operated on may be made worse. In competent hands there is a better than 50 per cent chance of a lasting substantial hearing improvement in suitable cases, judging by the published reports.

## NODULES OF RHEUMATOID ARTHRITIS

To the Editor—Please discuss the pathogenesis, histology and clinical significance of the fibrous skin nodules which are found associated with chronic arthritis. How would you differentiate them clinically and histologically from the juxta-articular nodules of late syphilis?

M.D., New York

ANSWER—The subcutaneous nodules of rheumatoid arthritis are found in about 20 per cent of the cases and constitute a pathognomonic lesion of this disease discernible on physical examination. They are most commonly found over the olecranon or distal to it. Other sites are the tendons of the fingers, knees, feet, wrists and ankles, the base of the skull and the area over the spinous processes. They are occasionally found on the thoracic wall or over the scapulas. One cannot differentiate them clinically from the juxta-articular nodules of syphilis. However, they can be distinguished from one another on micro-

scopic examination. The nodules of rheumatoid arthritis have three reasonably well defined merging zonal areas: (a) the central zone, or zone of necrosis; (b) the intermediate zone, comprising proliferating cellular tissue, the cells of which may or may not be regularly oriented (palisading); and (c) the peripheral zone, consisting of the inflamed tissues in which the nodule develops. Exudation is rarely a prominent feature of these lesions. Aschoff-like nodules are rarely if ever seen. The pathogenesis and cause of these lesions remain unknown.

## ROENTGENOGRAPHIC DETECTION OF A SWALLOWED ERASER

To the Editor—A boy aged 8 years accidentally swallowed an eraser on Sept. 25, 1941. He was placed on a soft diet. The parents were instructed to watch the stools. On the following day a flat roentgenogram demonstrated a definite shadow 1.5 by 4.5 cm. on the right side in the region of the ileocecal valve. He still had no complaints, temperature, respiration and pulse being within normal limits. The third roentgenogram was taken on the following day and of this time, no trace of a shadow could be found. On the following day two more roentgenograms were taken, one high enough to include the diaphragm and the lower parts of the lungs. The second was low enough to include the upper third of the femurs. No shadow was found corresponding to the first picture. Why did we get a shadow the first day, while the remaining three plates failed to find it? The stools have all been examined carefully even up to date.

M.D., Missouri

ANSWER—This query cannot be answered satisfactorily because common school erasers vary considerably in the amount of mineral content. They seldom contain enough metallic salts to give high x-ray contrasts when lying in the stomach or bowel. Pure rubber defies detection, whereas red rubber tubing is easily visible because of the mineral oxides used in manufacture. In dealing with a common eraser swallowed by a child it might be visualized in a film of critical quality, whereas in one less critical it could be entirely missed. It could be further obscured by overlap of osseous structures.

## SMALL BREASTS

To the Editor—A woman aged 20 complains of lack of bust development. She weighs 107 pounds (48.5 Kg.), is 5 feet 2 inches (157.5 cm.) tall and menstruates regularly. One sister older and one younger have the same degree of development. Her breasts are rather small.

M.D., Colorado

ANSWER—It is inadvisable to attempt to stimulate the development of the breasts in this case. The only conditions under which breast growth may be stimulated are those in which the ovaries are not functioning, as in sexual infantilism or in amenorrhea due to underfunctioning of the ovaries. In these states the application of estrogens, either locally in the form of ointment or by other routes, will cause an increase in the size of the breast while treatment is continued. Regression occurs following cessation of treatment. In women who are menstruating regularly estrogen therapy is of doubtful value in bust development and may easily derange the regularity of the menstrual cycles. In such women apparently the breast tissue is scanty.

## DUSTING POWDER FOR TRICHOPHYTOSIS

To the Editor—A paper by D. T. Prehn in The Journal, Aug. 20, 1933, included a formula (salicylic acid 5 Gm., menthol 2 Gm., camphor 8 Gm., boric acid 50 Gm. and starch 35 Gm.) for a powder for use in mycotic infections of the skin. I have used this powder in some cases but find it difficult to use because it is hygroscopic. In the climate of Hawaii the powder becomes so moist that it forms a paste. I wish to know whether some modification of this powder might render it more satisfactory for general use or if some other more satisfactory formula for a good powder for use in the treatment of trichophytosis is known.

M.D., District of Columbia

ANSWER—In the preparation of the formula of Prehn, it is essential that the menthol and camphor are mixed separately so that no liquefaction takes place, and that the starch is very dry and moisture free. A satisfactory formula for a good powder for use in the treatment of trichophytosis is: thiosulfate 6 Gm. and boric acid 24 Gm.

## ULTRAVIOLET BURNS OF THE EYE

To the Editor—In Queries and Minor Notes (The Journal, April 4, 1943) I note with interest the query of Dr. Jonas S. Friedenwald concerning ultraviolet burns of the eye. For the past several months I have been treating a treatment in cases of this type with a great deal of success. The treatment is not original with me, but I am not able to recall the source from which it was obtained. The treatment is as follows: One or two drops of 1 per cent pontocaine is instilled in each eye after which the patient sits before an infra-red lamp at a distance of approximately 18 inches and gazes steadily at the lamp for a period of twenty minutes. This is sufficient for practically all such "flesh" cases, and in some cases which relief is not obtained the process is repeated in two hours. I have successfully employed this treatment in several hundred cases of ultraviolet workers and have not seen a case in which it did not work.

## COCCIDIOIDAL GRANULOMA (COCCIDIOIDOMYCOSIS)

ITS INCIDENCE IN MAN AND ANIMALS AND  
ITS DIAGNOSIS IN ANIMALS

GEORGE W. STILES, M.D., PH.D.  
AND  
CHARLES L. DAVIS, D.V.M.  
DENVER

The increasing importance of coccidioidal infection is apparent to workers in medical science, judging from available literature on the subject. Since the first discovery of human coccidioidal granuloma in South America by Wernicke (1892),<sup>1</sup> and in California by Rixford (1894)<sup>2</sup> and Giltner's<sup>3</sup> discovery of the disease in California cattle, the general conception of the malady has changed materially.

Our purpose in this paper is to correlate available data on the nature, incidence and geographic distribution of coccidioidal granuloma, designated "coccidioidomycosis" by Dickson,<sup>4</sup> in both man and animals. A conception of the human phase of the disease is quite incomplete without coordinating the physician's researches on human beings with the veterinarian's investigations on lower animals. To the physician, veterinarian or other scientist interested in coccidioidal infection a wealth of literature is available. A monograph was prepared for the California State Board of Health<sup>5</sup> in which are cited one hundred and seventy-two references.

### THE DISEASE IN MAN

A highly fatal disease in man known as coccidioidal granuloma was recognized for many years in central California, while in the same locality a nonfatal influenza-like disease existed also and was known locally as "valley fever," "desert fever," "desert rheumatism," or "San Joaquin Valley fever." The relationship of these two diseases was not recognized until 1936, when the work of Dickson and Gifford<sup>6</sup> showed that the two maladies were caused by the same organism, *Coccidioides immitis*.

The discussion of coccidioidal infection in man should be considered from two points of view: first the primary, acute, uncomplicated type with low mortality, known as "valley fever," and, second, the more commonly known, highly fatal chronic form, coccidioidal granuloma.

### VALLEY FEVER

In its initial stage "valley fever" resembles influenza and is followed in a few days by the eruptive phase of erythema nodosum in about 5 per cent of the cases, and less frequently by erythema multiforme. The cutaneous lesions are often associated with arthritis, sore throat and conjunctivitis. The disease may be confused with pneumonia, tuberculosis, pleurisy, smallpox, measles, tularemia, syphilis and typhoid and rarely with poliomyelitis. All ages of both sexes are susceptible, fortunately, however, the mortality is negligible.

Smith<sup>6</sup> reports that thousands of migratory workers in California have acquired coccidioides infection during recent years, according to clinical observations, laboratory examinations and coccidioidin skin tests. Newcomers appear more susceptible to the benign infection than do native or old time residents, who may have acquired a degree of immunity to the disease through previous coccidioidal infection. Smith also states that an investigation was made of 432 patients with "San Joaquin fever" in Kern and Tulare counties during the seventeen months beginning December 1937. All recovered without sequelae.

### COCCIDIOIDAL GRANULOMA

As commonly known, coccidioidal granuloma in human beings is a chronic, progressive, highly fatal fungous disease affecting the lungs, skin, lymph nodes, bones, meninges, thoracic viscera and other body tissues. Kessel<sup>7</sup> says that 70 per cent of the cases occurring in the Los Angeles County Hospital indicate that the initial lesion is in the lung. In contrast to the wide distribution of the lesions observed in man, the infection in cattle has thus far been confined to the thoracic lymph nodes and the lungs. Coccidioidomycosis in man is a close mimic of tuberculosis and frequently may be mistaken for that disease, however, the exclusion of acid-fast organisms and the recovery of the fungus from the sputum or body tissues should verify the diagnosis. Microscopic examination often discloses otherwise unsuspected cases. Dickson says that frequently the diagnosis is tuberculosis clinically, but on gross examination of sectioned tissues the true diagnosis is found to be coccidioidal granuloma.

Involvement of the joints in both benign and chronic types of coccidioidomycosis is reported by Rosenberg and his co-workers<sup>8</sup> at the Mayo Clinic. While the joint involvement in these cases of mild involvement usually subsided, in the serious phase of the disease the affected joints often resulted in generalized fatal infection.

#### MODE OF TRANSMISSION

There is at present no evidence that man to man, animal to man or animal to animal infection occurs under natural conditions yet the disease may be readily transmitted experimentally from infected tissues to laboratory animals. The danger arising from handling diseased tissues or coccidioides cultures should be recognized.

Pulmonary infection may be acquired by inhalation of the vegetative phase of dust laden chlamydospores.

Fig. 1—A, B, C, involved lymph nodes showing the variation in size and location of the granulomatous areas. Note the distinct encapsulated foci in B, also the striking resemblance to tuberculosis lesions. D, granulomatous areas in the lung containing a number of encapsulated foci. Somewhat reduced from photographs with a magnification of  $1\frac{1}{2}$  diameters.

This mode of infection was verified accidentally by a laboratory technician who inhaled sporulating cultures. The vegetative form of the fungus is believed to exist more frequently during rainy periods in arid regions where the winters are relatively warm and the summers are hot, dry and dusty. By special mediums and laboratory technique, Stewart and Meyer<sup>9</sup> recovered the coccidioides spores from the soil on a California ranch on which human infections had been diagnosed. Reporting an epidemic of coccidioid infection among a party of students and faculty members of Stanford

University, Davis and his associates<sup>10</sup> comment regarding the likely source of infection through inhaling spore-laden dust during the collection of specimens in the vicinity of a rattlesnake hole. Later examination of the soil from the same area revealed the presence of *Coccidioides immitis*. Abrasion of the skin may be a route of infection, and in rare instances the disease may be acquired by the gastrointestinal tract.

#### GEOGRAPHIC DISTRIBUTION

In 1931 Beck<sup>11</sup> reported 286 human cases of chronic coccidioid granuloma. Of these, 254 occurred in California and 16 in other states—Arizona, Colorado, Illinois, Kansas, Missouri, Nebraska, New Mexico, Pennsylvania, South Carolina, Texas and Washington. 14 cases occurred in South America and 2 in Italy. Other localities reported by Miller<sup>12</sup> in 1936 are Alaska, Tennessee, Louisiana and Hawaii. Evans and Ball<sup>13</sup> report 1 human case in Old Mexico. Kessel<sup>7</sup> says

Between the years of 1893 and 1939, 660 cases of coccidioidosis have been reported to the California State Department of Public Health. The actual geographical origin of the infections is not known in all cases but the majority of the reported cases originate in the southern portion of the San Joaquin Valley. Of 100 cases of coccidioid granuloma observed in the Los Angeles County Hospital in recent years, 51 probably originated in the San Joaquin Valley, 31 in southern California and 8 in Arizona, New Mexico or Texas. Dr. J. D. Aronson of the U. S. Office of Indian Affairs recently tested 140 Indian children on the Pima Reservation near Phoenix, Ariz., with coccidioidin from our laboratory and reports that 90 per cent of them developed a positive reaction.

A new area of primary coccidioid infection in the vicinity of Camp Roberts, California, is reported by Shelton,<sup>14</sup> who found 14 infected soldiers from among 736 recruits recently stationed at that camp. These infected men gave a negative reaction to the coccidioidin skin test on arrival. However, after three months' stay their reaction to the test became positive.

In Texas, Smith<sup>15</sup> reports a case of coccidioid infection occurring in a man living in the vicinity of El Paso who had never been in California. From Texas, also, Caldwell<sup>16</sup> reports 3 proved cases from the Dallas area and 3 more human infections since the publication of his article. At San Angelo, Texas, Schulze<sup>17</sup> reports that 18 per cent of 100 private patients reacted to the coccidioidin skin test. All these reactors were ranch men none of whom had ever visited the San Joaquin Valley. Three cases of the acute "valley fever" type infection and 9 cases of the granulomatous disease arising in western Texas are mentioned by Schulze<sup>17</sup> having been reported by other observers.

In the vicinity of Phoenix, Ariz., Phillips<sup>18</sup> states that he found 10 per cent of the older residents of the

9 Stewart, R. A., and Meyer, K. F. Isolation of *Coccidioides immitis* (Stiles) from the Soil. *Proc. Soc. Exper. Biol. & Med.* 29: 937 (May) 1932.

Salt River Valley gave positive coccidioidin reactions. Many of these persons were from rural areas in contact with livestock but, curiously enough, the largest incidence of positive reactors were found not among cattlemen but among men who handled sheep.

Mills and Farness<sup>19</sup> cite the case of a 15 year old boy attending a private school near Tucson, Ariz., who showed cavitation of the lungs on roentgen examination. The continued absence of acid-fast organisms, high eosinophilia and general absence of fever prompted the more thorough examination of the sputum, which resulted in recovery of a fungus recognized as *Coccidioides immitis*. The finding of this positive case stimulated these physicians and a dozen or more clinical diagnoses came to their attention. Intradermic coccidioidin tests on 60 Arizona patients in the Pima County Hospital showed that 20 per cent gave a positive reaction. Similar results were obtained in other groups of patients. Farness<sup>20</sup> cites 5 human cases apparently arising in Arizona.

The latest published articles and personal communications (1942) indicate that at least 790 cases of chronic coccidioidal granuloma have been recognized in human beings. Of this number, Wynns,<sup>21</sup> who is epidemiologist of the California State Board of Health, reports a mortality of nearly 40 per cent in 744 California cases of this highly fatal chronic form of the disease. His report includes Beck's 254 cases.

The senior author (G. W. S.) has observed but 1 human case of coccidioidomycosis at the Colorado General Hospital, reported by O'Toole<sup>22</sup> and originating from California. Physicians concerned with the treatment of this disease may find valuable suggestions in our bibliography.<sup>23</sup>

The data herein cited indicate not only that the disease in man is recognized in California but that it is becoming an important public health problem in many other localities.

#### THE DISEASE IN ANIMALS

While the greatest interest in coccidioidal infections has centered in human medicine, the veterinary phase of the problem has its place in relation to public health and animal welfare. Cummins and his associates<sup>24</sup> make a direct plea to the veterinarian, the physician, the internist, the surgeon and the pathologist for a closer cooperation and a more thorough investigation of this important disease in its relation to man and the lower animals.

Pulford and Larson<sup>25</sup> state that the ever widening distribution of coccidioidal granuloma forces one to

the conclusion that the disease is either spreading or is becoming better recognized by the medical profession and that it should no longer be called the "California disease." Smith<sup>26</sup> believes that the discovery of coccidioidal granuloma in cattle should be of great value in locating new foci of infection.

A variety of animals may be sources of coccidioides infection. Emmons<sup>27</sup> of the U. S. Public Health Service recovered the fungus in 25 of 105 trapped rodents representing six species in the vicinity of San Carlos, Ariz. Spores of the fungus were also found in the soil of this locality, possibly arising from animal contamination.

From Tucson, Ariz., Farness<sup>28</sup> reports a case of coccidioidal infection occurring in a great Dane dog. Later in a personal communication he cites 5 additional canine cases diagnosed either by cultural methods or by human coccidioidin applied as a cutaneous test. Farness also has 2 cats under observation in which he suspects coccidioidomycosis.

Fig. 2—Press preparation of the purulent contents of a lymph node lesion illustrating spherules with distinct double contour capsule.  $\times 600$

Another canine case occurring in a 2 year old male English setter is reported in Canada by Plummer<sup>29</sup> and Radmore.<sup>30</sup> The dog in question was raised in Canada and was mated with a female setter from California. In sections, coccidioidal spherules were demonstrated in large numbers in the lung and brain tissues. Although the lungs grossly resembled tuberculosis, evidence of acid-fast organisms was not demonstrated.

While engaged in the diagnosis and treatment of human coccidioidal infections in Arizona, Phillips<sup>31</sup> called attention to a condition in sheep resembling coccidioidal granuloma.

In a band of 56 sheep kept for three years near Phoenix, 30 head gave positive reactions with 0.1 cc

of human coccidioidin administered under aseptic conditions. After this several sheep became ill with temperatures of 105 F or higher, and in 2 abscesses developed in the axillary lymph nodes. Aspirated pus from the softened lymph nodes was cultured, resulting in the recovery of a fungus-like organism which on inoculation killed male guinea pigs with septicemia. The tentative conclusion was that a variant of *Coccidioides immitis* was present in the Phoenix district, that it affects sheep in particular and that it produces a nonfatal, usually undiagnosed illness in human subjects. He further states that open ulcers persisted for one year on three of the sheep mentioned. These sheep were destroyed without further laboratory examination.

Beck in 1929 reported a single positive case of coccidioidial granuloma in sheep.

#### COCCIDIOIDAL GRANULOMA IN CATTLE

During the past ten years 78 positive cases of coccidioidial infection in bovines were diagnosed in the laboratory of the Denver Bureau of Animal Industry which originated from localities as follows: California 62, Arizona and Texas 5 each, Old Mexico 4, Colorado<sup>32</sup> and New Mexico<sup>33</sup> 1 case each. These definitely diagnosed cases represent many additional cases in lots sent for slaughter when only representative samples from a lot were sent to the laboratory for examination. For example, in one lot 6 specimens were submitted with the statement that 45 steers were similarly affected. In another instance a single specimen was submitted with the notation that 36 steers from the San Joaquin Valley showed similar lesions.

With few exceptions these tissues were from cattle slaughtered at federally inspected abattoirs<sup>34</sup>. Their origin and probable source of infection were traced through shipping records in practically all instances. This group consisted of 32 male animals, 33 females and 13 in which the sex was not given.

Two 8 to 10 month old calves were the youngest animals noted that showed coccidioidial infection<sup>35</sup>.

Fig 3—Single colony of *Coccidioides immitis*, showing a cotton like growth on solid medium,  $\times 2$

Thirty-nine cattle were from 10 months to 3 years old, 17 were past 4 years and the ages of the remaining 22 were unknown. The lesions were distributed as follows: bronchial lymph node only in 21 animals, mediastinal lymph node only in 21 animals, bronchial and mediastinal lymph nodes in 13 animals, pulmonary lesions with lymph node involvement<sup>36</sup> in 8 animals and in 15 animals the location of the lesions was unidentified.

#### CATTLE CASES REPORTED BY OTHERS

In 1918 Giltner reported the first cases of coccidioidial granuloma in bronchial and mediastinal lymph nodes from cattle slaughtered at San Diego, Calif. From these tissues *Coccidioides immitis* was recovered on

Fig 4—Hanging drop preparation of the mold, showing intricate net work of mycelia,  $\times 200$

culture, and pathogenicity was determined by successful experimental injections into guinea pigs, rabbits, dogs, cattle, sheep and swine.

During 1931 Beck reported 10 cases of coccidioidial infection occurring in cattle in addition to 9 other bovine cases previously reported. During the period from Dec 17, 1938 to Feb 6, 1939, Bengston,<sup>37</sup> in charge of the bureau's pathologic laboratory at Chicago diagnosed 20 cases of coccidioidial granuloma from California and Texas cattle aged from 1 year upward. Steers, cows and bulls were affected. In 16 cases the mediastinal lymph nodes only were involved, in 3 cases the bronchial lymph nodes and in 1 case the bronchial lymph nodes and lungs were infected.

From the bureau's laboratory in Washington D. C. Schoening<sup>38</sup> reports several positive cases of coccidioidial granuloma during recent years. A summary of the data now at hand shows a total of 116 definite diagnosed cases of bovine coccidioidial granuloma in the United States. However, it is probable that many more cases in cattle have escaped identification or were not submitted for laboratory confirmation.

#### LABORATORY MANIFESTATIONS OF BOVINE LESIONS

In the study of the diseased tissues as they occur in the bovine, it is possible to observe different stages in the development of the lesions. Cattle affected with coccidioidial granuloma show no clinical symptoms and, as has been previously mentioned, the lesions thus far observed have been confined to the thoracic lymph

37 Bengston, J. S. Coccidioidial Granuloma (in F. H. Animal.) The Bureau of Veterinary 15: 14 (May) 1937.

38 Schoening, H. C. Personal communication to the author, 1942.

and the lungs and are detected only when the animals come to slaughter. In the purulent stage of the affected lymph nodes all or part of the tissues may be involved. In this stage the node is enlarged and on incision is found to contain a pale, yellowish tenacious pus, granular in consistency and resembling somewhat actinomycotic material. It is not uncommon to find the tissue traversed by many trabeculous striations imparting a honeycomb appearance to the wall of the abscess with the formation of pus pockets.

The purulent stage is followed by granulomatous changes in which the contents have a cheesy consistency resembling somewhat the caseous lesion of tuberculosis (fig 1). In this stage the lesion is walled off from the uninvolved lymphoid tissue by a connective tissue capsule and contains several encapsulated foci with purulent centers. Calcareous deposits are found in the older lesions. Grossly, the lesions of coccidioidal granuloma in cattle may be confused with tuberculosis, actinomycosis, actinobacillosis or abscesses due to *Corynebacterium pyogenes*. Laboratory examination of the suspected material is often necessary to make a correct diagnosis.

The 78 bovine cases reported herein were diagnosed in the Denver laboratory either by the demonstration of spherules in press preparations of the purulent contents, positive cultures of *Coccidioides immitis* being obtained or by microscopic sections. In many instances all three methods of diagnosis were employed. Cover slip preparations of the purulent contents of the affected lymph nodes disclose spherical bodies with a retractile, double contoured capsule (fig 2). The parasites may vary in size from 10 to 50 microns. Occasionally the spherules are seen surrounded by distinct rosettes with clubs radiating out from the capsule which aids in the differential diagnosis from actinobacillosis and actino-

4) In the tissues however, the organisms appear only in the spherical form.

Microscopic study of sections of the lesions stained with hematoxylin-eosin show a granulomatous process consisting of connective tissue, blood vessels, lympho-

Fig 6—Section of a purulent area demonstrating a rosette formation surrounding the parasite.  $\times 500$

cytes, plasma cells, mononuclear and polymorphonuclear leukocytes, a few eosinophils and giant cells. Scattered throughout the tissue are seen variable numbers of double contoured spherules, the majority of which have been taken up by giant cells (fig 5). Usually a single parasite is seen within a giant cell, but as many as six spherules have been noted within a single giant cell in some sections. Some of the parasites which are presumably the more recent sporulating forms, often show a strong affinity for eosin. Occasional spherules show ruptured walls, and in some sections one or more parasites may be surrounded by a group of eosin-staining radiating clubs forming a well defined rosette (fig 6). In some fields the cellular reaction mimics a tubercle and only the presence of the spherules within the giant cells or in the tissue enables a differentiation from a tuberculous process. In some instances it may be necessary to cut blocks from different portions of the lesion in order to demonstrate the spherules in the tissues.

#### SUMMARY

1 Coccidioidal granuloma appears to be acquired by inhaling spores of the fungus by cutaneous infection through wounds or rarely through the gastrointestinal route.

2 While coccidioidal granuloma has been considered peculiar to California its appearance both in man and in animals from other localities indicates that the malady is either spreading or has not heretofore been recognized.

3 Coincident with this disease in man an increase is noted in the number of cases occurring in lower animals. In regions in which man has acquired infection cattle, dogs, sheep, wild rodents and possibly other animals may harbor the fungus.

U. S. Custom House, Room 517

mycosis. Cultures from the pus on meat-inoculation agar will yield a growth of *Coccidioides immitis* after incubation for from forty-eight to seventy-two hours at 37°C. The mold on solid mediums produces white cotton-like colonies (fig 3). Hanging-drop preparations from the growth show an intricate network of mycelia (fig

PATHOLOGIC LESIONS PRODUCED  
BY SULFATHIAZOLE

REPORT OF FOUR FATAL CASES

WALTER C MERKEL, MD  
Pathologist, Union Memorial Hospital, Assistant Professor of Pathology  
University of Maryland School of Medicine

AND

ROBERT C CRAWFORD, MD  
Resident in Medicine Union Memorial Hospital

BALTIMORE

We are presenting 4 fatal cases of sulfathiazole treatment in which autopsy revealed histopathologic lesions not characteristic of any previously described disease process. Rake, Van Dyke and Corwin<sup>1</sup> described identical pathologic lesions in their experimental work on mice inoculated with sulfathiazole. They stated that 77 per cent of the mice given a 2 per cent sulfathiazole diet died during a four week period and that the lesions were

tolic and 100 diastolic. The physical examination was otherwise noncontributory. The content of nonprotein nitrogen, cholesterol and total protein in the blood was normal on admission, as was the carbon dioxide combining power. The membranes were ruptured, and a normal delivery followed three hours in labor. Immediately after delivery the blood pressure was 140 systolic and 90 diastolic. The albuminuria and edema promptly disappeared. The further clinical course is shown in the accompanying table. On the eighth postpartum day 150 grains (9 Gm) of sulfathiazole was given because of the presence of a mild infection of the upper respiratory tract. On the fifteenth postpartum day a diagnosis of probable drug fever was made. Sixth molar sodium lactate solution and other fluids were forced. The carbon dioxide combining power of the blood was raised to 73 volumes per cent as a result of the lactate therapy. On the eighteenth postpartum day 90 grains (6 Gm) of sulfathiazole was given (15 grains [1 Gm] every four hours for six doses) after a chill, a temperature of 105 F, tenderness in the right costovertebral angle and clumps of white blood

chiefly in the spleen and the genitourinary tract. They reported tuberculous-like lesions in sulfathiazole treated monkeys; they attributed these lesions to tuberculosis. However, in the kidneys from these monkeys they demonstrated crystals surrounded by leukocytic zones. The microscopic lesions are so similar to the focal necrosis seen in infections that no doubt many cases since the introduction of the drug have been overlooked. To report, we selected 4 cases in which we feel that the lesions were clearcut and could not be confused with lesions produced by septic infection. The histories do not suggest septicemia. Bacterial stains revealed no organisms. All blood cultures were negative.

CASE 1—History—Mrs. K. B., aged 32, was admitted to the maternity ward of the Union Memorial Hospital April 18, 1941, with hypertension, albuminuria and pitting edema of the lower extremities complicating a full term pregnancy. She had previously had two full term pregnancies, each complicated with toxemia. On admission her blood pressure was 180 sys-

tolic and 100 diastolic. The physical examination was otherwise noncontributory. The content of nonprotein nitrogen, cholesterol and total protein in the blood was normal on admission, as was the carbon dioxide combining power. The membranes were ruptured, and a normal delivery followed three hours in labor. Immediately after delivery the blood pressure was 140 systolic and 90 diastolic. The albuminuria and edema promptly disappeared. The further clinical course is shown in the accompanying table. On the eighth postpartum day 150 grains (9 Gm) of sulfathiazole was given because of the presence of a mild infection of the upper respiratory tract. On the fifteenth postpartum day a diagnosis of probable drug fever was made. Sixth molar sodium lactate solution and other fluids were forced. The carbon dioxide combining power of the blood was raised to 73 volumes per cent as a result of the lactate therapy. On the eighteenth postpartum day 90 grains (6 Gm) of sulfathiazole was given (15 grains [1 Gm] every four hours for six doses) after a chill, a temperature of 105 F, tenderness in the right costovertebral angle and clumps of white blood cells in the urine had been observed. The diagnosis was probable pyelitis. On the nineteenth postpartum day lactate solution and other fluids were forced to combat uremia and acidosis. On the twentieth postpartum day, coma, a rise in the pulse rate and a drop in the blood pressure came on suddenly. Death occurred one-half hour after the onset of coma. The fluid intake averaged 3,500 cc each day and the urinary output 1,500 cc. The blood cultures were repeatedly negative. The drug rash consisted of small red nodules on the face, neck, chest and forearms. Autopsy—Most of the normal observations are contained in this report. Gross Examination. A recent, unhealed orificial sinus wound was present. There was no jaundice or other abnormal manifestations. All the serous cavities contained a colored fluid, 1,000 cc was removed from the peritoneal cavity and each pleural cavity contained about 800 cc. Examination of the visceral cavities was unimportant except for the bilateral fibrous pleural adhesions. The lungs were dark, air containing and of normal color except along the periphery, where a purplish tinge and a doughy consistency were present. Both lungs were crepitant to palpation. The mediastinal nodes were not unduly enlarged. The surface of the lungs presented a reddish gray color speckled with milium pin head size grayish white nodules.

From the Department of Pathology of the Union Memorial Hospital, Baltimore.  
Dr. Arnold R. Rich of the Johns Hopkins Hospital, gave permission for use of the last 2 cases. Dr. Warfield T. Longcope, of the Johns Hopkins Hospital, assisted in the preparation of this paper.  
1. Rake, Geoffrey, Van Dyke, H. B., and Corwin, W. C. Pathologic Changes Following Prolonged Administration of Sulfathiazole and Sulfapyridine, *Am. J. M. Sc.* 200:353 (Sept.) 1940.

These were encountered in all the lobes. Grossly, one was impressed by the sharp demarcation of these grayish areas which were not surrounded by hemorrhagic zones. The lungs

Fig 1 (case 1)—Lymph node showing the thick edematous capsule infiltrated with leukocytes and the sharply defined area of necrosis and accumulated polymorphonuclear cells  $\times 100$

Fig 2 (case 1)—Lymph node with higher magnification showing necrosis and polymorphonuclear cells more clearly  $\times 200$

did not show any excess of edema. They were light in weight for their volume and readily floated in water. The patchy necrosis grossly resembled tuberculosis but no scars or focal lesions of tuberculosis were encountered anywhere.

The heart was normal except for a moderate increase in the pericardial fluid.

The peritoneal cavity presented many large lymph nodes in the folds of the mesentery and in the omentum. These averaged from 1 to 2 cm in diameter. They were not only encountered by palpation but could be seen as dome shaped elevations along the mesenteric fold. The cut surface presented necrotic pulp. Many of them had actually undergone softening to form a creamy fluid. There were no adhesions.

The spleen weighed 425 Gm. The consistency was doughy, and the cut surface presented a gray, mushy parenchyma.

The kidneys weighed 175 Gm each. They were normal in shape. Multiple petechial hemorrhages were seen through the capsules. The cut surfaces presented a moist parenchyma characterized by hyperemia together with miliary hemorrhages. A gritty substance was distributed throughout the parenchyma. The concretions were translucent and typical of crystals. The mucosa of the pelvis showed no hemorrhage or exudate. The pelvic mucosa contained many crystalline deposits. The bladder showed no evidence of inflammation.

Fig 3 (case 1)—Spleen showing areas of focal necrosis destroying the greater part of the malpighian bodies and the reticulum saturated with polymorphonuclear cells  $\times 100$

The uterus was the size of an orange and typical of the postpartum period. The cavity contained shreds of retained placenta.

Exploration of the skull cavity revealed no gross pathologic changes and the brain showed nothing abnormal except hyperemia of the meninges.

**Microscopic Examination.** The lungs showed edema and moderate hyperemia. Throughout all the lobes there were small necrotic areas characterized by accumulations of polymorphonuclear cells. The parenchyma was necrotic in these areas. In fact many areas showed merely necrosis with relatively few polymorphonuclear cells except along the margin of the necrosis. There was no fibrosis. Bacterial stains revealed no tubercle bacilli or other organisms.

The bone marrow including that of the ribs and the femurs was also characterized by distinct areas of necrosis and by massing of leukocytes into nests which either displaced the marrow or necrotized it. In addition to the presence of polymorphonuclear cells there was definite fragmentation of cells. Large mononuclear cells contained cell particles.

The kidney sections showed areas of necrosis and nests of polymorphonuclear leukocytes apparently more numerous in

the medullary portion of the kidneys than in the cortex. The predominating cells were polymorphonuclear. Some necrotic areas showed erosion of the vessel walls, and in several vessels the necrosis extended through the wall into the lumen, which

Fig. 4 (case 1)—Liver showing focal necrosis characterized by accumulation of polymorphonuclear cells  $\times 200$

Fig. 5 (case 3)—Kidney showing sharply defined area characterized by coagulation necrosis and accumulation of polymorphonuclear cells  $\times 100$

in turn was occluded by a thrombus. Many of the thrombi contained nests of polymorphonuclear cells. The necrotic areas were not confined to any particular structure. They were seen in the glomeruli, in the conducting as well as the convo-

luted tubules and even in the capsule of the kidney. The greater number of necrotic areas, however, were confined to the medulla.

In the adrenal glands similar areas of necrosis were encountered in the central zones.

In the lymph nodes, two rather distinct types of lesion could be demonstrated. One was characterized by a coagulation necrosis, well defined and not infiltrated with leukocytes. Areas of this type were so numerous that there was considerable occupying large areas of the lymphoid stroma. Other areas were characterized by displacement of the lymphoid tissue with nests of polymorphonuclear and phagocytic cells.

The spleen showed a process similar to that described for the lymph nodes. The characteristic lesions were encountered chiefly near the malpighian bodies.

The uterus, heart and bladder were essentially normal except for remnants of decidual and placental tissue within the uterine cavity.

The pancreas presented areas of necrosis.

Fig. 6 (case 1)—Kidney with higher magnification showing clearly the destruction of parenchyma and accumulation of polymorphonuclear cells  $\times 200$

The liver sections showed military and distinct areas of focal necrosis, some of which were infiltrated with polymorphonuclear cells.

In the brain, many thrombotic emboli were seen in the vessels. Within some of the thrombi there were necrotic areas. Occasional areas of disintegration and accumulation of polymorphonuclear cells were encountered. These were interpreted as infarctions.

**Bacteriologic Examination.** Bacterial stains were made on the sections were studied by Dr. Hugh Spencer, University of Maryland, and Dr. Arnold Rich, the Johns Hopkins Hospital. Their opinions coincided with ours, that the areas of necrosis were of a nonbacterial type.

**Anatomic Diagnosis.** This was as follows: (1) hemorrhagic and diffuse nephritis with precipitation of casts and areas of military focal necrosis, (2) military focal necrosis of the lungs, lymph nodes (mesenteric), pancreas, adrenals and bone marrow, (3) generalized edema, (4) bilateral pleural effusion, (5) peritoneal effusion, (6) recent pelvic hyperemia (infection), (7) postpartum condition of the uterus and embolism and infarction.

**CASE 2—History**—A Negro woman aged 73 admitted to the Provident Hospital April 30 1941 two days before had had intermittent excruciating pains in the right upper quadrant. Profuse constant vomiting occurred on the day previous to admission. Five years before admission the patient had had a renal calculus which she had passed after an attack of severe renal colic.

On admission the temperature was 98 F the pulse rate 110 the respiratory rate 20 and the blood pressure 160 systolic and 100 diastolic.

Physical examination revealed that the patient was obese and was oriented coherent and cooperative but acutely ill. There was no jaundice no cyanosis no edema and no rash. The bones and joints were normal. Neurologic examination gave negative results. The head neck heart and lungs were normal. The abdomen was tender over the gallbladder and over the right costovertebral angle.

There was moderate muscle spasm on deep palpation over the gallbladder.

On April 11 and 12 the temperature varied between 104 and 106 F the pulse rate was 130 and the respiratory rate 40 to 45. A deep coma gradually developed followed by death. Further clinical details are not available.

Fig 7 (case 1)—Lung showing edema a distinct area of necrosis and a pool of polymorphonuclear cells  $\times 200$

**Laboratory Examination**—The urine showed a 1 plus reaction for albumin no sugar no acetone no red blood cells and no casts but numerous clumps of white blood cells. A blood count revealed 4160 000 red cells and 8900 white cells with 80 per cent polymorphonuclear leukocytes. The hemoglobin content was 88 per cent and the nonprotein nitrogen content 40 mg per hundred cubic centimeters. The icteric index was 5 and the phenolsulfonphthalein test revealed a retention of 40 per cent. A urine culture showed *Staphylococcus aureus* and *Esch coli*. Roentgenograms revealed a stag horn calculus in the pelvis of the right kidney.

**Course**—The patient was treated with sulfathiazole 645 grams (43 Gm) from April 2 to 10. The white cell count never exceeded 15 000 with 89 per cent polymorphonuclear leukocytes and there was no drop in the number of white cells. There was no agranulocytosis and no drop in the hemoglobin content of the blood. The concentration of sulfathiazole in the blood never exceeded 5 mg per hundred cubic centimeters. On April 8 9 and 10 the temperature varied between 100 and 101 F. It then rose to 103 F the pulse rate was 130 and the respiratory rate 40. Administration of the drug was

Fig 8 (case 2)—Lung showing area similar to that in case 1

Fig 9 (case 1)—Lung showing larger area of necrosis more advanced characterized by coagulation and destruction of parenchyma  $\times 200$

**Autopsy**—Gross Examination. External examination was essentially noncontributory. The serous cavities contained a moderate amount of watery fluid. All the viscera presented normal anatomic relations. The right lung adhered to the

thorax by means of dense adhesions. The lungs felt somewhat boggy, they showed many bright red hemorrhagic spots and also numerous small pale areas. Sectioning revealed that the lung was red, with blood tinged fluid flowing from it. There were, however, no areas of frank consolidation.

The heart weighed 410 Gm, otherwise it was normal.

The spleen was soft and wrinkled. The cut surface presented a mushy pulp.

The liver weighed 1,205 Gm, the cut surface was a pale reddish brown.

The gallbladder was normal.

The left kidney weighed 110 Gm. A stag horn calculus filled the pelvis. The pelvic mucosa of both kidneys was speckled with small petechial hemorrhages. The kidney parenchyma was swollen and edematous.

**Microscopic Examination** There is no need to give a detailed report of the pathologic observations, which except for the stag horn calculus in the left kidney were identical with those in case 1 in that miliary focal necrosis was encountered throughout the entire lung parenchyma, liver, kidneys and spleen. Bone marrow was not available for study.

**CASE 3—History**—A Negro man aged 73 was admitted to the Johns Hopkins Hospital July 18, 1941 with a complaint of severe epigastric heaviness, knifelike in character, which followed a heavy meal. There was no nausea or vomiting. There was a history of a 20 pound (9 Kg) loss of weight in the past six weeks. The patient was definitely jaundiced. There was a tender epigastric mass easily palpable. The blood pressure was 140 systolic and 100 diastolic. Physical examination otherwise gave negative results. A diagnosis of carcinoma of the head of the pancreas was made.

Fig 10 (case 1)—Rib showing large areas of coagulation necrosis with most of the cells in the necrotic area polymorphonuclear,  $\times 200$

**Course and Laboratory Study**—Examination of the urine gave negative results. A blood count showed 5,040,000 red cells, and there was 14 Gm of hemoglobin per hundred cubic centimeters. There were 6,200 white cells, with 58 per cent polymorphonuclear leukocytes. The sedimentation rate, corrected, was 24 mm an hour, the icteric index was 40, and the albumin-globulin ratio was 1.2. The total protein content was 6.4 mg, the nonprotein nitrogen content 32 mg and the fasting blood sugar content 100 mg per hundred cubic centimeters. On the fifth day after admission the patient began

to vomit, moist rales were detected in the bases of both lungs and the temperature was elevated. The leukocyte count rose to 17,780. A roentgenogram showed consolidation in the base of the right lung. The patient lived four days after a diagnosis of pneumonia in the base of the right lung had been made. During these four days 720 grams (48 Gm) of sulfathiazol

Fig 11 (case 3)—Bone marrow from femur showing nests of polymorphonuclear cells and necrosis,  $\times 100$

was given in 5 per cent solution intravenously at the rate of 60 grains (4 Gm) every eight hours. The temperature ran from 99 to 101 F, and the highest level of sulfathiazole in the blood was 101 mg per hundred cubic centimeters. The fluid intake was 3,500 cc a day, and the urinary output averaged 1,575 cc a day. No further clinical data concerning the patient's last four days were available.

**Autopsy** (Dr. Arnold Rich)—Anatomic Diagnosis. The provisional anatomic diagnosis was carcinoma of the head of the pancreas and obstruction of the duodenum, common bile duct and pancreatic ducts, metastases to the liver and mesenteric, aortic and hepatic lymph nodes, jaundice, ascites, hydrothorax on the left, hydropericardium, edema of the extremities, hypertrophy of the stomach wall, severe generalized and moderate coronary arteriosclerosis, emphysema, dense pleural adhesions on the right, a calcified hilar lymph node in the right lung, hydrocele, bilateral aspiration pneumonia, lower lobe, left lung, and emaciation.

**Microscopic Examination** A description of the pathologic lesions would be a repetition of that in case 1. The provisional anatomic diagnosis was not changed, and areas of focal necrosis infiltrated with polymorphonuclear cells were encountered in the kidneys, spleen, liver, bone marrow, lymph nodes and lungs.

**CASE 4**—A Negro boy aged 8 months was admitted to the Sydenham Hospital Feb 26, 1941 with a clinical picture of whooping cough. The temperature was 101 F, the pulse rate 140, the respiratory rate 30 and the weight 10 lb (4.5 Kg). The child was emaciated. The skin was dry and wrinkled. The skeletal examination was negative. Crackling rales were heard in the bases of both lungs. Only or only. Roentgen examination confirmed the diagnosis of lobar pneumonia. A blood culture was negative. The sedimentation rate showed 60,000 white cells, with 70 per cent small lymphocytes. Beta hemolytic streptococci were obtained from the

Fifteen grams of sulfathiazole was given on admission and then 2 grams (0.1 Gm) every three hours for thirteen doses. In other words 40 grams (27 Gm) of sulfathiazole was given by mouth over a period of thirty-six hours. The highest level of sulfathiazole in the blood obtained was 4 mg per hundred cubic centimeters. The highest temperature reading was 102 F. There was a variation in the results of studies of the blood. The patient died in a paroxysm of coughing.

*Autopsy* (Dr Arnold Rich)—*Gross Examination* Nothing important was observed except enlarged mediastinal glands, scattered patches of pneumonia and effusion into all the serous cavities.

*Microscopic Examination* Areas of solitary focal necrosis infiltrated with polymorphonuclear cells were encountered in the liver, lungs, spleen and kidneys. As in the other 3 cases, there was no zone of hyperemia surrounding the lesions.

#### SUMMARY

We feel that it would be worth while to summarize these cases with regard to the difference in the type of disease, dose of sulfathiazole, level of sulfathiazole in the blood, occurrence of drug fever and drug rash, tenderness in the costovertebral angle and change in blood chemistry. Our first patient was a 32 year old white woman in the postpartum period with a history of preeclampsia and with an *Esch coli* urinary infection who was given a first course of sulfathiazole consisting of 150 grams (10 Gm) administered during a period of twenty-four hours. After an interval of five days she was given 165 grams (11 Gm) of sulfathiazole within thirty-six hours. After a forty-eight hour interval she

Fig. 12 (case 1)—Thrombus in renal vein containing pools of polymorphonuclear cells.  $\times 100$

was given 90 grams during a period of twenty-four hours. The administration of sulfathiazole was stopped because of a high fever, a cutaneous rash, pain and tenderness in the right costovertebral angle, a respiratory rate of 45, a nonprotein nitrogen content of 83.1 mg per hundred cubic centimeters and a carbon dioxide combining power of 37 volumes per cent. Twelve hours later the patient had a sudden onset of paleness, thready

pulse, extreme drop in blood pressure and unconsciousness. Death occurred about one-half hour afterward.

The second patient was a 73 year old Negro woman with pyelitis associated with a stag horn calculus who was given 645 grams (39 Gm) of sulfathiazole in continuous doses during a period of nine days. Use of the

Fig. 13 (case 1)—Meningeal vessels containing an organizing embolic thrombus presenting necrotic areas and nests of polymorphonuclear cells.  $\times 100$

drug was stopped owing to an unexplained elevation of the temperature to 103 F. The patient died two days later. A temperature of 103 to 105 F had persisted during the two days prior to death. The patient was in deep coma for thirty-six hours before death. Further clinical details are not known. The third patient was a 73 year old jaundiced Negro man with carcinoma of the head of the pancreas complicated by aspiration pneumonia who received 720 grams (48 Gm) of sulfathiazole in continuous doses (60 grams [4 Gm] each eight hours intravenously) over a period of four days after which he died. Coma preceded death by about twenty-four hours. There was no added rise in temperature during the period of drug administration. At no time was any cutaneous rash noted.

The fourth patient was an 8 month old Negro boy with pertussis pneumonia who received 40 grams (26 Gm) of sulfathiazole during a period of thirty-six hours. He died during a paroxysm of coughing. There was no additional rise in temperature during the time of drug administration, and no cutaneous rash was noted.

The concentration of sulfathiazole in the blood did not exceed 10 mg per hundred cubic centimeters in any of these cases. The fluid intake and the urine output were known to be adequate in cases 1, 3 and 4. All blood cultures were negative.

*Pathologic Changes*—The pathologic lesions were invariably microscopic in type, grossly they were obscured by the edema and cloudy swelling. The lungs and kidneys were involved in all 4 cases. The spleen, lymph nodes and liver were involved in 2 cases. Bone marrow was obtained in only 2, typical pathologic lesions were encountered in both specimens. The characteristic lesions, as illustrated by the photomicrographs, were discrete and composed of coagulum which might or might not be infiltrated with polymorphonuclear cells. There were no zones of hyperemia surrounding these areas. Bacterial stains revealed no organisms. The lesions were similar to those seen in mice killed by excessive sulfathiazole in the diet.

ossificans traumatica Butler and Wooley<sup>14</sup> reported that a woman aged 68 had a calcified hematoma of the buttock in which a sarcoma developed To these we wish to add 2 cases in which osteogenic sarcoma devel-

Fig 5 (case 3)—Appearance of feet showing deformity similar to that seen in the hands Roentgenograms revealed the most noticeable deformity to be present in the first metatarsals

oped in preexisting myositis ossificans circumscripta and a third case in which myositis ossificans progressiva was associated with a sarcoma developing in the muscles of the back

Fig 6 (case 3)—Calcified plaques found in the posterior cervical muscles

CASE 1—History—A white man aged 36, a salesman, admitted to the Memorial Hospital Aug 3, 1936, complained of a tumor in the right thigh The familial and past histories were negative

In 1920 while running a cross country race, he injured the muscles of the upper part of his right thigh Following the injury (the so-called charley horse), a firm, painless mass developed in the muscles of the upper medial part of the thigh and remained inactive for sixteen years Two months before admission the upper portion of the mass became larger and was aspirated by his family physician Approximately 4 ounces (120 cc) of serosanguineous fluid was obtained Roentgenograms were made revealing a large, irregular, pedunculated calcareous mass in the soft tissues of the medial aspect of the thigh, apparently attached but not a part of the femur The cortex of the femur was not invaded Three weeks before admission an attempt was made to remove the mass The tumor capsule was ruptured in removal The wound was swabbed with acetone The postoperative course was uneventful The patient was referred to the Memorial Hospital for further treatment

Physical Examination—The patient was well developed and in fairly good general condition The physical findings were

Fig 7 (case 3)—In this view of the lumbar muscles note the plates of ossified tissue just to the left of the midline and extending from the eleventh dorsal to the fifth lumbar vertebra

essentially negative except for the local lesion Over the inner aspect of the right thigh there was a recently healed wound 13 cm long beneath which was an indefinitely large area of thickening of the soft part extending from the inguinal ligament downward about 20 cm A roentgenogram of the thigh was negative for pulmonary metastasis The tumor was diagnosed on microscopic study as spindle cell osteosarcoma

Treatment—Between August 4 and September 2 the patient was treated with the 4 Gm radium element pick 120000 gram hours being given at a 15 cm radium skin distance On September 17 interstitial radon was inserted in the tumor of 53 millicuries destroyed Between November 9 and December 30 he was given twenty sessions of high voltage therapy, 200 roentgens each, through a circular field 10 cm in diameter (factors, 200 kilovolts, 0.5 mm copper filter, target skin distance) On Feb 3, 1937 roentgenogram of the chest showed pulmonary metastases The patient became progressively worse and died in July, thirteen months after the clinical onset of his disease

**CASE 2—History**—A white man aged 27, admitted to the Memorial Hospital Dec 23, 1935, complained of a recurrent tumor of the right thigh. The familial and past histories were negative.

In February 1934 a tumor mass measuring 2 cm in diameter was removed from the right thigh in another institution. A microscopic examination of the specimen was not made. In September a local recurrence of the tumor was noted. This was surgically excised at the same institution, followed by a course of high voltage roentgen therapy (factors unknown) and one course of Coley's toxins. In August 1935 a second recurrence was noted in the original scar and the patient received additional high voltage roentgen therapy before he was referred to the Memorial Hospital.

**Physical Examination**—The patient was well developed and well nourished. The head, neck, chest and abdomen were essentially normal. On the anterior surface of the right thigh, over the trigone, was a healed scar in the midportion of which was a firm nodular circumscribed tumor measuring 2 by 2.5 cm. A second scar and nodular mass measuring 4 cm in diameter was found on the posterior medial surface of the thigh below the apex of the adductor canal. The skin showed evidence of recent irradiation. A roentgenogram of the chest showed a spherical opacity in the center of the right lower lobe typical of metastasis. Examination of the femur and pelvis was negative for bone involvement. The pathologic report on submitted slides from the specimen removed in September 1934 was osteogenic sarcoma, presumably beginning in either a hematoma or myositis ossificans.

**Treatment**—The patient was given twelve treatments of 200 roentgens each through a 7 cm circular port over the tumor in the thigh (factors, 200 kilovolts, 0.5 mm copper filter, 63 cm target-skin distance). The pulmonary metastases were treated palliatively by roentgen rays and the radium element pack. The patient died from cerebral metastases on Dec 23, 1936. Permission for autopsy was not obtained.

**CASE 3—History**—A boy aged 7 years was admitted to the Memorial Hospital complaining of a tumor mass involving the right shoulder. The familial history was irrelevant. The past history revealed that a right inguinal hernia had been repaired in infancy.

Six weeks prior to admission, a tumor was noted over the right scapula. It gradually increased in size. Nodules were removed for biopsy and the patient was referred to the Memorial Hospital for further treatment.

**Physical Examination**—The patient was undernourished. The head was normal except for large tonsils. The neck showed slight limitation of motion. The lungs and heart were normal. The abdomen showed a well healed right inguinal scar. There was microdactylia of both hands and feet, especially noticeable in the thumbs, fifth fingers and first toes.

**Muscular System** In the left posterior cervical region a pencil-like calcification was palpated. Two flat calcified plaques were noted in the spinous muscles, just to the left of the midline in the lower thoracic and upper lumbar regions. These plaques of bone were freely movable in the prone position but became fixed with muscle contraction.

**Local Lesion** A symmetrical, firm tumor was noted overlying the right scapula. It extended medially between the scapula and the spine as an ill defined diffuse tumefaction infiltrating the right trapezius and rhomboid muscles. It also extended upward to the suprascapular fossa, over which was a small scar of a previous biopsy. The entire scapula seemed to be pushed outward by the tumor mass.

Roentgenograms of the chest and shoulder showed no evidence of pulmonary metastasis or bone involvement. Irregular calcified plaques were noted along the right axillary line and the left cervical region above the crest of the right scapula along the upper portion of the humerus and in the paralumbar region on the left side. Additional skeletal roentgenograms showed an exostosis of the medial portion of the head of the right tibia and probably small osteomas with broad bases in the medial and upper portions of both tibial shafts. There was anomalous epiphyseal development of the bases of the second

and fifth metacarpals, and the digits showed bilateral microdactylia. Both feet showed a similar deformity of the first digits.

**Treatment**—On Aug 2 1940 a formal biopsy of the tumor was obtained under anesthesia induced by avertin with amylene hydrate. This was reported as a malignant tumor, probably a myxoliposarcoma. Postoperative irradiation was given through two ports 17 by 7 and 15 by 6 cm, a total dose of 3 000 roentgens being given twice (factors, 250 kilovolts, 1.5 mm copper filter, 50 cm target-skin distance). In October a second course of irradiation totaling 2 800 roentgens was given. On November 7 two enlarged lymph nodes were noted in the left side of the neck. The upper node received 400 roentgens five times through a port measuring 8 by 4 cm (factors, 250 kilovolts, 0.5 mm copper filter, 35 cm target-skin distance). The lower node received 400 roentgens five times through a port measuring 8 by 4 cm (factors, 250 kilovolts, 1.5 mm copper filter, 50 cm target-skin distance). Complete regression of the tumor and the enlarged lymph nodes followed.

He was readmitted March 18, 1941 for the purpose of having a section of the myositis ossificans removed for microscopic study and determination of whether there was any disturbance in his calcium-phosphorus metabolism. On March 28 he was given 0.4 millicurie of radioactive phosphorus ( $P^{32}$ ) and the following day was placed on a known calcium and phosphorus intake. One week later a section of the myositis ossificans in the lumbar region was surgically removed. It grossly simulated fairly normal bone. There was a definite periosteum covering the external surface, a well organized cortical portion and what appeared to be a marrow cavity. Microscopically it resembled dead bone in tendon or aponeurosis.

During the preoperative control period all urine and fecal excretions were carefully assayed by Dr Helen Q Woodard, who reported: 'From March 29 1941 to April 14, 1941 this child took a diet containing approximately 1 Gm of calcium and 1.3 to 1.6 Gm of phosphorus daily. He was in strongly positive calcium and phosphorus balance, excreting an average of 194 mg of calcium and 370 mg of phosphorus daily. The partition of calcium and phosphorus between the urine and the feces showed no gross abnormalities, though the urinary calcium was low. The findings appear to be consistent with the picture of a previously poorly nourished child recently put on a liberal diet, rather than of a child with a generalized abnormality in calcium-phosphorus metabolism.'

'In the mineralized specimen removed on April 5 1941 the phosphatase was of bone type and the activity was greater than that in any normal growing bone that I have examined. The radiophosphorus uptake was also high. Adjacent uninvolved muscle was normal in phosphatase and radioactive phosphorus. The findings indicate that the pathologic mineralization is due to local changes in the affected areas.'

#### SUMMARY

In a brief review of the literature on myositis ossificans reports of 5 cases were found in which the bony tissue of myositis ossificans underwent malignant neoplastic change, i. e., osteogenic sarcoma developed. Our first 2 cases showed this development. In our third case myositis ossificans progressiva was associated with a malignant tumor probably myxoliposarcoma.

York Avenue at Sixth-Eighth Street

**Food Allergy**—The principal cause of food allergy in the United States is wheat. Eggs are second. The third offender is milk. Clearly the agriculturists have a stake in the subject of allergy and in 1936 the U. S. Department of Agriculture established a research laboratory in this field under the direction of Dr Henry Stevens, a chemist. He is interested from the chemical point of view and also through the collaboration of a medical man from the clinical point of view, inasmuch as the effect of agricultural allergens on human beings is after all the supreme consideration.—Gray, George W. *The Advancing Front of Medicine*. New York: McGraw-Hill Book Company, Inc. 1941.

## CONSTITUTIONAL INADEQUACY

WALTER C. ALVAREZ, M.D.

ROCHESTER, MINN.

The main trouble with many of the patients I see every day is that they are always weak and tired and full of pains and always getting sick in one way or another. Many have been operated on several times, but still they aren't well and they cannot get about and have fun as other people do. Some of the men cannot earn a living, and many of the women complain that they haven't strength and "pep" enough to be a satisfactory wife or mother. They drag around, they cannot do their housework, and they haven't the energy to go out anywhere with their husband.

THE HOPE OF FINDING ONE CAUSE  
FOR THE TROUBLE

Again and again these patients go to some consultant or medical institution with the idea that this time they will get examined so thoroughly that the cause of all their troubles will be found and perhaps removed. Again and again they get overhauled, and each time the physician finds some little abnormality or physical peculiarity which he views with alarm and treats for a while.

Commonest among the diagnoses made nowadays in the hope of explaining the sufferings of these people are colitis, spastic colon, ptosis, pelvic disease, adhesions, chronic appendicitis, glandular dysfunction, low blood pressure, mild Addison's disease, low blood calcium, brucellosis and chronic nervous exhaustion. That in a given case the diagnoses made in the past were wrong and the local abnormalities found were not sufficient to explain the illness can be seen from one fact alone, and this is that the extensive treatments carried out and the operations performed in an effort to correct the supposed diseases did not put an end to the symptoms.

## THESE PATIENTS ARE GETTING A RAW DEAL

Actually, as I listen daily to the stories these patients tell of their many medical adventures, I gain the disquieting impression that we physicians, in our desperate efforts to find some one bit of diseased tissue on which to place the blame for all their symptoms, are only grasping at straws. Again and again we pounce hopefully on some slight bodily peculiarity and try to correct it, only to realize after a fruitless operation or months of ineffectual treatment that we were on the wrong track. With the best of intentions we are giving these people a raw deal—doing too many things to them and wasting their money.

## HOW TO IMPROVE THE SITUATION

The question then is: How can matters be improved? It seems to me that, to begin with, we physicians must recognize more often and more promptly the constitutional frailness or sickness of these patients and the inherent incurability of their disease. We must stop looking hopefully for some one lesion to explain the disability, the psychoneurosis and the aches and pains everywhere, and we must not let ourselves be led astray by those little variants from normal that we can usually turn up during an examination. And when we do recognize the functional nature of the syndrome we must not rest satisfied with the diagnosis of chronic

nervous exhaustion, as so many of us are now inclined to do, but must go on to apply a label—constitutional inadequacy—which will keep reminding us that we are dealing with an inborn and essentially ineradicable disease.

## HOW TO RECOGNIZE THE PATIENT

The next question is: How are we to recognize these patients? Well, often it is easy. In many cases the nature of the disease can be recognized from a glance at the lengthy request for an appointment that came in the mail, written on two sides of cheap ruled paper. The long rambling tale of woe, with the evident longing for escape from a life of chronic invalidism and frustration into one of good health and happiness, gives a good idea of what is wrong.

Or when the patient walks into the office the diagnosis will be apparent. There, perhaps, will be a frail looking or scrawny woman, whose tissues were evidently made up out of poor materials. Perhaps the hand of the potter slipped a bit so that the body is poorly proportioned and poorly put together. Perhaps it looks as if, during the early years of development, the pituitary gland and the ovaries, which preside over sexual development, failed to do their job properly.

The curse of inadequacy will become even more apparent as soon as the long story is told of many illnesses, many diagnoses, much fatigue, much disability and much strenuous but futile treatment. Surely the minute the physician gets this history he should realize that he isn't going to work any spectacular cure, and he isn't going to make the patient over into a "husky," no matter how many localized diseases he succeeds in finding and removing.

It is more difficult to diagnose inadequacy when the patient is a big, well muscled man or a fine looking woman. Then the physician will have to depend on the characteristic history of repeated illnesses, many complaints and long continued and surprisingly severe disablement after every little infection, accident or operation. As a frail inadequate type of woman once said to me, "Dad may look big and strong, but let him get a pimple on his nose and he'll be laid up for two weeks, just as I would be."

Another way of recognizing the inadequate woman is to watch her as she goes through her tests, a little pain, a little diarrhea, a sleepless night, or some bad news from home, and she will be prostrated and confined to bed for a day or two.

As I have already said, the physical examination may or may not strengthen the impression that the patient is constitutionally inadequate. In a woman the uterus may be found to be infantile in type, the breasts may be poorly developed and nodular, the body hair may have a masculine distribution, the thoracic cage may be unusually long, with a narrow epigastric angle, and the pelvis may be flat and simian in type, but then again none of these physical peculiarities may be present.

SEVERAL TYPES OF THE CONSTITUTIONALLY  
INADEQUATE

There are several types of this disease. One of the simplest is to be found perhaps in the asthenic type, whose outstanding complaint is that he cannot do much work or excitement or loss of rest. Darwin is a beautiful example of an asthenic. For forty years he never could work more than three hours a day, and he couldn't stand the least excitement or departure from the day's routine. A trip to London, a few months

a public gathering or even a quiet evening with friends and he would be knocked out, unable to sleep and shivering and vomiting for several days. The asthenic does not have to be at all psychopathic or inclined to complain; he just cannot stand overwork or strain.

In many inadequate women the main trouble seems to be in the pelvic organs or those glands of internal secretion which regulate menstruation. The woman may have either an infantile or a monotonous uterus, perhaps cystic ovaries and chronic mastitis. She may menstruate with difficulty and she may be sterile. She may be frigid sexually and she may end up before she is 40 with a hysterectomy.

In another type of inadequacy there is poor resistance to infections of all kinds and poor ability to recover from them. In yet another type there is a tendency to aching and soreness in many parts of the body. There will be backaches, headaches and arthritic, myositic, fibrositic and neuritic pains all over the body. A certain number of badly migranous persons are constitutionally inadequate. Curious are the inadequate who become senile early in life. One finds them selling magazines and pop on trains or working as messenger "boys."

The inadequate with a neurocirculatory type of asthenia are likely to have hypertension with an irritable heart and a tendency to cardiac neurosis. They often have cold clammy hands, cyanotic legs and feet, a little albumin in the urine, dizziness on changing position, and a tendency to fainting.

Common is the type of inadequacy in which the patient complains principally of digestive troubles and in whom the symptoms are mainly those of an irritable colon, indigestion, perhaps a sore liver, poor appetite, and difficulty in eating enough to maintain normal weight. Some of the inadequate have what I call a small intestinal laboratory which allows them to digest only small amounts of food at a time. Some of them perhaps have too short a small bowel for adequate absorption. Dr. William J. Mayo used to say that at operation on these persons he often noted a flabby gastrointestinal muscle.

Still more common is the type of inadequacy in whom the symptoms are predominantly those of nervousness, worrisomeness, hypersensitiveness, and a great fear of illness and death which keeps the victim running to doctors all the time. Often he goes not so much because he is ill as because he fears his discomforts are going to turn into something serious. He may go also because he cannot stand much discomfort or pain, he cannot "take it" as many normal people do, and, because of this and his fears, his behavior in the physician's office or the hospital is often peculiar and easily recognizable. It is so characteristic that when I find it in a man or a woman with a finely built body I suspect that I am dealing with an inadequate, and usually my later experience with that patient shows that I was right.

Interestingly, when this peculiar psychopathic makeup is lacking in a frailty built person and he has sufficient energy, fortitude, "guts" and "ability to take it," he never becomes an inadequate, or certainly never behaves like one. As Robert Louis Stevenson remarked after a lifetime of achievement, gained in spite of daily suffering with tuberculosis, a man has good health if he can only do without it uncomplainingly. On the other hand, many a neurotic or psychopathic person is not inadequate and never feels physically ill. Apparently it is only a certain type of neurosis or psychosis that goes with or produces constitutional inadequacy.

#### IS THERE A NEED FOR A SEPARATE LABEL OF CONSTITUTIONAL INADEQUACY?

Some physicians will probably feel like interrupting me at this point to ask if it is true that most of these persons are neurotic or psychopathic, why shouldn't we classify them as such and let it go at that, why bother to give them an extra label? My answer is that often I feel the need for an extra label to tell something important about a patient which other labels used alone will not tell. I find it useful to pick out of the groups of the frail looking, the husky looking, the neurotic and the psychopathic those particular persons who do not stand up well to the strains of life and cannot be made over into strong useful persons, no matter how many localized diseases are found and eradicated.

I feel the need for an extra label also when dealing with those thousands of chronically ailing persons whose symptoms seem to be due partly to a frail body and partly to a poorly functioning brain. For them I like an omnibus term like constitutional inadequacy. Incidentally, some physicians may ask: Why not use the term constitutional or biologic inferiority? and my answer is that this term is likely to be offensive to the patient. Many a person who might object to being called inferior will admit freely that he is inadequate to stand up well to the stresses of life. If I see that a patient is a bit cast down over this idea, I try to cheer him by pointing out my own woful inadequacy to earn a living as a prize fighter. Thus I get him to see that not all of us in this world can be strong enough for every type of work, and some must take the easier jobs.

Certain it is that to recognize early the presence of constitutional inadequacy is to save a patient much futile treatment and perhaps several largely useless operations. For instance, let us consider the problem of a young woman with menstrual pain so severe that she has to keep to her bed for a day or two out of every month. If she is otherwise healthy and strong, a surgeon can go ahead and resect the presacral plexus with much hope of working a cure, but, if after talking to her awhile he concludes that she is an inadequate person, he may well refuse to operate because he will then have little hope of making her over into a strong, healthy woman.

It is helpful also in many cases to apply a label which will show the essential unity of what, at first glance appeared to be a group or a series of unrelated diseases. For instance, let us turn to the record of a frail school-teacher who, years ago, broke down and became tired out and full of misery. At a university clinic to which she went, the gynecologist blamed dysmenorrhea for her troubles, the endocrinologist blamed a pituitary-ovarian dysfunction, the neurologist blamed a severe migraine, the psychiatrist blamed overwork and a poor adjustment to celibacy, the orthopedist blamed a twisted spine, the gastroenterologist blamed a "colitis" and the surgeon blamed the appendix.

Who was right? Well, let us see. During the years that followed, resection of the presacral plexus stopped the menstrual pain, the headaches were relieved by ergotamine tartrate (gynergen), the giving up of the job removed the main cause of fatigue, marriage put a stop to many psychic conflicts, physical therapy helped the back, diet and enemas kept the colon fairly comfortable, and the appendix was removed. But the woman didn't get well! She went on being tired and full of misery, and then gradually it dawned on every one who was taking care of her that, from the beginning, all her troubles had been but manifestations of a constitutional

inadequacy Now, if this basic defect had only been recognized at the start, as I think it could have been, the woman and her husband could have understood better what they were up against, and if in those early years they had acquiesced to the situation they could have saved the thousands of hard earned dollars they spent on several wild goose chases after health.

Another time when I feel the need for an extra label is when I see a patient who has some organic disease, such as duodenal ulcer, but who owes practically all his discomfort and disability to constitutional inadequacy. In such cases I like to recognize the inadequacy early before I waste much time on treatments which, even if they should heal the ulcer, cannot put the patient back to work.

#### COMMON COMPLAINTS OF PATIENTS WITH CONSTITUTIONAL INADEQUACY

Now, what are the common symptoms of inadequacy? As the reader will already have gathered, the symptoms are many. Perhaps the commonest are those of excessive fatigue and a lack of energy and reserve strength. Other common complaints are aches and pains everywhere, nervousness, faintness, dizziness, indigestion, poor appetite, loss of weight, regurgitation, a sensitive colon, constipation, palpitation, clammy hands, cardiac neuroses, defective or painful menstruation, dyspareunia, sterility, poor resistance to infection, slow recovery from any illness or injury, insomnia, "chronic fever," "weak eyes" and an irritable bladder.

#### THE DIAGNOSIS

Inadequacy must always be suspected whenever it is noted, first, that nervous prostration, disabilities of various kinds and feelings of great fatigue have been present for years without bringing disaster. Sometimes the patient will even end up in the fifties looking fat and healthy. Second, that the severity of the symptoms is out of all proportion to whatever slight deviations from normal can be found on a thorough overhauling. The essential point which can and should often be made to a patient is that even if she had the gallstones her home physician feared she had, she wouldn't be anywhere near so ill and prostrated as she is. Third, that the aches and pains are scattered too widely over the body to be explained on the basis of any one lesion. If the woman had the disease in the appendix that she thinks she has, this might account for her indigestion and part of her abdominal distress, but it couldn't account for the rest of her many symptoms. Often I tell a highly nervous woman what I think is a fact, and that is that there is no disease of the abdominal organs which can produce a psychoneurosis. That must arise in the brain.

The diagnosis of inadequacy with hypersensitiveness and neurosis is often made or strengthened as the physician watches the way in which a woman behaves in the office as she submits to the several examinations. She may lie around apathetically, as if too tired to sit up, she may go around in a wheel chair which she could easily do without, she may complain bitterly about procedures which do not bother most patients, she may be prostrated by every little discomfort, and she may be hard to handle.

And when the physician starts treating her, again he is likely to get information of much diagnostic value. At the hospital she may be upset by small discomforts and annoyances, and everything that is done for her may make her worse. Drugs will have unexpected, abnormal and disturbing effects, sedatives will work like

excitants, and a soft diet may cause her more distress than she had on a full diet. In spite of a high caloric intake she may lose weight.

#### THE CAUSE OF THE TROUBLE

Whatever the cause of this protean syndrome is, I am sure it is not to be found in any disease in any one organ, unless it is the brain. Actually, in most cases I feel sure the primary constitutional weakness is in the nervous system. I feel sure of this because (1) I have found constitutional inadequacy sometimes in finely built men and women, and (2) I have found it so often in the relatives of the insane. I believe the severe forms of constitutional inadequacy are commonly equivalent of insanity. Interestingly, it has been shown that most of the soldiers with "disordered action of the heart," who so often end up as inadequate veterans, have near relatives who are insane.

In some cases poor materials seem to have gone into almost every organ of the body. Certainly there must be a tremendous difference between the original physical endowment of one of these frail, always ailing persons and that of a man who, after eighty years of good health, still has his hair, his teeth, his eyesight and plenty of energy.

Although the symptoms of inadequacy may not show up until a woman is over 20, the defective tissues must have been there from birth. Naturally, like the walls of a defective tire they are likely to hold well for some time before they blow out. Some persons with an inheritance that predisposes to inadequacy can remain well for years if they can only be spared adversity, overwork, infections, accidents and operations. It is doubtful that typical inadequacy can ever be produced by suffering and disease if good materials went originally into the construction of the person's body. Certain it is that many persons with a good nervous inheritance will stand years of suffering without showing signs of inadequacy. I remember a merry, dynamic, able woman who kept on running a business for years after she was almost ossified by a painful form of arthritis.

The main defect in the inadequate person seems often to be a lack of that something in the brain that keeps most persons feeling well and unconcerned about health. Perhaps it is this same something that keeps most of us hopeful when we are ill or enables us to accept discomforts and disasters and to carry on cheerfully in spite of them.

I feel sure that many inadequate persons are tired most of the time because they use their brains unwisely and waste so much energy on foolish thinking, silly worrying, conscience searching, jealousies, flare up of temper, conflicts with people, and riots of emotion. We healthy persons would be tired out too if we were to use our brains so uneconomically.

#### THE HEREDITY OF THE DISEASE

As I have already said, constitutional inadequacy is inherited from forebears who suffered either from inadequacy, frailness of body, poor pituitary development, or some form of psychopathy. Here, let us say, is Jones, who all his life is going to suffer from fatigue and lack of energy that he will be unable to earn a living. My impression is that if he had been at his conception all the bad genes that Grandfather Jones had to hand on he would have ended up in an insane asylum with melancholia just as she did. Seeing that the bad genes derived from her were offset by fairly good ones from three other grandparents, Bill got was a bad case of that tired feeling.

of insanity commonly heard of as one takes the history of the patients with severe forms of constitutional inadequacy are shuttleness, eccentricity, vagabondism, solitariness, dipsomania, suicide, stammering, enuresis, pathologic temper and treble-mindedness.

Often I have been impressed by the fact that in certain families constitutional inadequacy, psychopathy or neurosis and abnormalities in the functions of the glands of internal secretion seem to be inherited sometimes together and sometimes sorted out. From this I gain the impression that the genes for these defects are sometimes linked and sometimes separated.

#### TREATMENT

As already pointed out we physicians must become more conscious of the importance of this problem of constitutional inadequacy and we must become more adept at recognizing the victims when they first begin to break down. We must spot them soon after they come into the office. After recognizing them we must spend much time with them trying to get them to understand the situation to acquiesce to it and to stop hunting for a complete cure. When they will permit us to use our judgment as to the tests worth making and the treatments worth trying, we can save them from the wastage of much money.

We must learn the technic of explaining the situation to them so that they will accept our verdict without annoyance or rebellion and will decide to mend their bad psychic ways, to hoard their energies and to live within their limited means of strength. Oftentimes we can make these persons self supporting or at least less of a burden to their relatives than they were before, by encouraging them to find work that they can do without breaking themselves down. Often we can give them hope and encouragement by telling them what is true and that is that some of the best work of the world has been done by frail persons who suffered from poor health all their days. I often point to Darwin, who, by working only a few hours a day, published a long series of papers and books and changed the thought of the world.

Sometimes the constitutionally inadequate man greatly needs the physician's help in getting his family or more important yet, his wife's family, to understand the situation so that they will stop blaming him for his failures to work steadily and to succeed well in life. Women often need similar help so that the husband will understand the situation and will be more sympathetic and helpful.

#### SUMMARY

Many of the chronically ailing patients seen daily by medical consultants are constitutionally inadequate persons, unable to stand up well to the strains of life. They cannot be cured, as they hope to be, by the discovery and eradication of any one local disease.

By grasping desperately at diagnostic straws, by carrying out extensive treatments and performing operations on these persons, we physicians, with the best of intentions, often do them injury, and waste their money and our time.

We must learn to recognize these persons and their symptoms more often and more quickly so as to save them expense and trouble. In many cases the basic weakness is in the nervous system. In bad cases the disease seems to be an equivalent of insanity. In other cases it goes with an inheritance of a frail body and defective glands of internal secretion.

Treatment must consist mainly of keeping the patients from doing foolish things and wasting money. They

must be taught if possible to acquiesce to the situation to stop hunting for a complete cure to hoard their energies and to find a job that can be done without too much fatigue.

In times of war every effort must be made to keep the constitutionally inadequate out of the army. All they do is to break down and go on the pension roll.

## STUDIES ON THE CONTROL OF ACUTE RESPIRATORY INFECTIONS

### I. PRELIMINARY REPORT ON THE ORAL ADMINISTRATION OF SULFADIAZINE AT THE ONSET OF ACUTE RESPIRATORY ILLNESSES

MORRIS SIEGEL, M.D.

NEW YORK

The successful treatment of pneumococcic streptococcic and other bacterial infections of the respiratory tract with sulfonamides has led to a consideration of their use in the prevention of these infections and their complications. For this purpose sulfadiazine<sup>1</sup> was chosen because of the early reports on its relatively low clinical toxicity and its high therapeutic effectiveness<sup>2</sup> against different bacterial pathogens of the respiratory tract. This preliminary report deals with the clinical conditions found in patients treated at the onset of symptoms of acute respiratory infections as compared with those who were not treated with sulfadiazine.

#### PLAN OF STUDY

The study has been conducted at Letchworth Village, a New York state institution for mental defectives. It was carried out among the group of children

From the Public Health Research Institute of the City of New York. The sulfadiazine was supplied by Lederle Laboratories, Inc., Pearl River, N. Y.

Aided by a grant from the Metropolitan Life Insurance Company on the recommendation of the Influenza Pneumonia Commission.

The physicians at Letchworth Village, particularly Dr. Harry C. Storrs, superintendent, Dr. Herman Alpert and Dr. Nathaniel Bernstein aided in this work.

with the lowest mental rating who were highly susceptible to respiratory infections and who usually had an annual pneumonia incidence of more than 10 per cent. These children were confined to two cottages, the boys to cottage Iota and the girls to cottage Y. Each cottage had about 130 inmates varying in age from 2 to 14 years, the average being about 8 years.

In cottage Iota the inmates were allocated to a sulfadiazine treated and a control group in alternate order of admission to the institution. The average number in each group throughout the test period was about 65. The groups were comparable in respect to physical and mental characteristics, age, weight, duration of residence at the institution and incidence of endemic respiratory infections and pneumonia.

In cottage Y definitive test groups were not chosen for the duration of the study. Instead, alternate patients with acute respiratory illnesses were treated with sulfadiazine.

The sick children in each cottage were put to bed in their respective dormitories as soon as any symptoms of infection were recognized. They received the routine type of treatment employed in the cottage. This consisted of bed rest, enemas, fluids, acetylsalicylic acid and local applications as needed. In addition, the group treated with sulfadiazine received the drug from the time of onset of recognizable symptoms of respiratory illness.

Patients requiring hospital care were transferred to the hospital maintained at the institution. Here the type of treatment depended on the nature and severity of the illness and not on the test group to which the patient had been assigned in the cottage.

The dosage of sulfadiazine employed in this study varied with the weight of the affected child and the temperature. For children weighing less than 50 pounds (23 Kg) and having a rectal temperature of less than 102 F at the onset, the initial dose was 1 tablet of 0.5 Gm, followed by two doses each of 0.5 Gm at four hour intervals. After the first day, 1 tablet of 0.5 Gm was given three times a day at 8 a. m., noon and 4 p. m. For children weighing more than 50 pounds or for those having a temperature of 102 F or more at the onset, the initial dose was 1 Gm, followed by three doses each of 0.5 Gm at four hour intervals. Then daily maintenance dose was 4 tablets (2 Gm) given in four doses between 8 a. m. and 8 p. m. The drug was given for at least three or four days or until the rectal temperature had been less than 100 F for twenty-four hours.

#### RESULTS

The test period in cottage Iota began on Dec 14, 1941, and from this date to Jan 17, 1942 79 patients with colds were observed, 8 the first week, 7 the second, 10 the third, 35 the fourth and 19 the fifth.

There were 39 in the sulfadiazine treated group and 40 in the control group.

The number of clinical infections was equally distributed between the test groups. The frequency and severity of the acute respiratory illnesses increased after December 28 and reached epidemic proportions between January 4 and January 17, when about 40 per cent of each group was affected. During this period the predominant symptoms were coryza and cough. Many of the infections of the upper respiratory tract were severe and were associated with a high incidence of acute bronchitis and pneumonia.

Hospitalization was required by 12 (30 per cent) of the control group and 2 (5 per cent) of the sulfadiazine treated group. In 1 case of the treated group the temperature was 105.6 F on the first day of illness when pneumonia was suspected, 99 F on the second day and 103 F on the third day, when a definite diagnosis of pneumococcus type XVIII A (Dougherty)<sup>3</sup> lobar pneumonia was made. In the other case the temperature was 106 F when the illness was first recognized, and the patient was at once transferred to the hospital after having received an initial dose of 1 Gm of sulfadiazine.

Of the 12 control patients who were hospitalized, 6 had pneumonia. Type I pneumococcus pneumonia occurred in 4 of these cases. 2 were recognized within twenty-four hours after the first signs of illness were observed, the third within seventy-two hours after the onset and the fourth case after nineteen days of intermittent fever, nasal discharge and cough. In the remaining 2 cases of pneumonia, signs of consolidation were recognized two and six days, respectively, after the first symptoms of illness were noticed. The latter patient died shortly after admission to the hospital. Of the remaining 6 hospitalized control patients, 3 had acute bronchitis and 3 nasopharyngitis.

Hospitalization was not required in 37 (95 per cent) of the sulfadiazine treated group and 28 (70 per cent) of the control group. A fall in temperature after the first day's treatment with sulfadiazine occurred in 35 (90 per cent) cases, while in 2 (5 per cent) there was a transient exacerbation of fever within seventy-two hours after withdrawal of the drug. After the first day's treatment in the control group there was a fall in temperature in 14 (35 per cent) cases, while an equal number showed a rise in temperature after routine treatment in bed had been instituted.

When the temperature remained below 102 F there was no significant difference in the duration of fever between treated and control groups. However, the difference was considerable among those whose maximum temperature was 102 F or over. In these cases fever persisted for only one to two days in 60 per cent of the treated group as compared with 10 per cent of the controls, for three to five days in about 30 per cent in each group and for more than five days in about 10 per cent of the treated group as compared with 60 per cent of the controls. The average duration<sup>4</sup> of fever after the first day's treatment had been instituted was 1.6 days in the sulfadiazine treated group and 4.2 days among the controls.

In cottage Y, the test period began on Jan 19, 1942 during the latter part of an outbreak of severe acute respiratory infections with a high incidence of pneumonia and acute bronchitis. During a two week period of observation from January 19 to January 31 there were 18 cases, 9 each in the control and sulfadiazine treated groups.

In the sulfadiazine treated group of cottage Y, the temperature of every patient treated for at least one full day dropped within twenty-four hours. On the second day of illness, all but 1 had temperatures below 100 F throughout the day and did not appear toxic. In 1 patient pneumonia was suspected at the onset, and the child was transferred at once to the hospital after an

3 The typing was done by the Pneumonia Division of the Department of Health of New York City.

4 In the calculation of the average duration of fever illnesses of ten days or longer were each considered as ten days to offset the influence of extreme values. This favored the control group which had 6 cases as compared with 1 in the sulfadiazine treated group.

nitral dose of 1 Gm of sulfadiazine had been given. Two patients had secondary rises in temperature for one day on the fourth and sixth days respectively, within twenty-four to forty-eight hours after discontinuation of sulfadiazine.

Of the 9 control patients, only 2 recovered promptly after the first day's observation. The others were quite sick for a few days, they were restless and apathetic and refused to eat. They lost considerable strength and weight during the illness and had a prolonged convalescent period. Two control patients were sent to the hospital 1 on the fourth day of illness with an acute bronchitis of undetermined etiology, the other on the first day of illness with bronchopneumonia attributable to pneumococcus type V. This same type of pneumococcus was responsible for at least 2 other cases of pneumonia in the early part of the outbreak.

On February 21 a second outbreak of respiratory infections occurred which affected 12 inmates within ten days in cottage Y. They all had a nasopharyngitis with considerable coryza, a few also had bronchitis. There were no cases of pneumonia and little evidence of toxicity. Most of the affected children were usually active and playful and maintained good appetites throughout these illnesses.

The dramatic drop in temperature that was observed within twenty-four hours after the use of sulfadiazine during the first outbreak did not occur with the same regularity again. In 2 cases the initial infection did not seem to be modified by the use of sulfadiazine, and the temperature remained high for three days. In one of these cases the sulfadiazine level on the third day was 5.1 mg per hundred cubic centimeters and in the other case it was 3.8 mg per hundred cubic centimeters. At the end of five days the temperature was normal and remained normal. The controls recovered without difficulty except for 2 patients. One had a nasopharyngitis of undetermined etiology while the other had an acute bronchitis attributable to pneumococcus type V. Significant organisms were isolated in only 2 other cases—pneumococcus type XI A (Gorman) in one and *Streptococcus hemolyticus* in the other. Single throat smears in the early acute stage in the remaining 9 cases were negative.

After the first day's treatment, the blood level of free sulfadiazine<sup>5</sup> usually varied from 4 to 6 mg per hundred cubic centimeters during the period in which the drug was employed. The maximum level reached as 12 mg on the fifth day of treatment in a child weighing 47 pounds (21 Kg) and receiving 1.5 Gm daily. With the dosage employed there were no gross ill effects except for a transient rash which developed in 1 case after five days of treatment.

#### COMMENT

Preliminary study on the use of sulfadiazine at onset of symptoms of respiratory illnesses, it was found that most of the patients receiving sulfadiazine improved after twenty-four hours, a few had a secondary rise in temperature within seventy-two hours after premature withdrawal of the drug and no evidence of improvement. At twelve hours after treatment was begun there was no perceptible difference between control cases. Within twenty-four to thirty-six hours, however, there were usually signs of improvement in the treated group. The temperature remained low. The patient appeared less toxic.

<sup>5</sup> Determined through the courtesy of Dr. Jesse G. M. Bullowa at New York.

His appetite returned and he was no longer restless and apathetic but brighter and more cheerful. Signs of infection, such as coryza and cough, still persisted in many cases, but the infection appeared to be subsiding, as if the inflammation had abruptly passed the acute stage. Most patients showed no exacerbation of the infection when the drug was discontinued after four days of treatment. Some children, particularly those who appeared to be seriously sick at the onset or who had persistent discharge and other evidence of infection, required treatment beyond the four day period. Premature withdrawal of sulfadiazine in these cases resulted in a secondary rise in temperature within seventy-two hours, which usually dropped to normal on reintroduction of the drug. On the whole therefore, the infection usually appeared to be checked within twenty-four to forty-eight hours after administration of the drug and usually remained under control.

On the other hand the course in the control group was unpredictable. An occasional patient with high fever at the onset quickly recovered, while other patients who started with low temperatures developed secondary complications. In general, although most of the control children recovered promptly and without complications, some did not, while 1 died. There was usually no way of foretelling the outcome in this group. Those whose temperatures remained below 102 F usually did as well as those in the treated group. However, there was no way of telling who would have a rise in temperature, when it would occur and what the course of infection would be.

In one small outbreak of relatively mild infection of the upper respiratory tract, the course of the initial infection did not appear to be modified by the use of sulfadiazine. A secondary rise in temperature was not noted. It is a reasonable assumption that this outbreak was due to some agent, probably a virus, not susceptible to the action of sulfadiazine.

The favorable results obtained with sulfadiazine are attributable to its effectiveness against many of the pathogenic organisms which are active in acute respiratory infections. The role of these infecting agents in producing respiratory illnesses under various conditions is not thoroughly understood at present. Any measure, however, which is effective against the pathogens at their source should contribute to the control of these infections. The extent to which respiratory infections can be safely controlled by the use of sulfonamides remains to be investigated on an etiologic basis.

#### SUMMARY AND CONCLUSION

Clinical observations on the value of sulfadiazine when administered at the onset of recognizable symptoms of respiratory illness in a highly susceptible group of mentally defective children—the group being divided into 54 children treated with sulfadiazine and 55 control patients observed between Dec 14, 1941 and March 2, 1942—show that usually those treated with sulfadiazine appeared less toxic after twenty-four hours and recovered more promptly than the controls. In some cases, however, the initial infection was not modified by sulfadiazine therapy in the dosage employed.

Judging from these preliminary observations among highly susceptible children, it appears that sulfadiazine can be advantageously employed early in the course of many acute respiratory illnesses. In some cases such a procedure might be an early form of therapy, in others a prophylactic measure.

HEREDITARY DEFORMING  
CHONDRODYSPLASIAB. T. VANZANT, M.D.  
AND  
FRANCES R. VANZANT, M.D.  
HOUSTON, TEXAS

Hereditary deforming chondrodysplasia<sup>1</sup> is a distinct clinical entity, easily recognized and presenting an unmistakable clinical morphologic, histologic and roentgen appearance. It is a relatively rare condition.

The first recorded case<sup>1a</sup> appeared in a Guy's Hospital report in 1825, the first in American literature, not until Gibney's<sup>2</sup> report in 1875. Since the publication of two excellent papers by Ehrenfried<sup>3</sup> in 1915 and 1917, the number of reported cases has increased many fold. Most clinicians still fail to recognize this condition. Textbooks of pathology make brief mention, and medical dictionaries confuse it with other conditions.

## NOMENCLATURE

It is our belief that the undeserved slighting of this interesting condition is due largely to the unfortunate habit of each writer's devising a new name for the condition, based on some clinical or pathologic peculiarity or other whim. While it is obviously desirable for names of diseases accurately to describe them, a still more important function is that their names should identify them. In a not too comprehensive survey we found the following appellations for this disease: multiple exostoses, multiple cartilaginous exostoses, multiple cancellous exostoses, multiple congenital osteochondroma, chondral dysplasia, diaphysial enchondrosis, laminated exostoses, ossified diathesis and dyschondroplasia, in addition to the designation used in this paper, hereditary deforming chondrodysplasia. We have arbitrarily accepted this title.

## DESCRIPTION OF THE DISEASE

Ehrenfried calls attention to the three most striking features of the disease by stating that it is "characterized by (1) the occurrence of multiple more or less symmetrical cartilaginous and osteocartilaginous growths within and upon the skeletal system, generally benign, and resulting from a disturbance in the proliferation and ossification of the bone-forming cartilage, (2) the occurrence of certain typical secondary distortions and deformities of the skeleton, and (3) the demonstration of inheritance in a large proportion of the cases." In the light of present knowledge we would amend his definition by saying that the pathologic picture is that of a disturbance in bone development most noticeable in the metaphysial ends of the long bones and leading to expansion of the ends, profound alteration in their architecture and the development of cartilaginous masses within the bone (enchondroma) and projecting from

it (exostoses), and also narrowing and irregularity in the epiphysial cartilages, which tend to unite prematurely.

The most prominent feature is the presence of bony outgrowths. They take the form of cartilaginous knobs, spurs and pedunculated masses, which may attain a large size. Structurally these protuberances are cartilaginous in the beginning, but, as they become larger and older, cancellous bone forms in the center so that they may be designated either as chondroma or osteochondroma, depending on the stage of development. McCallum<sup>4</sup> states that they "appear about epiphyses in young persons and are left along the shafts as the bone grows." Histologically the growths are identical with exostoses due to trauma or infection, but the associated metaphysial disease distinguishes it from the other condition.

The entire metaphysis is expanded, producing a typical trumpet-shaped or boxlike end best developed at the lower end of the femur and the upper end of the tibia. Trabeculation is distorted and irregular and calcification is not uniformly dense. Throughout the substance there may be bubble-like vacuolations resembling bone cysts when seen on the roentgenogram. These are the sites of enchondromas. They are more common in the small bones of the wrist and ankle than in the long bones.

Irregularities in shape and structure are usually present in the epiphysial cartilages. They tend to unite prematurely with the shaft, producing the shortening and dwarfing so often seen in the cases of more severe involvement.

There is a great tendency for bony fusion to occur between the lower ends of the tibia and fibula and of the ulna and radius. Since there is commonly a difference in the degree of arrest of growth in the fused bones, various deformities are brought about, such as changes in direction of the articular surfaces, dislocations and false articulations and bowing and spiral twisting of the shafts. There may be ulnar displacement of the wrist, or "clubhand." Knock knees and valgus deformities of the foot are often striking.

The exostoses produce remarkably little interference with function because of their peculiar tendency to point away from the joint. However, when they are of large size they may be not only inconvenient but actually harmful if they press on nerves, the spinal cord, blood vessels and other structures. They may block the birth canal in parturient women. The tumors themselves are painless but surrounding and overlying tissues may become inflamed and tender because of trauma.

Although the exostoses are the most prominent lesions, and they are usually responsible for the patient's seeking medical advice, the disease is not to be diagnosed on their presence alone but rather on the complex picture of disturbed growth, of which the exostoses are only one evidence. In fact, exostoses are not invariably present, for Blount<sup>5</sup> described what appears to be an authentic case in which they were absent, and Alley<sup>6</sup> found diaphysial changes in the youngest child of an affected family, which he believed constituted a preexostotic stage.

[1] NOTE.—The nomenclature of the disorders discussed in this paper has been studied in connection with the recent revision of the Standard Nomenclature of Disease. The entries in the book do not conform with the recommendations in this paper, e. g., dyschondroplasia is preferred to chondrodysplasia, and multiple osteocartilaginous exostoses is not considered an identical disease.—Ed.]

## PROGNOSIS

The disease is distinctly one of growth. Lesions may be present at birth or develop during childhood, but as maturity is attained they become inactive. It is even claimed that some of the lesions regress in later years. Pedunculated tumors however may continue to grow for many years during adult life. Rapid increase in size and the onset of pain suggest that sarcomatous changes are appearing but such changes occur in a very small percentage of cases, probably less than 5 per cent.

## HISTOGENESIS

It was long believed that the lesions were limited to those bones which embryologically arise in cartilage. On the basis of this belief a number of theories of histogenesis have been evolved. Keith<sup>7</sup> pictures the defect as arising from the failure of diaphysation or tubulation which leaves a broad unmolded zone of bony tissue between the growing end and the shaft, from which protuberances grow "as a secondary result of the primary disorder of growth."

Geschickter's<sup>8</sup> view is that there is a defect in the development whereby islets and strands of primitive cartilage persist throughout the metaphysis. Their growth produces masses of cartilage which distort the architecture of the bone and which tend to grow outward and to project through defects in the overlying, limiting periosteum thereby producing exostoses.

Both theories locate the defect at the stage of transition from cartilage to bone. Neither view can be harmonized with the finding of changes in bones which arise directly from primitive membrane without the intermediation of cartilage, yet there are a number of instances of exostoses arising from the skull bones and Mahorner<sup>9</sup> describes a fine mottling of the skull due to irregular calcification in 1 of his cases.

It seems to be more in keeping with the facts to assume that there is an inherited defect in the primitive anlage for both cartilaginous and membranous bone producing disturbances of bone formation which are expressed as growth occurs and hence are most pronounced at the points at which growth is most active, namely at the growing ends of the long bones. The comparative immunity of carpal and tarsal bones, vertebrae and the bones of the skull is due to their slow rate of growth. Similarly, the phalanges are less often and less severely affected than the femur simply for the reason that phalangeal growth is to be measured in millimeters whereas the growth of the femur is measured in centimeters.

The distribution of lesions supports this belief for we find that the most frequent and extensive involvement occurs at the ends of the femur, tibia, fibula, radius, ulna and humerus.

## DIFFERENTIAL DIAGNOSIS

The differential diagnosis of this disease from benign and malignant neoplasms, traumatic exostoses, multiple myeloma, rachitis and tuberculous, syphilitic and chronic infectious osteomyelitis and periostitis presents few problems if the distinctive features of hereditary

deforming chondrodysplasia are recalled: the expanded metaphyses, multiple exostoses, frequent endostoses, the characteristic distribution of the lesions, the shortening, torsion and deformities of the long bones and frequent fusion of the ulna with the radius and the tibia with the fibula and the history of similar deformities in other members of the family.

The disease is more difficult to differentiate from some of those rare bone conditions whose distinguishing features are not clearly defined and descriptions of which are not available in most reference books. We must also include in the list a number of conditions which present no clinical similarities but whose designations are so similar as to require definition. A few of these conditions will be described briefly.

Ollier's disease is considered by many to be a sub-variety of hereditary deforming chondrodysplasia. Differentiating points are the unilateral or asymmetrical distribution, the large number of enchondromas, infrequent exostoses and moderate enlargement of the diaphysal ends. Heredity is not a striking feature.

In Albers-Schonberg disease, variously called osteopetrosis, osteocretosis, osteosclerosis, fragilitas or osteosclerosis with anemia, exostoses occur but are not common, and the metaphyses may be expanded but not so much as in chondrodysplasia. They show stippling with densely opaque deposits. The lesions are not limited to the ends of the bones but involve the shaft as well.

In Voorhoeve's disease there may be metaphysal enlargement and some exostoses. The condition is distinguished by fine longitudinal striations due to incomplete calcification.

Osteodystrophia fibrosa is characterized by precocious puberty, a yellowish pigmentation of the skin and a progressive generalized fibrocystic disease of the skeleton. The clear cystic areas may be confused with the vacuolations due to the enchondromas of chondrodysplasia.

Osteodystrophia fibrosa unilateralis of Freund is characterized by facial dyssymmetry, unilateral distribution and involvement of the whole diaphysis as well as the metaphysis. The roentgen appearance is that of a diffuse cystic change and is due to resorption of bone along the haversian canals. The parathyroid function is normal.

Achondrodysplasia is a disease primarily of the epiphyses which unite prematurely with the diaphyses, producing dwarfs with very short extremities and normal trunks.

Chondrodystrophia, or Morquio's disease, is more closely related to achondrodysplasia than to chondrodysplasia. There is early cessation of growth of the epiphyses and a flattening of the vertebral bodies leading to severe kyphosis and great shortening of both trunk and extremities.

The osteochondritides include a group of dystrophies of the epiphyses. When the process is confined to the head of the femur it is known as Calve-Legg-Perthes disease, when limited to the tibial tubercle it is called Osgood-Schlatter disease, involvement of the scaphoid, tarsal or second metatarsal bones is known as Koehler's disease or Freiberg's infarction, and disorder of the vertebral epiphyses constitutes Scheuermann's disease.

Chondro-osteodystrophy or gargovism is characterized by clouding of the cornea, mental retardation,

9 Mahorner Howard R. Dyschondroplasia. *J Pediat* 10: 126 (Jan.) 1937.

enlarged cranium, great distortion of the facial bones, kyphosis, premature epiphysial union and hepatosplenomegaly

In xanthomatosis, or Schuller-Christian disease, there is absorption of the bones especially of the skull and replacement by lipid deposits. Exophthalmos and diabetes insipidus are usually associated.

Osteogenesis imperfecta, osteopsathyriosis, fragilitas ossium or Lobstein's disease is a myeloplastic malacia which may or may not be hereditary. There is a deficiency in subperiosteal bone production.

Von Recklinghausen's osteitis fibrosa and Paget's osteitis deformans are both diseases of cortical bone with fibro-osteoid changes, malacia hyperostoses and giant cell tumor formation.

Familial generalized osteophytosis with tremendous hyperplastic enlargements of the bones of the hands, forearms, feet and lower legs has been described. It is a disease of periosteal bone growth similar to hypertrophic osteoarthropathy, or Bamberger-Marie disease

in 12 of her relatives for examination. Her death, following the removal of a large pedunculated exostosis of the pelvis, terminated our collaboration before the study was complete.

The family is of Scotch-Irish descent. Healthy members are average or above average in height, while affected members tend to be shorter than normal. The family as a whole is above average in intelligence, and many of the affected members hold responsible political and civil positions. They are sensitive about their abnormality and live in fear lest their children inherit it. This apprehension doubtless accounts for the relative infertility of the fourth generation as compared with those preceding. Note that there were 7 children born to the first generation, 25 to the second, 38 to the third and only 6 to the fourth. Cesarean section has been required repeatedly because of dystocia caused by tumors of the pelvis, but infant mortality has not been exceptional. No child has been born with recognizable lesions. As a rule, the tumors appeared about the tenth

TABLE 1—Showing Distinctive Features of Some Rare Bone Diseases

The distinctive features of these diseases have been tabulated for convenience in table 1.

REPORT OF CASES

The following report places on record a family in which 36 members are known to have shown the lesions characteristic of this disease. They illustrate most of the salient features with regard to its hereditary nature, its age and sex incidence and the clinical, pathologic and roentgenologic changes and prognosis.

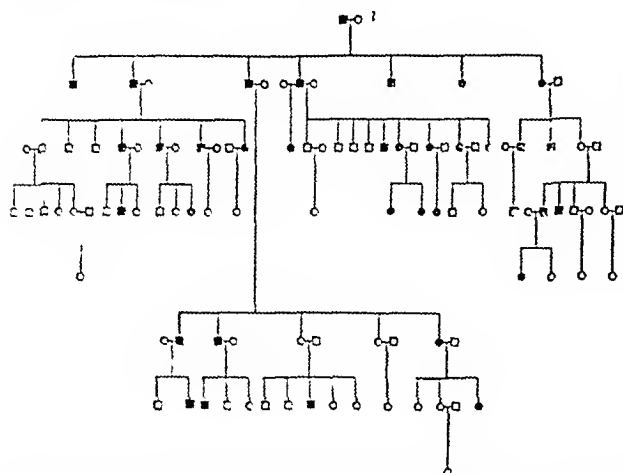

In 1934 an 11 year old boy was brought to the x-ray department of Jefferson Davis Hospital because of a swelling of the upper end of the right humerus. The roentgen examination showed the typical picture of deforming chondrodysplasia. An investigation of other members of the family was instigated. One of the aunts, who proved to be a highly intelligent woman aged 28, became so interested in the condition that she offered to trace its incidence throughout her large, widely scattered family. Her problem was made particularly difficult because members of the family lived in distant localities in Texas and in eleven other states and also because many of the family were sensitive about their abnormalities and sought to conceal them. Eventually she turned over to us the material from which the accompanying genealogy was constructed and brought

year. Since several of the last two generations are still under this age it is possible that the condition may develop in some of them later. In 2 it has done so since this survey was begun, as letters from their distressed mothers informed us.

Seven members have consulted various clinics over the country and have had operations for removal of exostoses, but at none of these clinics was the hereditary nature of the disease recognized—an observation of value in interpreting the statement "negative family history" occurring so often in case reports. In one of these cases the excised tumor was reported to have undergone a sarcomatous change. The woman who aided us in compiling these data had an exostosis which was benign but had caused great inconvenience and had continued to grow even after she had passed her thirtieth birthday.

The general health and longevity of the family were not affected except as has already been mentioned, and there were no other hereditary anomalies or diseases noted. However, cancer was exceptionally frequent in the second generation. Of the 7 persons making up the generation 5 are known to have died of cancer, the sixth lost his life in an accident and the fate of the seventh is not known. The parents of this generation were

first cousins, according to the statement of an aged friend of the family. He claimed further that both were affected with bony tumors but we have been unable to confirm that the mother was affected.

Incidence of hereditary deforming chondrodysplasia in one family. White squares indicate normal males; black squares affected males; white circles normal females; black circles affected females.

It would profit us little to enumerate the details of each case or to describe each lesion since they so closely follow the pattern already described ably and often. Certain factors in the hereditary transmission and sex incidence however, are worthy of special examination.

#### HEREDITARY NATURE

It was early recognized that heredity plays an important part in the etiology of this disease. Ehrenfried found a history of familial involvement in 83 per cent of cases. Physicians however, are apt to be overawed by genetic terms and concepts and are rarely willing to analyze their data. As a result in the English literature one finds hazy references to a strong hereditary or familial tendency but no definite statement as to its character and significance.

In the genealogy presented here the hereditary nature of the disease is strikingly demonstrated. Thirty-six persons in five generations of a family of 78 members are known to have shown the characteristic bony changes, an incidence of 46 per cent.

A careful study of the chart reveals a number of interesting facts:

1 The family springs from a man who is known to have had the disease and who married a cousin who may have been similarly affected.

2 This union resulted in 7 children, all of whom were affected.

3 The next generation produced both normal and affected children.

4 In later generations all the offspring of normal males were normal, but 2 of the 3 normal females gave birth to affected as well as normal children.

5 The affected males and females produced both normal and affected children in approximately equal proportions.

6 In the affected families, the ratio of normal to affected males was 15 to 18 and of females 15 to 17.

The fact that the disease was transmitted to one half or more of the offspring of the affected families suggests that the transmission was by means of a dominant gene. This assumption is strengthened by the fact

that the disease was transmitted to 100 per cent of the offspring of a consanguineous couple of whom the father surely and the mother probably was affected. Further support is found in the failure of normal males to transmit the anomaly to any of their children. The fact that 2 of the normal females did transmit it does not conform to the rule for dominant characters but it does not invalidate this interpretation, since neither of these women was subjected to an actual examination. It is therefore possible that they had bony lesions which they concealed or which were so slightly developed as to have escaped observation. In the literature we find a number of instances of nonaffected women bearing affected children, but in not a single case was the woman actually examined. More convincing evidence is needed.

#### SEX INCIDENCE

It has been repeatedly stated that the disease is more common in males than in females by a ratio of about 3 to 1. To test the validity of the observation we have examined the relative proportion of normal and affected males and normal and affected females in families in which all members have been recorded. Table 2 summarizes these data from a number of sources. In making the counts we considered only the siblings from affected families or subfamilies in which the data were complete and the sex of each member was stated.

There were 455 persons in all, almost exactly one half of whom were affected. Of these, 144 were males and only 86 were females, a ratio of 1.7 to 1. Because there happened to be more males than females in the series, this ratio is a little too high. Since 144 out of

TABLE 2—Summary of Data from Various Sources Showing the Incidence of the Disease in Siblings of Patients with Hereditary Chondrodysplasia \*

\* Only families in which the data were complete have been included.

237, or 60 per cent, of all the males were affected and only 86 of 218, or approximately 40 per cent, of females, the corrected ratio is 60 to 40, or 1.5 to 1.

While this is much lower than the ratios previously reported, it is puzzling to understand why there should be even this degree of lessened susceptibility of the female as compared to that of the male. It may be that

our data are incorrect, since often they were based on hearsay evidence. Leg of mutton sleeves, voluminous skirts and Victorian modesty of yesteryear may have concealed many feminine secrets. Or it may be that the disease tends to be less severe in women than in men and hence more likely to be overlooked. There are a number of reported instances in which lesions were not suspected until roentgen examination disclosed their presence. On the other hand mere femaleness does not guarantee mildness of the manifestation, for the disease can be extremely severe and widespread in females. Perhaps factors other than inheritance influence the development of the lesions, factors which may be more active in males than in females, such as trauma, infections, hormones and vitamin deficiencies.

#### SOCIOLOGICAL CONSIDERATIONS

The prognosis of the disease is usually favorable for the individual, but what is the prognosis for the race?

Once an abnormality has arisen as a result of a gene mutation, it continues to perpetuate itself indefinitely. In other words, affected members of the family continue to procreate affected children. Since the abnormality is not lethal, there is no biologic reason why it should not be perpetuated through the ages from generation to generation, although natural selection and eugenic birth control may cause the strain to die out. It is also possible that through some mechanism at present not understood the character may lose dominance and so pass on as a recessive character, undetected for generations only to become dominant again at some future time. There is an interesting genealogy cited by Sinnott and Dunn<sup>10</sup> in which the transmission of hereditary rigidity of the fingers was traced in a direct line for more than five hundred years through fourteen generations.

We know that the disease arose originally as a gene mutation, and the question arises: Was there only one such mutation? Have all present affected patients descended from one common ancestor or have there been many such mutations giving multiple foci of origin in different countries and among different races? This question is impossible to answer. We know that while mutations occur continually the chance of a given mutation recurring frequently is not great. On the other hand, shifting of populations and intermarriage allow wide dissemination within a few generations. The family reported here in five generations multiplied from 2 persons to 78, who are now scattered over at least twelve states. In a few more generations an infinite number of untraceable connections will have been made. Although the disease has been reported as occurring among many nationalities, including Jews and Negroes, human pedigrees are poorly documented, and it is not inconceivable that all persons with this disease are descendants of a common ancestor who, long ago, suffered a mutation of one of his genes.

#### SUMMARY

In five generations of a family of 78 members, 36 persons are known to have had hereditary deforming chondrodysplasia. The disease is transmitted as a mendelian dominant.
